The course plotted out was by no means easy to follow, though, of course, local knowledge on occasion was bound to assist the competitors out of a difficulty. Along narrow and intricate lanes, twisting left then right, the different teams wended their way, an occasional compulsory halt at a level crossing giving the riders a chance to take their bearings from the maps very carefully. Fifteen miles per hour was the average called for, only the last man home of each team being timed. Although never more than seven or eight miles from the centre of Coventry, a number confessed that they had travelled over roads they had never seen before. Three complete teams arrived back at the start in remarkably prompt time, the distance covered being approximately thirty-three miles. The "A" team, which won, was only a second or two out, the members of the team being: A. Wright (two-stroke Triumph), S. Wright (2¾ Humber), and G. Smith (10 Stellite).

Acton and District M.C.C.

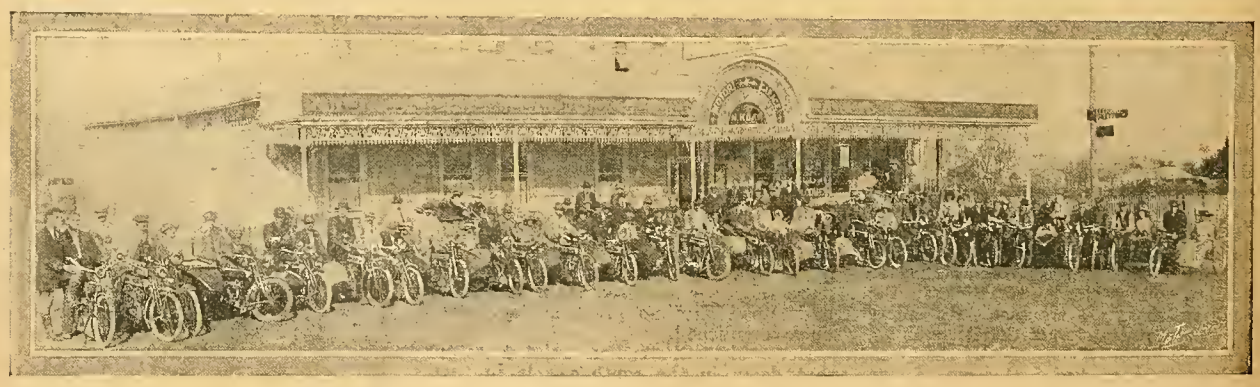
A club is being formed at Acton with the above title. Those who are interested are asked to communicate with Mr. E. B. Hunt, 47, Woodfield Crescent, Ealing, W.

Wolverhampton M.C.C.

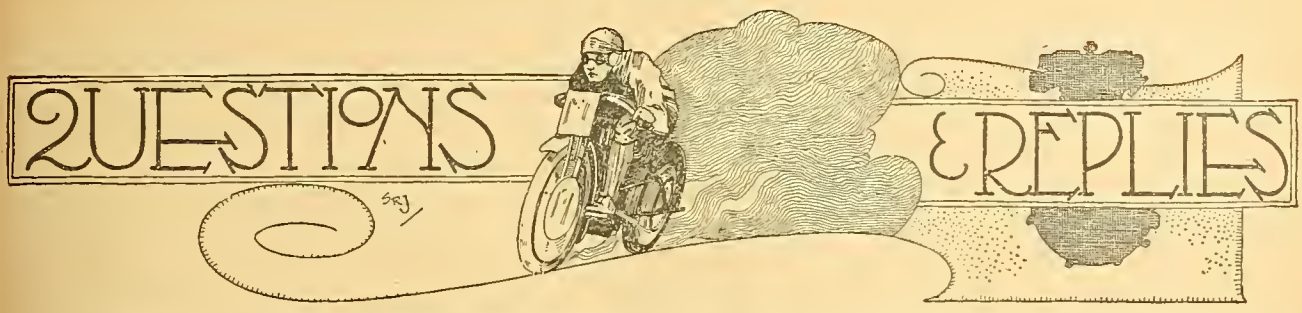
A change of headquarters has been made to the Talbot Hotel, King Street, Wolverhampton. The secretary is now Mr. A. O. Haskins, 15, King Street. All competitions have been indefinitely postponed owing to the European War.

Lincolnshire A.C. (Motor Cycle Section).

A reliability trial for the Wright challenge vase will be held on the 29th inst. over the following route: Wragby, Elkington Corner, Binbrook, Caistor, Market Rasen, Tealby, Elkington, Binbrook, Caistor, Market Rasen, West Torrington, and Wragby. The start will be at 2.30 p.m.



The Fitzroy Motor Cycle Club (Melbourne). This group gathered together for the first annual picnic to Wallan, nearly a hundred taking part. Sidecars, it will be noticed, formed an attractive feature of the day.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Steels for Various Parts.

I should be glad to know the correct kind of steels for making the following parts: (1) Wheel spindles, (2) cones, (3) nuts, and (4) valves.—J.W.C.

You should use the following steels for the parts you enumerate: (1) Carbon steel, (2) case-hardened steel, (3) mild steel, (4) tungsten or vanadium steel; probably the former is the best for the purpose.

Rust on Exhaust Pipes.

Can you tell me of any method of preventing the exhaust pipes of an engine from rusting? These have not been plated and great flakes of rust regularly appear, and, at the present rate, they will soon rust right through. I have tried blacklead, but this does not appear of any use. Enamel also is useless, as the heat destroys it and it falls off.—B.E.E.

There is no preparation which will keep the exhaust pipe from rusting, as heated iron oxidises very rapidly. Repeated applications of blacklead are all we can suggest, or you might have the pipe nickel-plated. This looks nice, but it is believed to be less efficient from a cooling aspect than if left unplated, but we do not think this is anything to worry about.

Paraffin Mixed with Petrol.

I find the page in *The Motor Cycle* devoted to "Questions and Replies" one of the most interesting and instructive in the whole of your paper, and I now wish to ask a question myself. My machine has an 8 h.p. J.A.P. engine with Amac carburetter (29 jet). As I am anxious to use petroleum or a mixture of it and petrol, will you tell me if a 29 jet is large enough, and would the float level need to be altered?—R.L.A.

In using a heavier spirit the float may need to be weighted very slightly by placing a washer on top of it, but this is not always necessary. About one-third paraffin and the rest benzole is a good mixture. In the case of paraffin and petrol mixed, you can quite well run on a half and half mixture. This will effect considerable economy and give quite good results, the only drawback being that the odour of the exhaust may be rather unpleasant. Unless a 50% mixture of paraffin be used no material economy is effected.

Paraffin as a Fuel.

My machine is of 2¾ h.p. with a B. and B. semi-automatic carburetter, and I expect to take it out to the Argentine soon. The temperature there is in summer mostly like our hottest days here, and in winter like our cool summer days. (I am thinking of the Province of Santiago del Estero.) Owing to the price and difficulty of procuring spirit, I would like to know if you think it would be practicable to run the machine on kerosene, and what I would have to do to adapt the carburetter. Also, if such procedure will injure the engine. Will you also tell me if it is possible or desirable to run on naphtha?—J.J.T.

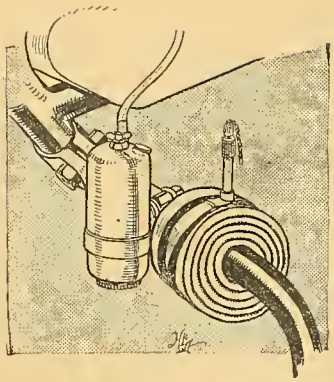
We do not think it advisable to run a machine on the crudest kerosene, but you might use ordinary paraffin instead and carry a small reserve supply of petrol for starting purposes. With a very little alteration in the petrol level of the carburetter quite satisfactory running could be obtained on paraffin. The great objection to paraffin as a fuel is that it is messy and tends to run all over the machine. We have had no experience at all of running a machine on naphtha, so cannot tell you whether it will be desirable or otherwise.

Northampton to Weston-super-Mare.

I shall be obliged if you will let me know the best route from Northampton to Weston-super-Mare, missing bad hills and traffic as much as possible. Approximately, what is the distance?—J.P.

You will find the following route to be a good one: Northampton, Towcester, Brackley, Oxford, Faringdon, Swindon, Wootton Basset, Chippenham, Bath, Marksbury, Stowey, Compton Martin, Priddy, Cheddar, Axbridge, Weston. We have given you the route through Cheddar Gorge, which is very pretty, but if you want to go direct go through Compton Martin, Banwell, and Blagdon.

ON ACTIVE SERVICE. Despatch riders awaiting orders.



A method of carrying a separate generator and spare tube on the front suspension tube of a sidecar.

Sheffield to Morecambe.

Will you kindly advise how best to proceed between Sheffield and Morecambe?—J.W.

We should advise you to go from Sheffield, through Oughtibridge, and then straight through Huddersfield, and afterwards through Elland, Halifax, Keighley, Skipton, Settle, Wennington, Lancaster, Morecambe. Of course, you must expect to pass through some unpleasant country between Huddersfield and Halifax, and, in fact, a great part of the entire route is through populous districts as far as Lancaster, after which the road is delightful.

A Mysterious Complaint.

Will you kindly assist me to locate a trouble with my engine, a 500 c.c. horizontal twin? The trouble is overheating and the engine refusing to climb easy gradients on top gear. When I start out from cold, I run perhaps three or four miles, and then, approaching a hill, the engine slows up and gives up altogether. After cooling it gets away again all right, but develops the trouble again on the next rise. I also get "popping" in the carburetter. I might add that when approaching a hill I open out a bit, and as soon as it slows, I retard, close air gradually, and then drop into low gear, but without any good effect. I have tried the following to cure the trouble: (1.) Back cylinder taken down, cleaned all carbon away, freed the rings. (2.) Examined valves and tappets, for clearance, etc. (3.) Reduced jet orifice. (4.) Advanced magneto one tooth. (5.) Overhauled lubrication (when descending hills with exhaust raised, the engine smokes, which seems to show it gets the oil all right. (6.) Tried several plugs.—E.W.W.

We cannot suggest what is the matter with your machine at present, as you seem to have gone over everything that would be likely to cause the symptoms from which you are suffering. Did you examine the valve clearance of the engine when it was really hot? There is just a chance that one of the valves might have been kept open—possibly the inlet valve—as you complain of popping back into the carburetter. There is another point which we think might cause sluggish running, and that is, condensation of petrol in the long inlet pipe itself. If you were to make some arrangement by means of which you could jacket this pipe a marked improvement in the running would probably be effected. If you try experiments in this direction you might let us know what the result is, as doubtless they would prove of general interest.

Conduction of Heat to Crank Case.

Should the crank case of a motor cycle engine get so hot that you cannot hold your hand on it for more than a few seconds, and, if so, what damage is likely to be done by running the machine? The power of the machine in question does not seem to wane at all.—F.B.

Heating of the crank case will always take place up to a certain point through conduction. Should it so happen that the rings are slack, and blowing back takes place, a great deal of power will be lost, and the cause of overheating can in this case very soon be traced. In your particular case, where the power is not lessened in any way, we should say that the overheating from which you suffer is simply due to conduction.

A Question of Taxation.

I own a motor cycle already, but have just purchased another one from a friend who had to give up riding. This machine I bought solely because it was a bargain, and I mean to sell it again. While I have the machine have I to take out any licences for it? I shall not make any use of it while it is in my possession, as I shall only ride the machine I had already, for which, of course, I have the licences. —L.V.

If the machine is used at any time to give a demonstration to a possible purchaser or is used while your own machine is temporarily laid up, you are bound to pay a local taxation licence for it. If, however, it is not taken on the road while in your possession, you will be exempt from the licence.

Some Questions re Gears.

I should like your advice on a few questions concerning change-speed gears. I have just ordered an 8 h.p. machine fitted with a three-speed hub gear, and I should be pleased if you would enlighten me on some details concerning it. I have been told of three different ways to change gear while travelling. One says close the throttle for a moment while changing, another says use the exhaust valve lifter, and the third advises me not to do anything but just change gear as quickly as possible. Which of these ways is correct? Is an epicyclic gear a gear that gives direct drive on top, and does this type of gear revolve as a solid body when on top? What particular kind of lubricating oil is required for a hub gear, and what would be the different ratios with a 4 to 1 and 3 to 1 top ratio?—ENQUIRER.

The best method to follow in changing up is to lift the exhaust lever a moment, but when changing down all that is necessary is to move the gear lever smartly into the next notch. Yes, the gear revolves as a solid mass when running on top ratio. You can lubricate the gear with ordinary engine oil, and many riders do so with quite satisfactory results, but a thinner oil sold for the purpose is better for the clutch. With a top gear ratio of 4 to 1 the ratios in a hub gear would approximate to 4, 6, and 9 to 1, but this depends upon what make of gear is fitted.

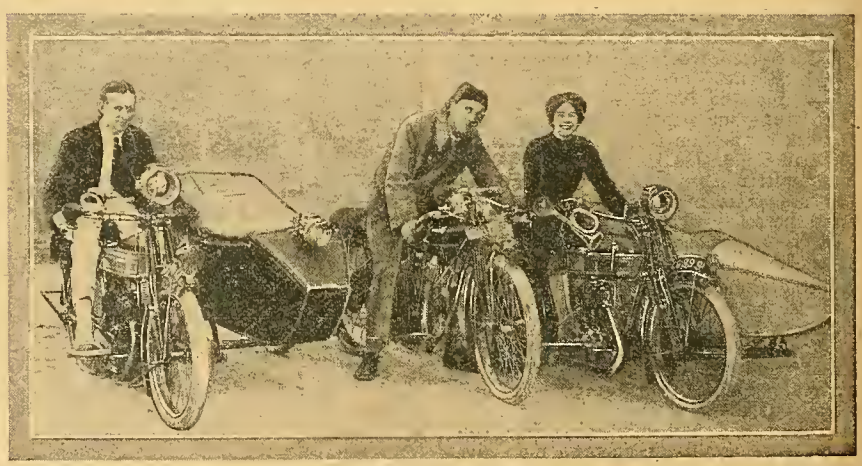
EXPERIENCES WANTED.

"J.B.W." (Pretoria). — Binks carburetter on a 4 h.p Bradbury. Petrol consumption; etc.

"E.P." (Petone).—Reliability of P. and M. sidecar and Rudge sidecar for use with 3½ h.p. Rudge-Multi.

"C.W.M." (Cambridge). — 3½ h.p. Douglas. Speed, petrol consumption, lubrication, both solo and with sidecar.

"G.J." (Salop).—Wizard. Reliability, hill-climbing powers, petrol consumption, ease of starting, and average speed over give and take roads.



A West of England group mounted on Rex (two) and Indian machines. The lady on the right, Mrs. Dewen Wotton, of Plymouth, whose present mount is a 4 h.p. Rex and sidecar, has ordered an Indian and a Levis, and hopes to win some of the West of England hill-climbing events

L·M·C·

The most successful motor cycle of the year

Successful in every reliability trial in which it has competed. The record is 22 awards out of 22 entries in 15 events.

Gold Medals in the English, Scottish, and Irish Trials, and the Manufacturers' Cup and 3 Gold Medals in the London-Edinburgh Trial.

Equally successful in the service of private owners all over the world, of which the following provides evidence.

AT HOME.

"Speed and pulling power nothing less than marvellous; my 4 h.p. touring model second fastest in fast hill climb, only beaten by 8 h.p. machine by 1¼ seconds."—T. W. H., Northumberland, 30/4/14.

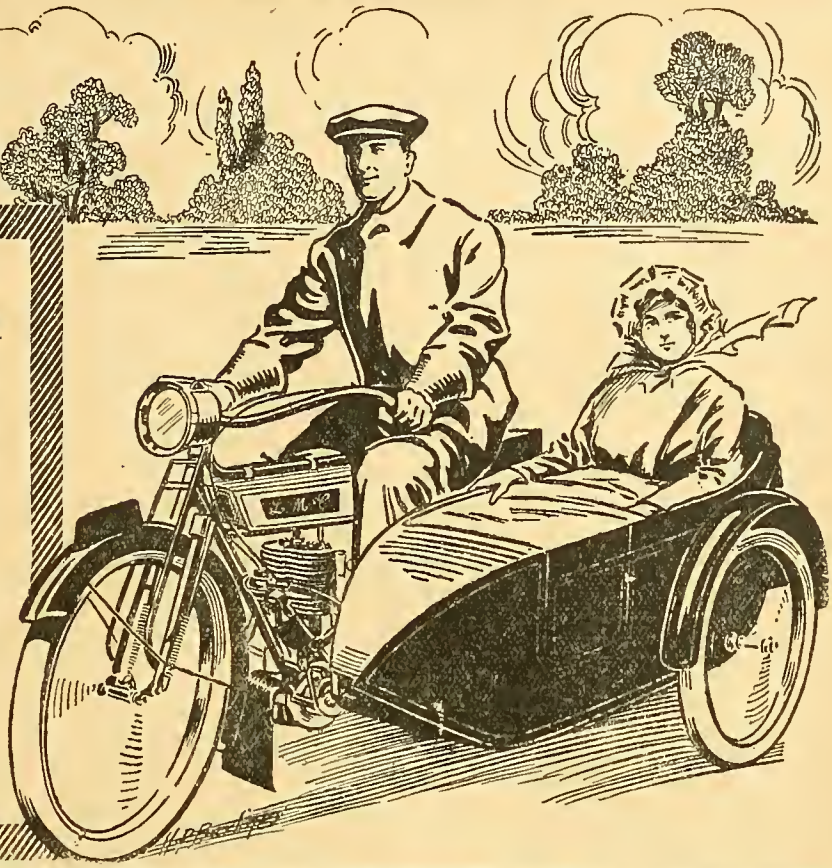
ABROAD.

"My L.M.C. behaved splendidly; has carried me over hills and through sand that riders of other machines had to get off and push."—V. B. C., Australia, 25/6/14.

The secret of the great power and speed of the L.M.C. is in its scientific construction. The chain drive for low gear and the sweet belt drive for high gear is ideal.

PROMPT DELIVERY OF HOME AND COLONIAL MODELS

LLOYD MOTOR ENGINEERING CO., LTD., 132, Monument Road, BIRMINGHAM.



YOU WON'T

PULL A WRY FACE

OR EVER BE SADDLE SORE, IF YOU RIDE AN

XL-ALL

as it springs more than any other saddle, is perfectly anatomical, cannot roll sideways or hit you back by bouncing, neither can it bend your spine by dropping at the back only like others do Works, Hall Green, Nr. Birmingham.

ROTHERHAM & SONS Ltd.,

COVENTRY.

Telegraphic Address: Rotherhams, Coventry.

Telephone No. 14.

Manufacturers of

HIGHEST GRADE ACCESSORIES

FOR MOTOR BICYCLES, Viz.:—

Brass Taps, Lubricators, Grease Cups, Automatic and Hand Oil Pumps, Carburatters and parts for same, Unions. Ball Valves Filters, Squirts, Strainers, etc.

TRIUMPH PATENT SQUIRT.

The advantage of this Squirt is that it is collapsible. When the spout is drawn out, it is fixed in the end of barrel by screwing, so making it rigid.

PRICE 3/6

Above can be had from any Motor Cycle Agent or Accessory Dealer.

Bournville Chocolate!

A packet of Bournville Chocolate makes a splendid lunch for the motor cyclist in a hurry. It is nourishing and stimulating, easily digested and delicious to taste.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. ooo, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

☞DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.J.S.

A.J.S., 6h.p., 1914, in stock; immediate delivery.—Madgwick's, Knowsley St., Bolton. [X8513

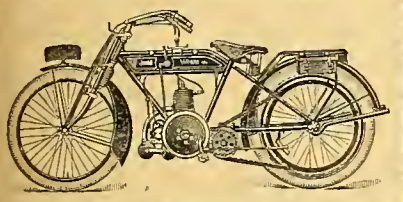
"JUNO" MOTOR CYCLES AND SIDECARS

ARE THE VERY BEST.



One of the many testimonials from riders of Juno Motor Cycles.

SILVER MEDAL AWARDED.

W. S. Capstick, Esq., 620, Manchester Road, Bradford, writes: 22nd July, 1914.

"I have been awarded a Silver Medal in the Bradford M.C.C. Speed Trial, on Blubberhouse Moor, Harrogate (Handicap) with JUNO 2-STROKE, with a speed of just over 38 miles per hour. The machine will really do more, I have got 49 out of it several times."

THE "JUNO" 2½ H.P. TWO-STROKE.

MOTOR CYCLISTS

AND THE

WAR.

THE NEED OF TO-DAY :
COOL HEADS &
COOL ENGINES.

The motor cyclist desirous of getting the very last bit of service out of his engine without running it to ruin must use the

NEW CHEMICO MOTOR CYCLE OIL

It keeps the engine as cool as a cucumber.

Obviates every tendency to gum up.

Admits of starting-up from cold without the use of injections.

Gives vastly greater mileage.

No power wastage.

Lessens wear and tear, etc.

Let us send you copies of testimonials received, expressing astonishment at improved running.

Ask your dealer to supply. If he can't or won't, we will, and pay carriage.

Quarts 1/9 ½-Galls. 2/9

Gallons 5/-

5-Gall. Drums 3/9 Per Gallon.

KEEP COOL,
KEEP THE ENGINE COOL,
AND WIN.

The County Chemical Co., Ltd.,
Chemico Works, Birmingham.

Amalgamate the Car and Motor Cycle Shows.

BRITAIN'S motto, "Carry on," which we have ventilated and supported to the best of our ability, will, we trust, be applied to the Olympia Shows. From what we can gather, the Management Committees of the Olympia Car and Motor Cycle Shows are much exercised in their minds as to whether to hold the exhibitions this year, as heretofore, but our view is that postponement of the Shows this year would be extremely unfortunate. It is certain that there will be no Shows at Berlin or Vienna, though there may be a glimmer of hope that the Paris Show will be held should the war be short-lived. The odds are, however, that the only Show which is at all likely to take place this year will be in England, and it would appear that now is a chance for British trade concerns to seize upon this magnificent opportunity of penetrating new channels and of demonstrating the solidity of British manufactures, even in times of stress such as these. It will in no way benefit France or Belgium if there is no Show in London. Much can happen in the period intervening between now and the dates of the Shows, but it is sincerely to be hoped that events may go so well with the Allied Forces that the Show question may no longer hang in the balance. Should, however, the present stress continue and the financial conditions necessitate an alteration in the original programme, we suggest that by combining the Car and Motor Cycle Shows, a successful exhibition, both financially and as regards public support, would be the result. Great Britain must have a Show, and this is the opportunity. It is even now felt in many quarters that both Shows would receive sufficient support to warrant their being held; but, on the other hand, it would be unwise for manufacturers to strain their finances in supporting two separate Shows which might be but moderately attended, when one "amalgamated" Show would result in a crowded hall and good business, at a much reduced expenditure. Agents would, no doubt, welcome this plan on account of the halving of time and expense. We put this suggestion forward to the organisers as a possible solution of the difficulty with which they are confronted.

Our Trade Overseas.

WITH Olympia, the motor mart of the world, in the balance, the American Cycle Trades Convention has just been held at Atlantic City, N.J. This convention is composed of practically all those engaged in the motor cycle and allied trades in America, and very naturally the convention fell to discussing the war and the likely effects thereof on American commerce. While naturally a grave view was taken, and it was quite realised that any idea of much European trade in the near future was hopeless, the members of the convention turned quite briskly to the prospects of securing business in other parts of the world, *and special mention was made of the possibilities of getting into British Overseas markets*, which the home manufacturers might possibly consider not worth while cultivating during the crisis. This is an important point, for once a seller has established himself on a friendly footing with a buyer, it is not easy to effect a severance.

We are perfectly well aware that, despite the dominance of the fleet over the high seas, shipping facilities are not altogether normal, more particularly in the matter of freights, but still substantial assistance has been promised by Government with regard to war rate insurances, and we think that manufacturers might well make continuous efforts to keep existing and secure fresh overseas trade, even during the course of hostilities.

A hundred years ago England managed to conduct long wars for year after year, and at the same time successfully hold the bulk of the world's trade, and even pay off Funded Debt instead of piling it up. To-day we are just as strong.

SEVERE TRIAL AT THE CAPE.

Real Colonial Test in the Competition for the Continental Cup.

"THE most strenuous motor cycle trial ever held in these parts" was the verdict voiced by competitors who, on the King's birthday, had the pluck to enter for the 115 miles' road trial and face miles of mud and water and typical Colonial roads in the competition for the Continental Cup held by the Cape Peninsula M.C.C.

Until a day before the trial it had been raining continuously for a week, and as a result streams had grown to rivers and the roads had become shocking, and thus only the most courageous entered—eleven riders in all.

The sun was shining when O. M. Lewis (3½ h.p. Humber sc.) led the field, which was despatched at intervals from Salt River, and 20 m.p.h. was the speed fixed. The route turned over the Koeberg Road, where M. Prillevitz (3½ h.p. B.S.A.) was seen pedalling his hardest past the farm Vissershok and over a steep hill, on the top of which the first secret control was met. Lewis failed before reaching the summit, and the Rev. S. B. Priston hereabouts stopped to fasten the stand of his 3½ h.p. horizontal engined Bradbury, thus losing 10 marks. Nearing the village of Durbanville, the latter nearly ran into S. Moralee's sidecar outfit, which suddenly collapsed, and only three of the competitors got through here without a stop. At Kuils River a young man from the veldt assisted Fritchley in his argument with the back tube of his 3½ h.p. P. and M., which delay caused him a big loss of marks.

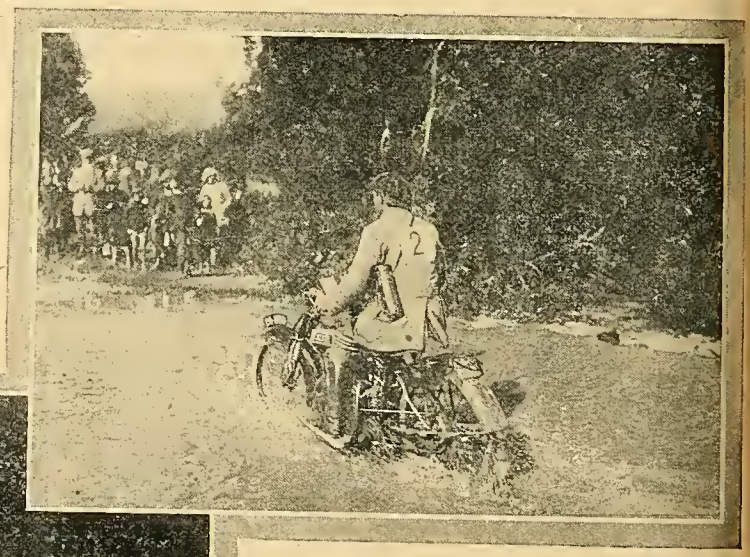
Something like a Watersplash.

An interested crowd, anticipating excitement, had gathered at the foot of Sir Lowry Pass, where the "watersplash" of normal times had now swollen to 25ft. in width and over a foot in depth. The only man to get through was the Rev. S. B. Priston on his chain-driven mount; all the others came to a stop in midstream, and had in some instances to be hauled to *terra firma*.

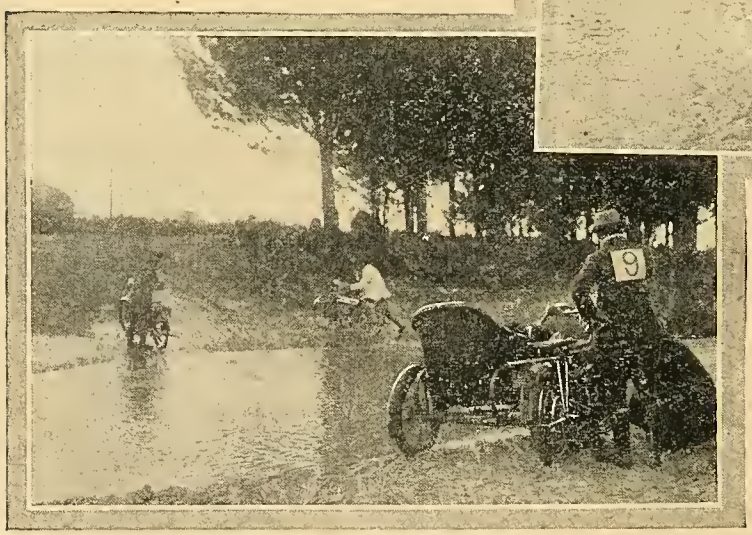
After the luncheon interval at the hamlet, where G. Alexander (6 h.p. Bat sc.) was the last man to arrive, after having been detained by an overdose of tyre trouble and search for a lost speedometer cable, the route led through the picturesque village of Somerset West and the town of Stellenbosch, towards Hel' Hoogte—a steep mountain pass with numerous bends and in parts a frightful muddy surface—the *pièce de résistance* of the day. J. C. F. Myburgh (7 h.p. F.N.) steered through the mud with a good deal of footwork, but on the descent side-slipped twice. Priston passed the observers near the summit all smiles—he had held the cup already for a year. Coasting down, contestants were suddenly faced by a stretch of thick greasy mud, that proved the undoing of many. Near Pniel, E. W. Watts (6 h.p. Enfield sc.) effected a smart repair to the timing gear, while further on towards Drakenstein, F. Meredith, riding a similar outfit, was seen halting at the edge of one of the numerous streams met in the day's run, trying to replace a broken valve. Then over a waterlogged road to Klapmuts, and hence the route led over the main road to the Cape. Many were the heroes met with who had fallen by the roadside. Results:

		Marks lost.
1.	Rev. S. B. Priston (3½ Bradbury) (holder)	20
2.	J. C. F. Myburgh (7 F.N.) ...	30
3.	E. W. Watts (6 Enfield sc.) ...	41
4.	E. G. Alexander (6 Bat sc.) ...	180

The Continental Cup now becomes the winner's absolute property.



The Rev. S. B. Priston (winner) on his 3½ h.p. horizontal Bradbury. This rider was the only one successfully to cross the river without assistance thanks to a protected engine and a high magneto position. The deeper part has still to be negotiated.

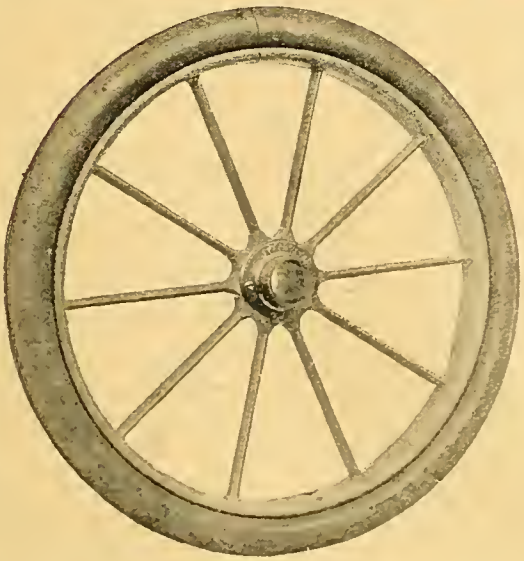


The stream near Drakenstein. F. Meredith (6 h.p. Enfield and sidecar) experiencing trouble with a valve.

The Starley Tubular Wheel.

An Artillery Wheel for Motor Cycles, Easy to Clean and Light in Weight.

THERE is no doubt that the ordinary wire wheel is very troublesome to clean, for the spokes are numerous and it is difficult to get at the hub; many motor cyclists will, therefore, be glad to hear of a wheel which very closely approaches the wire wheel in the matter of weight, and possesses none of the disadvantages just mentioned. The Starley wheel which we illustrate is the invention of Mr. William Starley and is of very interesting construction. Ten lugs are riveted to the rim, the latter being made as usual; over these lugs are placed the spokes, which in the centre fit into malleable wedge-shaped pieces like the ends of the spokes of an artillery wheel. For convenience of fitting, a certain amount of play is allowed between these pieces, and, when the spokes are in place, corrugated steel wedges are forced between these pieces from the inside, thus the whole is held firmly together. A groove is then turned in the centre and a liner inserted, which is spun into the groove. Next, a hub is put through the centre and bolted up with a flange on each side, the bolts going through alternate spokes. The spokes are formed from steel tube rolled to an oval section, but running to a point on each side. This gives great lateral stiffness, but at the same time the wheel has a certain amount of spring. The parts are all made of steel and polished before assembling, thus very little finishing off is needed, and, as no wood is used in the construction, the whole can be stove enamelled. Wheels made in this way are absolutely true and very strong. The inside of the rim is unusually smooth owing to absence of spoke heads, the riveted lugs before mentioned being flush with the inside of the rim. The weight of the wheel is very little more than the ordinary type, being 9 lb. complete. The wheel is made by the Jointless Rim Co., Long Acre, Birmingham, and is at present being tried by certain well-known firms with a view to adoption in 1915.



The Starley tubular wheel for motor cycles and sidecars.

The Future of the Artillery Wheel.

It will be exceedingly interesting to watch the development of what may be termed artillery wheels for motor cycles. Since the advent of steel wheels on the Clynos in the Scottish Trials there has been a considerable amount of spade work done in this direction.

There are also many possibilities about the disc wheel which was designed many years ago for use on pedal racing bicycles, one of the objects being the elimination of the air resistance of a large number of fast revolving spokes, the skin friction of the polished disc being almost negligible.

SCENES ON THE SEVERE TRIAL HELD BY THE CAPE PENINSULA M.C.C. FOR THE CONTINENTAL CUP.

A Magneto Trouble with Two-stroke Engines.

I rejoice to see that two or three British firms are seriously embarking on the manufacture of magnetos; and I hope that when they get under way they will pay careful attention to a small detail which the Germans have yet not solved. The carbon brushes which pick up the high-tension current from the collector ring are apt to become non-conductive at their tips when the magneto is run at crankshaft speed (as on a two-stroke engine). The tip of the brush becomes glazed over with a kind of hard scale which appears to be a non-conductor, and the engine may behave very funnily until the brush is renewed or its tip filed down a trifle. I understand the trouble can be reduced by using a lighter spring behind the brush, as less pressure is required for good contact at the high speed attained by the armature in machines of this design.

Curious!

In common with many other people, I should like to know on what principles the responsible authorities made their selection from the first plethora of motor cyclist volunteers. A number of comparatively raw and inexperienced "blinding nuts" (as one disgruntled and rejected rider put it) were rapidly given coveted berths, whilst several of our very finest and most experienced men were ruthlessly refused work. One of the men whom every rider in the kingdom would naturally nominate as one of the best qualified for the job was cold-shouldered; some of those accepted are reckless drivers and indifferent mechanics, besides being apparently devoid of map-reading or military experience. The War Office has behaved so magnificently in most respects that this wee grumble seems ungrateful; but one rather suspects that genuine motor cycling authorities were barely consulted in this business, and one hopes that if more motor cyclists are required, the committees of the A.C.U., M.C.C., B.M.C.R.C., and two or three of the bigger provincial clubs will be interviewed on the matter. Balaclava was due to a despatch rider's blunder; I should not like to think that the fate of a brigade in the present war might depend on one or two motor cyclists of my acquaintance; however, they will soon be classified when they get to work.

Sidecar Mudguards.

It may have been a pure coincidence that on a short afternoon run this week I passed three sidecar outfits all minus the near side mudguard. Contrariwise, it may be that these stays are not made strong enough for the duties they sustain. There is no more irritating trouble of a petty kind, for it is difficult to fake a broken stay, and the unlucky owner must usually detach the remaining stays, and compel his fair passenger to nurse the filthy, no-shape fitting until he reaches a repair shop. I do not remember seeing a sidecar with a wide flat mudguard fitted to the chair instead of to the chassis, the explanation being that there is usually too much play on the springs; why should sidecar springs require more rise and fall than car springs? However, the makers' business is either to fit a strong stay on the unsprung chassis, or to spring the chassis; or to fit the guard on the chair, and make it wider.

Rear Springing.

I have long held that the problem of rear springing is the most vital of all that face the motor cycle designer, but I have made few references to the matter lately, because the trade seemed cynically impervious on this point. I return to it at last like a giant refreshed. I happen to have ridden a P.V. spring frame and a rear-sprung Indian within one and the same week, and the relief to my spine was enormous. Readers will guess from the length of my connection with *The Motor Cycle* that I am no longer in my teens, and the older one gets the more heartfelt is the muttered "Ouch!" which is our normal benediction of a level-crossing or a particularly antediluvian pothole. I admit the worst that can be urged against existing rear springs; they are heavy, they may not appear beautiful, and they add to the cost of a machine. But the extra insulation they afford is most desirable. I live in a district of average roads, and once a week I ride five miles out and home to a golf club. Thrice in that distance I stand on my footrests to dodge the bang of a level-crossing, a half-filled drain trench, and a series of potholes where a foundationless road crosses a bridge over water meadows. For a whole mile of the distance my eye is glued to the road surface, for I know that the manholes and drain lids protrude from one to three inches out of the worn macadam. Yet over the remainder of the journey I am always unduly conscious of the fact that I have a spine, and that my spine is constructed of short pieces like a speedometer driving shaft; are not the rough road and the rigid frame playing skittles with my vertebræ every inch of the way?

Yet I am no weakling. I think nothing of 300 miles in the day, or of trebling the speed limit on a deserted road. There are millions of potential riders far more sensitive than myself. Does the trade realise what this means? It means that if one of the fiercely competing 500 c.c. firms brought out an efficiently rearsprung machine I should ride it to the exclusion of every other make; and that thousands of similar individuals would be equally discerning and resolute. Does this tempt nobody?

THE TWIN ARIEL ON THE ROAD.

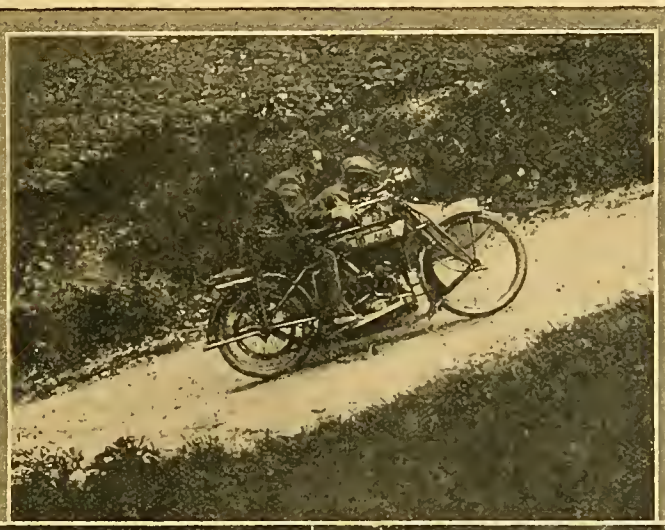
Freak Hills Successfully Scaled with a Sidecar.

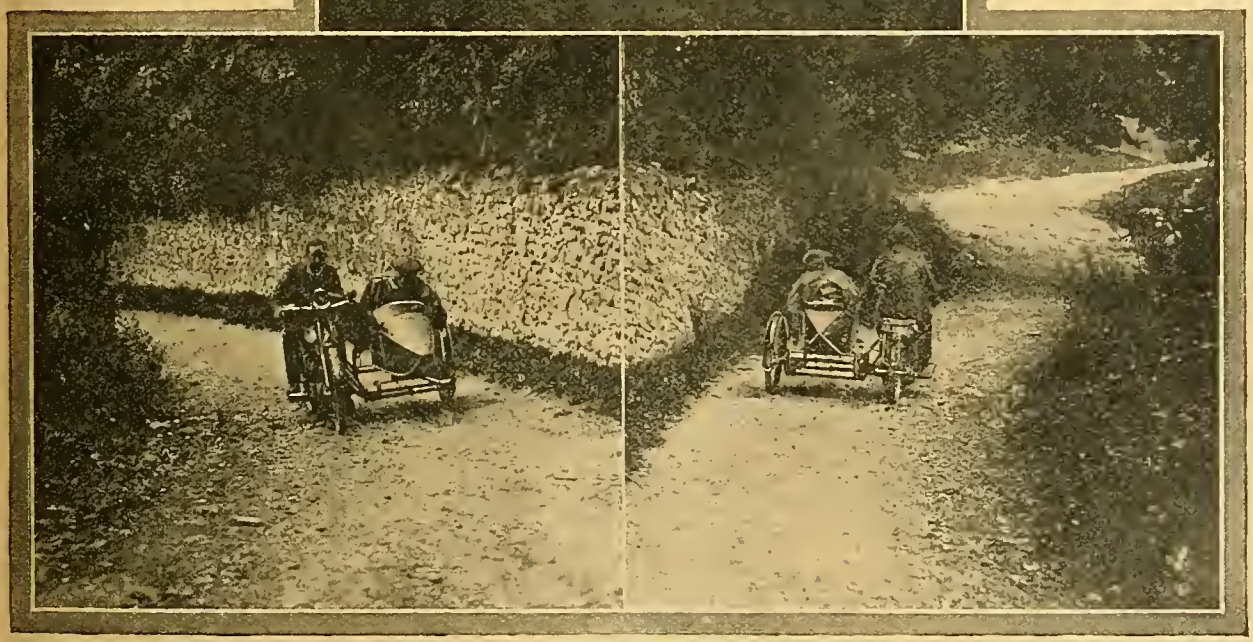
WITH recollections of our last successful trip to Bwlch-y-Groes with F. C. North on a 3½ h.p. Ariel and sidecar, we determined to try and beat the 5-6 h.p. twin on some freak gradients. Accordingly we set out to attempt the Nailsworth Ladder under full touring conditions. The machine was a standard one with the usual gear ratios of 4½, 8, and 14 to 1, and we were told that the engine had received no attention for a very long time.

We set off from Coventry at a smart pace, intending to make our first attempt on the Ladder before lunch. The engine started easily and purred away steadily through Warwick, Stratford-on-Avon, and Broadway, and never a fault or misfire appeared. At Cheltenham it was considered advisable to replenish the tank, and calling at Mr. T. West's garage we obtained petrol at normal prices. After this we changed places with North, who had previously been driving. The engine is particularly easy to handle, and is practically vibrationless, while the gears are silent and change very easily and quietly. Rain began to fall in a few heavy drops, and after passing through Stroud the roads were wet and greasy. However, on reaching the hill it was found to be protected by the trees and quite dry, though the surface in places was very bad.

Up Nailsworth Ladder at the First Attempt.

The first pitch of all is probably the steepest, and on it the large stones stick out of the bed of the road in a terrifying manner and we began to wonder if the steel-studded rear tyre would stand up and grip the surface. Although the driver had never before attempted the hill the very first attempt was successful, and on a second attempt for photographic purposes the machine was intentionally stopped and restarted just below the steep gradient at the top of the climb. The engine pulled superbly, and though the back wheel spun without moving the machine, the passenger quickly moved from the sidecar to the carrier and the machine went up quite comfortably and easily. This is one of the finest performances we have seen for an engine of

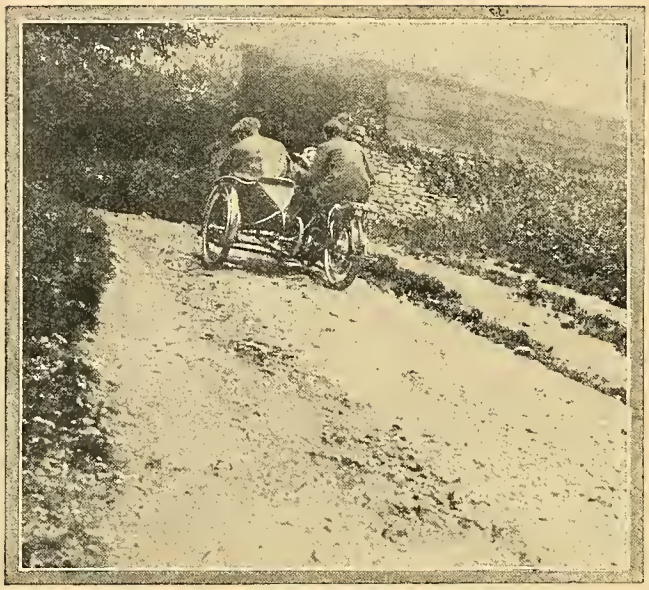




THE TWIN ARIEL ON NAILSWORTH LADDER.

(1) In the middle of the Ladder A stop and restart was accomplished at this point.
(2) Another view half-way up the Ladder.
(3) Approaching the last steep pitch. The surface gets gradually worse towards the top.

The Twin Ariel on the Road.—



On the steepest part of The Ladder. Note the rough state of the surface.

670 c.c., and we were thoroughly satisfied with the pulling powers of the machine. It may be added that no sign of belt or clutch slip was observable, in spite of a fairly slack belt and a well loaded and fully equipped machine. During lunch the rain started in earnest and we prepared for a wet ride home.

Up Birdlip on Middle Gear.

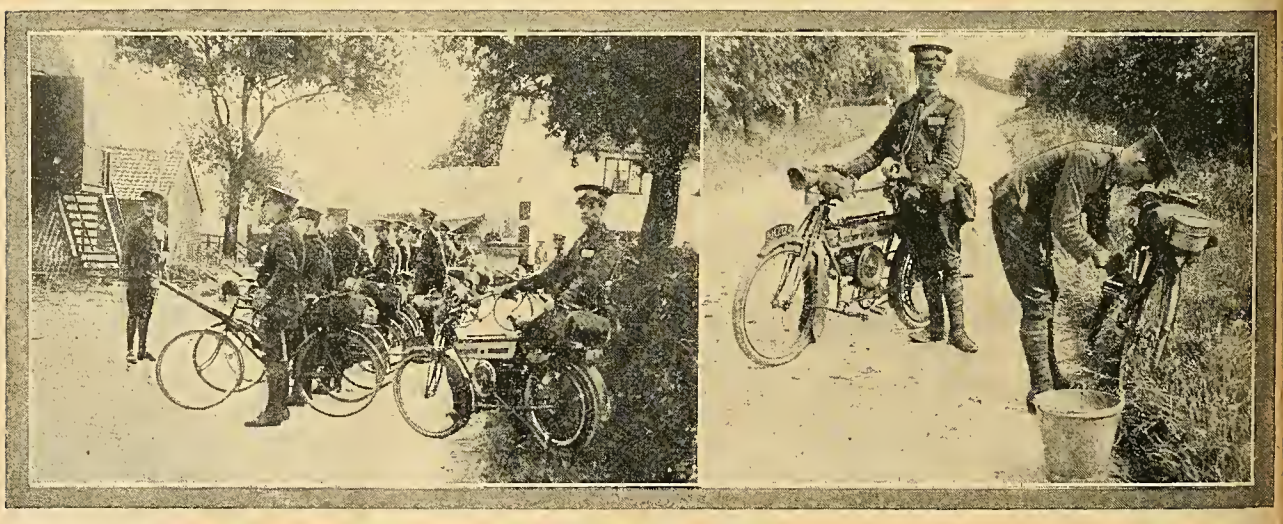
However, at the foot of Birdlip the rain eased off and we decided to reach Cheltenham *via* the well-known hill, though, of course, it is child's play in comparison with the Ladder. So easily did the twin take the long gradient that the low gear was never used; in fact, the engine was turning round comfortably on middle all the way up. After passing Cheltenham, North expressed a desire to have a look at Post Office Hill, and in spite of our warning that the surface on the steep part was horrible the attempt was successfully made with a hot engine. The loose stones and cross gullies are very bad, but the Ariel travelled steadily up with never a falter.

The rain had now stopped entirely, and we enjoyed a pleasant run home. Among the many excellent features of the machine is the splendid way in which it will maintain a high average speed without a sign of overheating, besides which it is extremely quiet, and when driving in traffic the engine is almost inaudible.

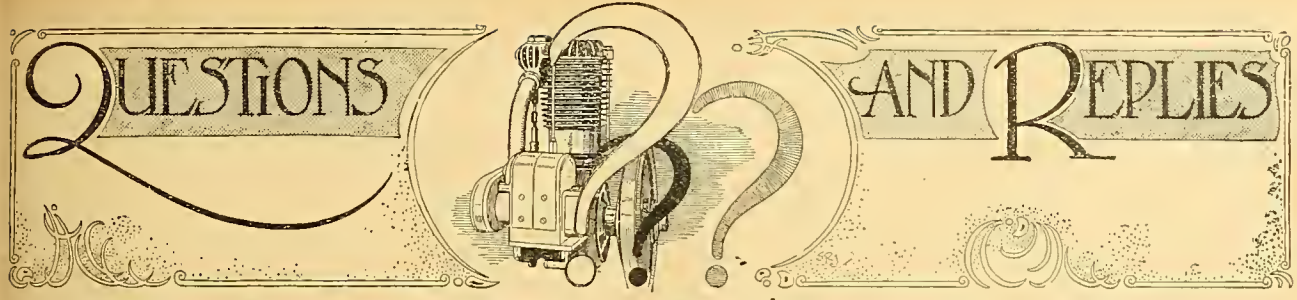
Two-strokes and Paraffin.

THE experiments with paraffin which we have been carrying out on a two-stroke machine have been progressing satisfactorily. The consumption of fuel is rather better than with petrol, and several interesting features have become apparent. Firstly the carbon deposit is not noticeably greater, secondly the exhaust port does not become choked anything like so quickly, owing to the softer nature of the deposit, and, thirdly, the deposit on the cylinder head and piston is very much easier to remove.

So far only one serious drawback has been encountered, and that is the difficulty of obtaining a plug which will withstand the increased heat and the paraffin vapour. Sooting up has not been experienced since the oil supply has been slightly reduced, but the insulation seems to break down under the heat and the effects of paraffin. The plugs give out quite suddenly, usually when travelling fairly fast, and when removed from the cylinder appear in good order. After cooling down they may be used again until the same symptoms repeat themselves. Plugs with porcelain insulation have so far stood the tests most satisfactorily. The trouble may be partly due to the rather high compression used on the engine, and experiments are now going forward with the compression slightly lowered, though so far our road experience since the alteration has been too short for definite results to be obtained.



One of the cyclist sections which are doing useful work on the East Coast. They are attended by a motor cyclist despatch rider who stays behind in case of tyre trouble to hurry his comrades on.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Automatic Magneto Timing.

Why not fit small governors on the magneto revolving with the armature, to advance and retard the spark, instead of having to move a lever frequently, as one needs to do on many machines? There could be a movable stop at full advance and retard for adjustment. Is there any objection to such a plan?—M.S.

Your idea would certainly be of advantage to a certain degree, but it is questionable whether it is really worth the extra complication. Personally we do not think that it would be so. As a matter of fact, a certain firm of magneto makers have already tried such a device, but gave it up as not being sufficiently certain in its action.

Endorsements on Driving Licence.

A few weeks ago I was convicted at a country police court for having, as they stated, an inefficient silencer, and was fined and had my driving licence endorsed to that effect. The information I should like is as follows: Are the police empowered to endorse a licence for such a technical offence, seeing that the magistrates did not state that my licence was to be endorsed? This was done by one of the police. Will this endorsement have to be made on any future driving licence I may take out? Are there any means by which I can have the endorsement taken off? What is the effect of such an endorsement upon my licence, and am I restricted in any way by having such an endorsement? Is a driving licence suspended or cancelled when a certain number of endorsements have been made thereon? —G.W.H

The police were quite within their rights in endorsing your licence, and the endorsement will be copied out on every licence you take out. There are no means of getting the endorsement cancelled unless you prove yourself to be not guilty in an appeal. The effect of such an endorsement is not really very serious. Although your licence is not endorsed for the first and second offences against the speed limit the offences are recorded against you in the police books. A driving licence is suspended only if the number of endorsements is excessive and the behaviour of the driver has been really bad, and, in the opinion of the magistrates' court, such a driver is dangerous to the public.

Formula for Speed Trials.

Some time ago I was concerned in holding a speed trial on the flat. The formula used was $\frac{\text{miles per hour}}{\text{c.c.}}$ = figure of merit, highest to win. Hitherto, we have found this formula very satisfactory. This year, however, one of the competitors rode a two-stroke Connaught, with the result that the other competitors were left far behind. The figures for the first two men in the sidecar class are as follow: First man, $\frac{21 \text{ m.p.h.}}{293} = 706$; second man, $\frac{32 \text{ m.p.h.}}{550} = 581$. Would you please let me have a formula that will make things more even for two and four-stroke machines, or let me know a fair handicap for two-stroke motors? Next year we shall have several in the club. The event was for speed on the flat from a flying start.—G.A.D.

Your formula is faulty, for the reason that it assumes that an increase in capacity (or horse-power) means a proportional increase in speed, but this is not the case. For instance, a 500 c.c. machine, well tuned, is capable of 70 m.p.h. According to your formula, a 1,000 c.c. engine would have to do over 140 m.p.h. to win, whereas the highest recorded speed in this country is well under 100 m.p.h. The formula we recommend for hill-climbing is $\frac{C \times t^2}{W}$ as is now well known (C = capacity, t = time, and W = weight of machine and rider). In the case of speed on the level the weight can be ignored, and the formula will then be $C \times t^2$, and the smallest figure will win. Assuming the distance to be 1 km., this gives your first man 330 and the second 270, and the places are thus changed. The old handicap on two-stroke engines was to multiply the capacity by 1.25, or if water-cooled by 1.32, but this was removed by the A.C.U. some few years ago.

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints, half-plate, 1/6 post free; mounted, 1/9 post free. This refers to photographs taken by "THE MOTOR CYCLE" operators.

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

Cylinder Insecurely Held Down.

I wonder if any of your readers have had a similar experience to mine? Recently I had occasion to take the cylinder down, and found a piston ring was broken, so fitted a new one. In screwing the cylinder down again I found the bolts were turning with the nuts, but as the joint seemed fairly tight I fitted the carburetter, but upon starting the engine the cylinder was blown completely away from the crank case, and now I find the threads have stripped in the aluminium, making it impossible to bolt down. I should be obliged if you can suggest what will have to be done —A.F.D.

The cause of the burst in the cylinder is probably due to some of the holding down bolts being screwed tighter than others, thereby badly straining the casting. Under the circumstances, the only thing to do is to fit fresh bolts and a new cylinder, and see that the bolts are firmly and evenly fixed in the aluminium. It will probably be necessary to fit bolts of slightly larger diameter, so as to get a good grip of the crank case.

Numbers not Illuminated.

When out riding at night lately I was stopped and my name and number taken. The speed was normal, and I find that there were scores stopped at this particular spot, a motor car being drawn across the road. Nothing whatever was said either about speed or illuminating of number plate, and now I have been summoned, the charge being non-illumination of the front number plate. I carry a good lamp in front, which shines on the plate and front wheel, and the plate is standard type, upright, with the number on both sides. It is absolutely impossible for anyone to read a number while travelling with lamp lit, owing to bouncing of the front wheel.—G.E.D.

We are afraid it is no excuse for you to say that it is impossible for anyone to read the number when the lamp is alight. The law says that the number must be illuminated, and if it is not illuminated in a manner that may be read you are liable to prosecution. If you belong to the Auto Cycle Union or Automobile Association and Motor Union, you can get defended free of charge on a summons of this kind.

Blow-back on a Twin-cylinder.

I am the owner of a 1912 2¾ h.p. which, until recently, ran quite satisfactorily, but now it has developed a very bad blow-back, *i.e.*, quite a heavy stream of petrol is blown back through the air inlet. The carburetter is a lightweight Amac. The carburetter does not flood, because if the machine is standing no petrol leaks out, and to make sure I have lowered the level in the float chamber. If you can help me to make the engine run normally I should be greatly obliged.—L.R.

In all probability the trouble is due to the inlet valves closing imperfectly. As a matter of fact, there is nearly always a little blow-back through all types of carburetters, and the fitting of a pipe about four inches long to the air inlet would minimise loss of petrol very considerably in this direction. There is evidently nothing the matter with the carburetter itself on your machine, but you must examine carefully if there is proper clearance between the valve stems and the tappets when the valves are closed. This clearance should be about the thickness of a visiting card.

Persistent Overheating.

I have a 3½ h.p. 1908 motor cycle, single-cylinder, Bosch magneto, B and B. carburetter, standard jet and choke. The trouble I experience is overheating, which causes poor pulling on hills when too hot, additional or spontaneous firing, causing a sort of back stagger to the machine and burning of the exhaust valve every 200 miles or so. The top of the exhaust valve casing glows red after a stiff pull up hill. The magneto timing has recently been set correctly, and since this was done the heating is slightly less, but the valve burns out quicker. The engine has been racing more or less due to a poor belt, but I do not think this will account for the trouble. Could you throw any light upon this trouble?—R.A.S.

We think your machine is suffering from want of a good overhaul. The exhaust valve spring is probably weak, and you may be using valves which are not of the very best quality. It also sounds as though you have too large a jet, which causes overheating and extra wear on the valves. Of course, if the engine has been racing continuously it must have got very hot, and this alone might account for the trouble.

Providing Increased Comfort.

I have a 2 h.p. lightweight and suffer badly from jolting, even over quite moderate London roads. To remedy this, would you advise me to put a 2in. or 2¼in. rim to back wheel instead of the present 1¾in., and would it be well to alter the belt ⅝in. to ¾in. in consequence? The magneto timing is fixed, but I find the engine runs cooler by advancing it slightly, as on higher-powered machines when ordinary speed is reached. Would there be any danger in my putting on a control, and what range would you suggest?—H.N.W.C.

We think that if you fitted 2¼in. rims and tyres both to the front and rear the smoothness in running would be greatly enhanced. We do not think that one wheel alone would be sufficient to make a marked difference. It would certainly be better to run a ⅞in. belt than a ⅝in., whether you alter the size of the tyres or not, and a variable ignition is a great asset to a machine. If you could alter yours you would probably find a marked difference in the running. We should advise you to give a movement of about half an inch on the contact breaker cam casing and time the engine as follows: When the piston is on top dead centre the contacts should be just about to break and the ignition lever should be in the full retard position.

Gear Ratios and Pulley Adjustment.

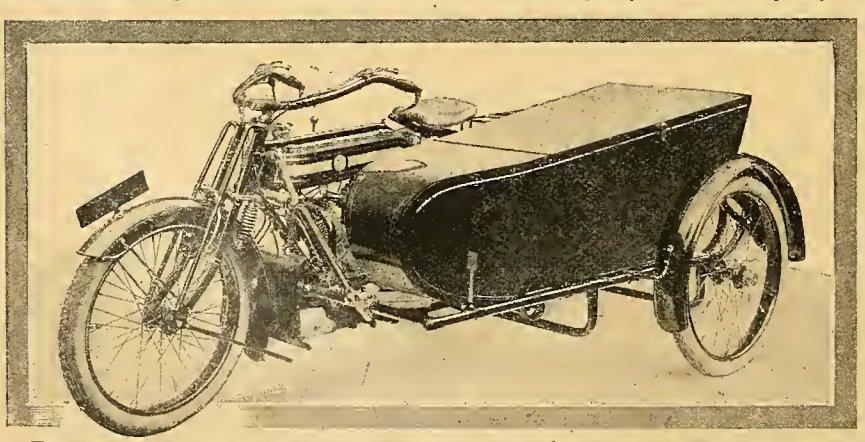
I am thinking of having an adjustable pulley made to my own design, expanding on a worm on the shaft. I want to get a 6½in. or 7in. pulley. What size belt rim should I require to get a 3½ or 4 to 1 top gear, and what is the lowest gear I could get when the belt is at the bottom of the pulley (2½in. diameter)? I intend to operate the pulley by means of a ball push piece, and I shall possibly have a jockey pulley worked from the push piece lever to come in contact with the belt only when the latter is getting well down in the pulley.—H.K.

You cannot obtain a 4 to 1 top gear with a 7in. front pulley unless this pulley is geared down from the engine. If you had a 7in. pulley you would require a 28in. rear belt rim, which is obviously impossible. In addition, you will find that it is not possible to get a pulley of 7in. diameter on top and 2½in. diameter on bottom unless the flanges are made to interlock in some way as the angle of the belt prevents this being carried out. The variation of 3in. is probably as much as can be obtained in the ordinary way, that is to say, if you have a 7in. pulley with the flanges contracted; when expanded you will get a 4in. pulley. A rough method of checking your gear ratio is to divide the diameter of the front pulley into that of the rear. This is not absolutely correct, but gives a very fair idea in each instance.

Oil Pressures on Pistons.

Can you tell me if there is a piston on the market to stand a continuous pressure from 800 to 1,000 lb. per square inch (oil pressure) without any leak and running at 1,500 maximum? If I can find a piston to stand the above pressure and speed without any loss I can assure you that the article for which it is intended will be the most novel thing you have heard of in the motor trade for many months. The idea is not only theory, as I have made one and tried it on my motor cycle, but cannot get a piston to stand up for long without a leak. I have a provisional protection for this idea, which will run out in about another month, and I wish to know if it is possible to get an extension till the end of the war, as the countries in which one would want to take out patents are in such a disturbed state.—N.F.S.

We are afraid that no motor cycle piston will stand a constant oil pressure of 1,000 lb. per square inch without a slight leakage. We would advise you to apply to manufacturers of steam pistons, as steam rings and piston design would be more suitable for your work, as far as we can understand, although you do not give us sufficient details to state definitely what type of piston you require. We have heard of no alterations in the provisional patent forms, and think it is extremely doubtful that you can obtain an extension without completing your patent. Still, you had better apply to a patent agent, who will be able to advise you.



The 6 h.p. Rex-Jap sidecar specially arranged for use by commercial travellers. The sidecar body will accommodate personal effects and samples

EXPERIENCES WANTED.

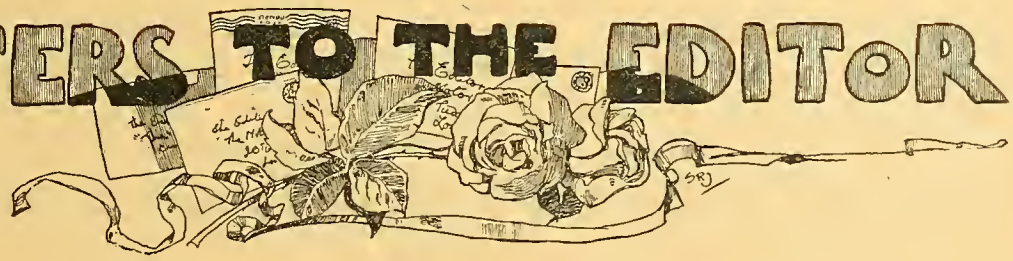
Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"B.W.G." (Dublin).—Lincoln Elk. Reliability and durability, hill-climbing powers with sidecar, and wear of tyres.

"F.W.P." (York).—3½ h.p. Wolf. Reliability, durabilty, and consumption, whether chain drive is harsh, or chain-cum-belt preferable. Also if a Binks or B. and B. carburetter gives best results.

"J.W.H." (Sydney, N.S.W.)—3½ h.p. Douglas with kick starter; solo and with sidecar. Efficiency of mechanical lubrication, oil and petrol consumption. Brampton bi-flex spring forks. Binks three-jet carburetter.

LETTERS TO THE EDITOR



The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Notched Ring Unions.

Sir,—I note that "Ixion" finds difficulty in moving notched ring unions. I think that, if he gets a proper C spanner instead of the rubbishy sheet metal contraption usually supplied, he will not find any more difficulty than he would with an ordinary hexagon nut.

The C spanner should be forged about $\frac{3}{8}$in. to $\frac{1}{2}$in. thick, according to the size of the nut for which it is made.

ARTIFEX.

The Double Purpose Machine.

Sir,—I have seen a good deal of discussion lately as to the ideal "double purpose machine," and I would venture to give my views on the subject. The majority seem to be in favour of the 3½ h.p. machine, but I think nothing under 1,000 c.c. is any use for sidecar work. On taking off the sidecar this makes an ideal solo mount, owing to the fact that one has perfect acceleration and hill-climbing power, combined with all the speed required on the level. Although petrol, oil, and tyre expenses are slightly greater than on a lower-powered machine, this is compensated by fewer stops and troubles on the road caused by overheating. The comfort of a long run on a big twin cannot be compared with the vibration of a 3½ h.p. single.

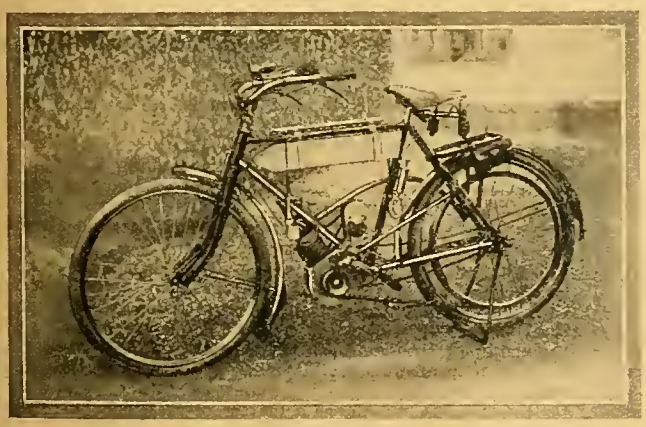
10,000 MILES A YEAR.

A Converted Minerva.

Sir,—I have been interested of late in the illustrations in your valuable paper, *The Motor Cycle*, of the different types of lightweight motor cycles both old and new, and thought it might interest some of your readers to know what can be done with some of the old type motors.

I purchased a Minerva and converted it into an up-to-date lightweight; the frame has been cut down from twenty-four to twenty-one inches; the wheels are 26in. × 1¾in., and the tank is of copper, holding two gallons petrol and one pint oil; a spring seat pillar is fitted, also spring fork ends and magneto ignition. The weight of the motor cycle is 65 lb.; it runs splendidly, and is most comfortable to ride and easy to control. All parts are accessible for repairs.

C. R. BECKETT.



C. R. Beckett's converted Min rva. (See letter.)

The Effect of the War on Patents.

Sir,—My Parisian agent, writing on August 19th, informs me that by a decree given on the 16th the French Government, with commendable thoughtfulness for inventors, will allow applications for patents to be made without payment of the usual application fee of 100 francs. Such payment is only to be made after the war and on a date to be subsequently fixed.

The decree applies to British applicants, and, presumably, to all others except subjects of those countries at war with France.

WILLIAM H. TAYLOR.

Sir,—In connection with the above, considerable misunderstanding exists as to the steps which are being taken to deal with the patents held in this country by Germans and Austrians. Special Patent Rules have been drawn up dealing with this point, and printed copies will shortly be available. Meanwhile, it may be of interest to know that such patents do not *ipso facto* become void, but that in each case an application must be made to the Board of Trade, accompanied by a £2 stamp, asking for the patent or licence to be suspended. No special period of suspension is mentioned in the Rules, but the applicant must satisfy the Board of Trade that the owner of the patent is a German or Austrian subject, that he personally intends to manufacture or have manufactured the patented article, and that suspension of the patent is in the interests of trade.

The same Patent Rules also deal with a case where a British patentee is unable, through active service, etc., to give proper attention to patent matters. In such a case special delays are granted.

ERIC W. WALFORD.

Suggestion to Riders of Hendee Special Motor Cycles.

Sir,—On a recent Sunday when I went to get my Hendee Special sidecar outfit from the garage I found, to my disgust, that I had left the contact plugs in the switch block under the saddle from the previous day. It immediately occurred to me that it would be useless to try to start the engine with the weak current which was left in the batteries, so I tested the horn to see if there were any current at all, and found there was just enough left in to give a faint sound. I then started the engine by pushing off and rode about thirty miles at an average speed of twenty miles an hour, using the horn as little as possible, but was very pleased to find that the further I went the louder the horn sounded. At the end of thirty miles I tested the batteries with the voltmeter, which I always carry, and found that they had recovered fully up to their standard, and the electric starter worked perfectly.

My advice, therefore, to all riders of Hendee Specials is, that if through an oversight you leave the contact plugs in overnight, do not attempt to start the engine with the electric starter; drive the machine from twenty to thirty miles, using the horn as little as possible, and the chances are that the batteries will, in that distance, become fully re-charged.

W. H. WELLS

(Manager, Hendee Mfg. Co.).

A Universal Repairing House.

Sir,—Will some few enterprising capitalists start and equip a central repairing house, which shall specialise on prompt and efficient repairs to motors, motor cycles, and ordinary cycles?

It has been my misfortune to have to send to a big motor cycle firm for a pair of new forks. Between two

and three weeks have now passed since the order was despatched, and no news is to hand beyond the formal acknowledgment.

A well-equipped central repairing house, which would carry out ordinary orders with ordinary business promptitude and courtesy, would, I am convinced, rake in profits with both hands, and its happy clients would be its own advertisement. My motor cycle comes from a firm with a big name, but I am not so wedded to its particular virtues that those of other motor cycles are hidden from me. Delays are dangerous—to second orders, and when next I get a new machine I shall sample another make.

W.V.C.

A Freak Climb.

Sir,—Might I ask "W.G.," whilst in the mood, and also the Rochdale M.C.C., to have a look at "The Buttress," Hebden Bridge?

W.L.

Two Lady Motor Cyclists Missing.

Sir,—Can you aid us with any information concerning the whereabouts of Mrs. Rachael Foster Avery and her daughter, Miss Julia Avery, who left this country to visit the dairying centres of Great Britain and the Continent? Mr. H. H. McDaniel, of Madison, Wisconsin, U.S.A., received a postcard saying that the Harley-Davidson motor cycle and sidecar which they were using in their travels had been confiscated for war purposes, but the post mark on the card was so obliterated that it was impossible to tell where it had been posted.

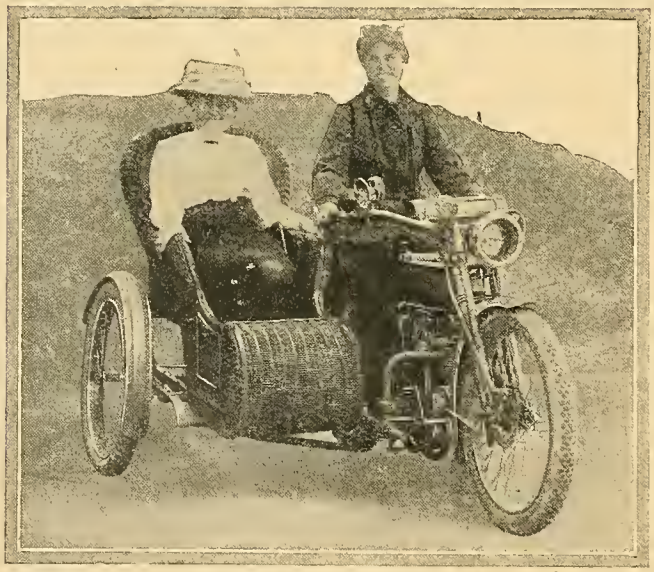
Miss Avery and her mother had planned to be at Ostend, Belgium, the early part of August, and it is assumed that the commandeering was done by the Belgian Government, but the information on the subject is not definite, and it is possible that they were deprived of their means of transportation either by the French or German Government, as they contemplated travelling to Ostend from Paris, *viâ* Alsace-Lorraine.

Both Miss Avery and her mother are students in the agricultural department at the University of Wisconsin. They planned their trip to arrive in Brittany for the day of "The Pardons," a Catholic holy day, at which time large numbers of cows are blessed and a certain number given to the church. Following that, they planned to inspect the large dairy farms in the Channel Islands, the home of the Jersey and the Guernsey, and then to travel through France, Belgium, and Holland to study the Holstein breed and the Dutch belted cattle.

Mrs. Avery and her daughter have travelled extensively in Great Britain and on the Continent in previous years. Their trip this year was the first one in which they used a motor cycle, and we trust that everything possible will be done by motor cyclists to aid them in returning home safely, after the commandeering of their motor cycle and sidecar.

We are sending, under separate cover, a photograph of Miss Avery and her mother and the sidecar purchased for dairy inspection and destined to serve in the war. If any of your readers have any information concerning Mrs. Avery and her daughter we trust that it will be communicated to us promptly to relieve the anxiety of their many friends.

HARLEY-DAVIDSON MOTOR CO.



HAVE YOU MET THEM?

Mrs. Rachel Foster Avery and her daughter, Miss Julia Avery, of Philadelphia, who planned to spend the summer studying European dairy methods, to supplement their studies at the University of Wisconsin, and whose Harley-Davidson sidecar outfit was confiscated for war purposes Their friends are anxious to hear news of them

A Private Motor Bicycle Commandeered.

Sir,—In a recent issue of *The Motor Cycle* I note with interest your photograph of Corporal Guy Drew and his 3½ Premier. I must tell you he is now riding a 1914 T.T. Douglas, which he most kindly commandeered from myself. I learn that something went wrong with his original mount, and there was no time to have this put right. I happened to be the unlucky man nearest with a new machine.

ALBERT MOSS.

Despatch Riders.

Sir,—Below is an extract from *The Evening News* of August 25th: "A despatch motor cyclist, on Government business, broke down in Edgware Road. Unfortunately, he knew nothing about his machine. A lady motorist of the Women's Emergency Corps stopped and made good the defect in the machine."

May I ask why such a man as this should be given preference to over 13,000 motor cyclists who have volunteered for service, among whom I am personally acquainted with two or three expert riders, having also volunteered myself and awaiting instructions? I do not claim to know everything, but I do not think I should be stranded in such a predicament.

F 7556.

The A.C.U. and Competitions.

Sir,—We have to-day received from the A.C.U. a circular letter urging that motor cycle competitions should be carried on. We think it is necessary that a paper with a circulation such as yours should take this matter up very strongly. We have replied to the effect that as most of the competitors in A.C.U. competitions are single men, the A.C.U. would be assisting the country in a much more loyal manner if they urged their members who are single men to take up arms on behalf of their country, which would be much more commendable than riding about through the country on a motor bicycle for the purpose of gaining marks with a white badge round their arms, which we think at these dreadful times would be utterly absurd. We cannot imagine the Belgians, French, or Russians having motor cycle competitions at this time.

MOTOSACOCHE, LTD.
August 27th. O. DE LISSA, Managing Director.

Possible Scarcity of Motor Tyres.

Sir,—Referring to a statement which is being industriously circulated relating to the "Possibility of a Scarcity of Tyres," we, as the largest tyre manufacturers in the Empire, are in a position to say positively that there is no danger whatever of a shortage in the supply of tyres. We have already stated that we can instantly meet any demand likely to be made upon us, and we have done this after taking into full consideration the situation created by the stoppage of supplies from Continental European sources.

We have also announced that there has been no alteration of our prices, and no stoppage of credit.

We should feel obliged if you would publish the above facts so as to reassure the public. We think it will be agreed that the suggestion which has also been made in this connection, that owners of motor vehicles and cycles should curtail the use of their vehicles, is an untimely and mischievous one, tending to promote unemployment and to injure the rubber, motor, cycle, and cotton industries by reducing the demand for these goods, which, as a matter of fact, can be produced in practically unlimited quantities in this country by British workpeople.

THE DUNLOP RUBBER CO., LTD

Official distinction.

Convincing evidence of the value of the many and exclusive features identified with

CLYNO Motor Cycles

is furnished by the fact that the CLYNO COMBINATION is, so far as we can ascertain, the only combination expressly designed for Sidecar use which has been

ordered by H.M. WAR OFFICE

And such evidence should influence your choice — let us send you details and copy of our latest list — "1914."

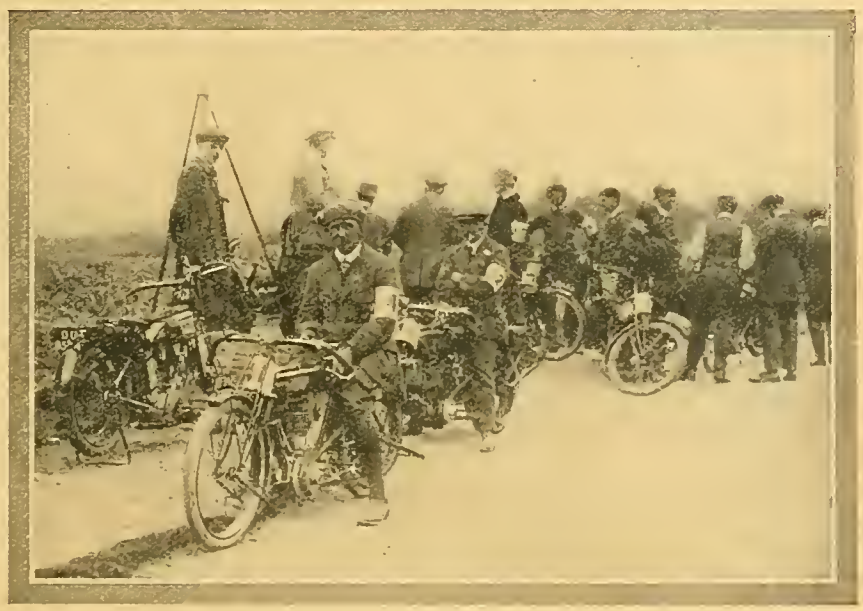
HIGH SPEEDS AT STYLE COP.

Results and Impressions of the Coventry and Warwickshire M.C. Ninth Annual Hill-climb.

THERE was a goodly crowd of spectators at the ninth annual hill-climb of the Coventry and Warwickshire Motor Club held at Style Cop, near Rugeley, last Saturday. The Coventry Club's hill-climb has come to be regarded as one of the classic events of the year, as entries are always numerous and the competition keen.

It may not be known that the Highway Board of the locality charge £5 for the use of Style Cop as a hill-climbing venue, the Wolverhampton, Sutton Coldfield, and Coventry clubs having paid this amount. There were 100 entries in the Coventry climb, so that 1s. per run should pay the council splendidly. However, the Coventry Committee were anxious to use a "safe" hill, and there is no doubt that Style Cop is one of the most desirable venues in the country from a speed hill-climbing point of view, being comparatively straight, of good surface, and with a high bank at the roadside near the finish which forms a natural grandstand for the spectators. There was a good sprinkling of the trade among the big concourse of spectators, who had arrived at the hill on all descriptions of motor vehicles.

The organising club's local headquarters were at the Shrewsbury Arms Hotel, where here numbers were issued.



Scene at the scales. The riders in the foreground are: H. Petty (3½ h.p. Norton)—who headed two "general" classes, and Ernest Smith (3½ h.p. Regal-Precision.)

The Ever Useful Boy Scout.

Prompt at 1.30 p.m. competitors, officials, and timekeepers were in their places on the hill, a long line of Boy Scouts signalling along the course by means of red and white flags. It only remained for the hill to be cleared of non-competing vehicles, and a start was made with Class 2 (Class 1 for Auto Wheels receiving but one entry). In this event the four long-stroke Levis machines of 60×70 mm. stood out prominently, and varied very little in speed. Their Enfield two-speed gears were used to great advantage in starting, and the drone of their engines was good to listen to. Even in Class 3, when competing against engines up to 350 c.c., they were just as prominent. In this event an entirely new design Enfield made its debut. We describe and illustrate this machine on another page.

The class for 350 c.c. machines proved a repetition of history—a duel between 2¾ h.p. Sunbeams and A.J.S., the speed of these ultra-efficient single-cylinder machines being really wonderful; they were not perceptibly slower than the 500 c.c. mounts which followed.

Competitors waiting to descend the hill at the end of a class

Tarred with the Same Brush.

Though "standard pattern" machines were called for in Classes 6 and 7, we regret to have to observe that standard machines were conspicuous by their absence, despite the splendid entry. Practically all were T.T. mounts; we do not recollect seeing a single standard chain case on the chain-driven mounts, there were no such things as footboards and pedals, and even silencers were dispensed with. We heard of no protests, however, which rather suggested that most regarded themselves as on an even keel with their rivals.

Petty on the Norton was the first to show us what a modern 3½ h.p. mount can do, flashing over the finishing tape at express speed. Two Triumph exponents on the programme in this class, viz., Harrison and Cocker, were expected to show up well, but, unfortunately, Harrison was a non-starter, owing to an accident sustained during the week. Cocker, however, who used a T.T. mount with a Philipson pulley, did remarkably well, his speed in the middle of the hill being greatly admired.

COVENTRY AND WARWICKSHIRE MOTOR CLUB'S HILL-CLIMB AT STYLE COP, RUGELEY.

S. A. Rowlandson and his wind-cutting disc wheel Rudge sidecar, winner of a formula prize.

Davies on the Sunbeam managed to beat him by a fraction, the three-speed gear giving him an advantage in getting off the mark. His plan of operation was to start his engine and wait on the starting line for the signal to go. Immediately he would let the clutch in and his mount would spring forward with a bound. The Sunbeam rider was especially fortunate, as he was fastest in both Classes 6 and 7. Rowlandson sat his single-geared Rudge very neatly, and finished very fast. Wade is a rider who can always be expected to do well on his Zenith. A non-starter was George Brough, who had gear box trouble in practising on the hill with his horizontal twin, which he had tuned to perfection.

The "All Comers" Class.

The "open" class was the best supported with twenty-nine entries, ranging from the diminutive Levises to the fleet of 8 h.p. twins, handled by such expert drivers as Harry Reed, J. J. Cookson, A. Mackenzie Cott, S. Briggs, and A. J. Brewin. The honour of accomplishing fastest time fell to the last-named and his 8 h.p. Zenith-Gradua, his speed being terrific. Brewin told us that his speedometer registered 75 m.p.h. on the fastest stretch, which we can well believe, as he averaged over 59 m.p.h. Cott was handicapped by his single-gear, but was nevertheless easily fastest of the generals. Colliver's 7 h.p. Indian got away well, but the engine seemed to choke when approaching its maximum revolutions.

The Passenger Motor Cycles.

The sidecars were not numerous, but credit for fastest time in the 750 c.c. class went to Wade and his 5 h.p. Zenith, the plucky 3½ h.p. riders who had entered being naturally outpaced by him and Frank Smith (Clyno). The award in this class was, however, decided on formula, as also was class 10 for sidecars up to 1,000 c.c., in which event Brewin (who, by the way, is an amateur) added to his laurels by the fastest passenger climb in 55s. G. H. Fry would have done much better on his white Zenith had not the belt broke fifty yards from the finishing line. The impetus of his machine was sufficient to carry him over the line at a good speed.

Another striking machine was Brigg's silver-plated Campion, on which he has won many awards, but single-geared machines have little chance against variable gears in hill-climbing events, especially when standing starts are the order, as in the Coventy Club climbs.

The cycle car event was made up of five light cars and a belt-driven Buckingham, which latter stuck halfway up the hill owing to the timing gear slipping. A Morris-Oxford, driven by the designer, was first in 1m. 28s.

The Organisation.

The event was run off very smoothly and promptly but for unavoidable traffic delays, and no incident of any kind marred the proceedings. At the end of each class an Excelsior "commercial" sidecar took the times up the hill, and as the different classes were worked out, the same vehicle, which carried a blackboard, descended the hill slowly with the results chalked on the board, so that spectators assembled all along the hillside could follow the proceedings. The weighing operations were conducted in a siding at the top of the hill, and each competitor in the formula events was weighed together with his machine just as he had ascended the hill.

The complete time results were posted in the Shrewsbury Arms Hotel at 5.30 p.m., and the formula results were issued on Monday morning.

The Results.

The formula results were calculated on the formula recommended by *The Motor Cycle*. viz., $\frac{C \times T^2}{W}$. In most cases experts competed for time awards only, the "generals" sharing the formula prizes.

OUR ADVICE TO CLUBS

At a time when every motor cyclist is anxious to serve his King and Country, and when all army vacancies are for the present filled, the advice of "THE MOTOR CYCLE" to Club Committees is to encourage members to cultivate assiduously an intimate knowledge of their own particular localities, to become well versed in the art of map reading, and practised in the handling of a rifle, so that, should their services be required they will be as useful as possible.

Ordinary competitions having been cancelled, Clubs might well arrange map reading contests and reconnaissance tests in districts not occupied by troops.

AN ENFIELD TWO-STROKE

The First Model Makes its Appearance at the Coventry Hill-climb

THE Enfield Cycle Co., Ltd., of Redditch, are yet another of our large manufacturers who have turned their minds to the two-stroke question, and the first of their productions in its experimental form made its *début* at the Coventry and Warwickshire M.C. hill-climb on Saturday last. It is a very neat looking mount. It is interesting to note that the Enfield engine is in no way a copy of existing machines, but the designer has struck out boldly on lines of his own. Perhaps the most interesting feature is the slide valve employed to control the port openings. It is actuated from the crankshaft, and it is claimed that the petrol consumption is considerably improved by its use. The magneto is carried behind the cylinder, and at present the engine is mounted in a loop frame, though we are given to understand that in its final form a divided frame will be standard and that the engine will be so constructed as to make a unit with the already well-known Enfield two-speed gear.

Accessibility well Studied.

The bore and stroke are 70 × 72 mm. respectively, but the slide valve gives the engine the appearance of having a longer stroke. Care has been taken to render all detail work accessible, and all ports are arranged slightly on the skew, so that they may easily be inspected without interference from the frame. An Amac carburetter was in use, but the type of magneto has not yet been definitely decided on.

A Show Suggestion.

The Motor Cycle this week makes the suggestion that the car and motor cycle shows be combined this year in view of the war.

International Cycle Car Race Abandoned.

The Auto Cycle Union has decided to abandon the international cycle car race originally fixed to take place in the Isle of Man on September 24th. It is the intention of the Union to hold this race as soon as circumstances permit, but it is of course impossible at present to make any definite statement as to the probable date on which it will be held.

Puzzle, Find the Hill!

The Coventry and Warwickshire Motor Club have achieved fame as the result of their hill-climb at Style Cop last Saturday, first of all because it broke a period of club inactivity since the war began, and secondly because two motor journals announced the venue of the climb as Porlock! As Porlock is only about 160 miles from Coventry, it would be a distinct feather in the cap of even the modern machine to be able to go such a distance to a climb and back in a week-end. And what about the Auto Wheels?

A Danger Spot.

An exceedingly dangerous spot is a bend about one and a half miles on the Chelmsford side of the Fox and Goose on the Ongar-Chelmsford Road. There have been many serious motor cycle accidents at the spot, and we regret to have to record that a fatal accident occurred there on the afternoon of August 23rd, when Mr. Percy Sheldrick, of Enfield, was killed when driving his wife and little son in a sidecar round the bend. A verdict of accidental death was returned by the coroner's jury, and the dangerous nature of the road was shown by the evidence that Mr. Sheldrick was proceeding at quite a moderate pace. The corner is a right-angle one, 12ft. wide, and the surface is loose, and there are several ruts. The jury recommended that the attention of the authorities be called to the spot.

A.A. and M.U. Notes.

WARNING TO MEMBERS.—While the present conditions prevail, members of the Automobile Association are advised to abstain from unnecessarily using the roads after dark. They are also particularly urged to drive very carefully in districts where sentries are on duty, and to stop immediately the request to "Halt!" is made. It need hardly be mentioned that failure to observe this rule involves serious risk to motorists.

It may not be generally known to prospective tourists in Devonshire that a new road has been constructed enabling motorists to go from Lynton to Lynmouth without encountering any abnormally severe gradients. The average gradient of the new road is 1 in 16, with a steepest portion of 1 in 12. Arrangements are being made whereby the new road will be adequately signposted by the Association, also by the authorities.

SPECIAL FEATURES

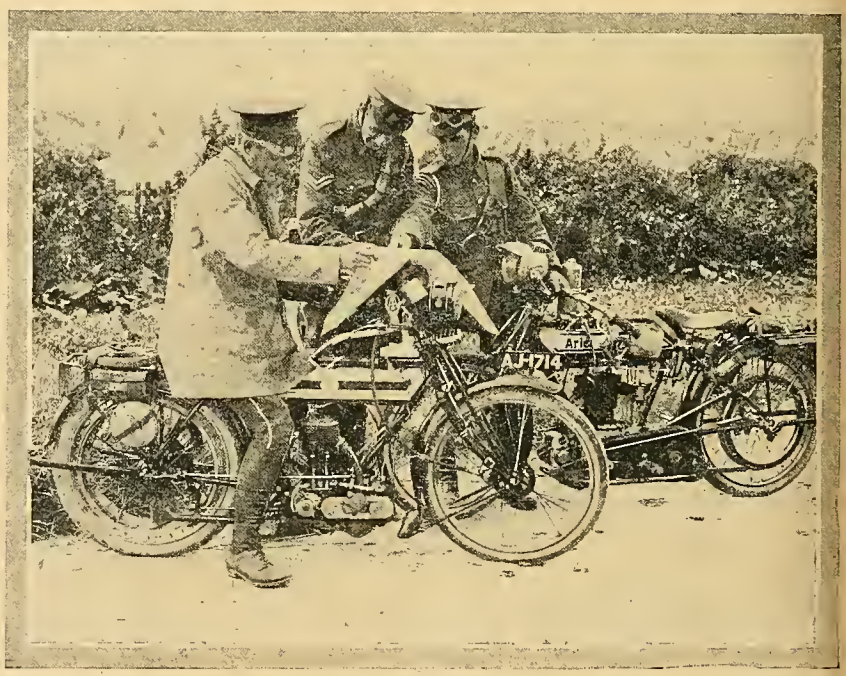
COVENTRY CLUB'S OPEN HILL-CLIMB.

SIDECARS FOR RED CROSS WORK.

AMALGAMATE THE CAR AND MOTOR CYCLE SHOWS.

Manufacturers and the War Office.

We understand that Messrs. Phelon and Moore have supplied the War Office with a consignment of P. and M. motor bicycles, and the company is now working at high pressure to cope with the remainder of the War Office demands. With each section of the Royal Flying Corps a P. and M. motor bicycle and sidecar form part of the regulation equipment. The machines are standard in every respect with single-cylinder engines, two-speed gears and enclosed chain drive.



CONSULTING THE MAP.

P. C. Collier and comrade, who are attached to the Queen's Own Yorkshire Dragoons. The machines are a Triumph and an Ariel. One of the greatest assets from the point of view of a military despatch rider is an intimate knowledge of roads and map reading.

FROM "MOTOR CYCLING," OF CHICAGO, U.S.A.

A cartoon culled from an American journal, which is accompanied by false statements, to the effect that "European manufacturers are cut off from the Colonial markets owing to the blockades of ports and the prospects of capture by the enemy," and, therefore, "American manufacturers should get busy." But, as every Britisher knows, our Navy has swept the seas, and practically all trade routes are still open. Moreover, British manufacturers are still executing orders from Overseas markets.

S. R. Axford's New Post.

Sydney R. Axford, the well-known rider, has recently been appointed as leading mechanic, first grade, Air Craft Department of the Royal Navy.

A Lucky Escape.

Dr. Low and his brother were recently working in their laboratory, when someone fired two revolver shots at them through the window. Fortunately both shots went wide and no damage was done. The man who is alleged to have been responsible for this dastardly attempt at murder has been arrested. He is, we regret to say, an Englishman. Dr. Low has been busily engaged in Government work lately.

From Motor Cycles to Aeroplanes.

Harold Karslake, now Corporal H. Karslake, of the Royal Flying Corps, writes us a cheery letter, saying he is hard at work preparing a squad of aeroplanes for service at the front and that he expects to go with them. His experience in turning air-cooled engines has stood him in good stead in tackling the somewhat *difficile* Gnome motors, and he says many little racing tips from motor cycle practice are applicable to the Gnome. Incidentally, he mentions that two foreign spies were captured at Brooklands last week and their car commandeered.

Exclusive Features in this Issue.

Following upon the first details and illustrations in our last issue of the new Sturmey-Archer counter-shaft gear, the Splitdorf dynamo-magneto machine, and the Albion counter-shaft gear, we publish exclusively in the present number, illustrated descriptions of the

Starley tubular wheel for motor cycles,
Henderson dynamo lighting set,
First Enfield two-stroke machine.

An illustrated description with both time and formula results of the Coventry and Warwickshire M.C. hill-climb (which attracted 100 entries), and an exclusive account of a reliability trial at the Cape are also features of the present issue.

The Scope of the Sidecar.

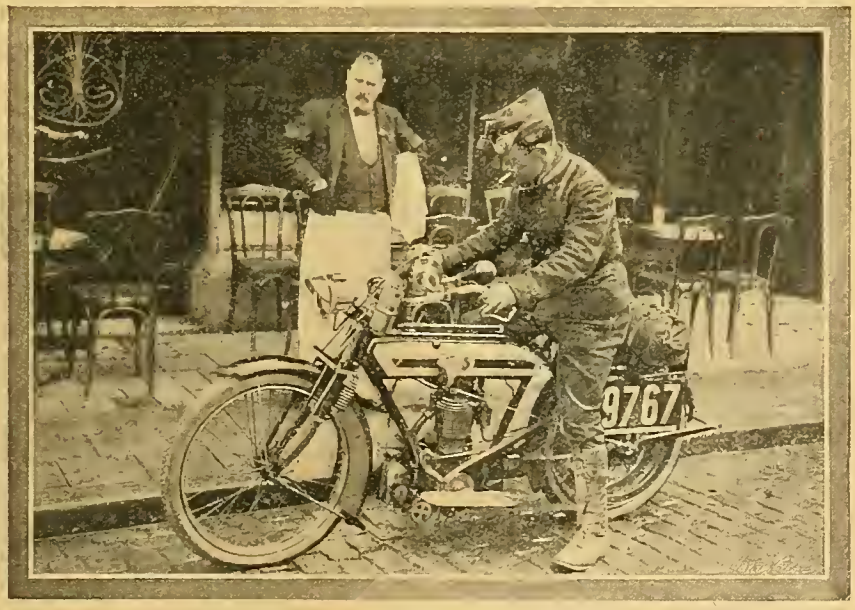
A fortnight ago in these columns we dealt with "The Sidecar as a Commercial Vehicle," pointing out the possibilities of such a low-priced outfit and illustrating several examples. This week we deal with another important possibility for the sidecar, viz., as a Red Cross ambulance vehicle. Some time ago we illustrated the first of these vehicles, and makers have not been slow to recognise their usefulness. This week we illustrate and describe a number of different designs, and we believe we are correct in saying that it is only a question of time before sidecar ambulances receive official recognition.

Two Sides to the Competition Question.

The letter issued by the A.C.U. urging clubs to "carry on" as usual seems to have given offence in some quarters. This, after all, is not surprising. Many people look upon competitions as events solely to amuse; they overlook altogether the business side of the question. It would, however, be deplorable if competitions were the means of hindering young unmarried men from enlisting when their King and Country need them.

An Appeal to Play Fair.

Since the declaration of war police trapping has almost entirely ceased, and in only one district in London, namely, Highgate, have we heard of any police traps at all. The reason for this cessation of persecution of motorists is obviously due to two reasons, the first being that many motor vehicles are being used in the service of the Government, and secondly owing to the police force being depleted through many of its members being called out to join the Reserves in both the Navy and Army there has been no one to work them. It is indeed pleasant to think that the roads are as free and open in this country as they are in France, but we most earnestly beg motor cyclists not to take unfair advantage of their present immunity. If there are numerous complaints, no matter in what district, the trapping is sure to be started again. Last week-end on the Ripley Road three constables were employed to estimate the speed of motor vehicles which passed them, while we would also like to point out that the new force of special constables lately enrolled will release more policemen for control duty. There have been numerous cases of fast driving in places where fast driving is dangerous, and we would therefore earnestly impress upon motor cyclists the necessity to drive with due caution in places where caution is necessary. Taking advantage of an opportunity like the present is not playing the game.



A Belgian motor cyclist despatch rider who bravely brought despatches through the German lines from Brussels to Antwerp

INVALIDED HOME.

Chat with a Well-known Motor Cyclist in Hospital.

VERNON BUSBY, the well-known motor cyclist, has been invalided home from the front, having had his leg damaged by a bullet wound. On Tuesday we had a chat with him in hospital and learned that he saw a good deal of the fighting in the heart of Belgium when the British troops first came into contact with the enemy.

The journey to the front *viâ* Ireland occupied two and a half days, and Busby (whose rank was Corporal, R.E. Signalling Section) had to proceed to a rest-camp, which was reached by a circuitous route over very bad roads, made worse by an excessive amount of rain. The camp was finally reached, but at times the wheels of his 3½ h.p. T.T. Sunbeam almost to the axle were buried in mud. It was a tedious process, as every mile the section had to halt and wait for the troops to come up. The section was under the command of Lieut. Selwyn, R.E., who has a Swift cycle car loaded with petrol tins.

On one occasion the officer's car was absolutely immovable in thick mud, and it took twenty men to clear it. In the afternoon the order to advance was given, and they had to make their way

Vernon Busby, who has been invalided home from the front.

back to ——. Busby slept in a guard's van, in company with Featherstonhaugh (of the Rover Co.), Kayzer (an Oxford man), and several other despatch riders.

On arriving at the centre of operations, Busby's first duty was to take over an officer's machine, the big end of which had seized. Still another had to have the same attention in a field workshop.

Most of the time Busby was acting as Artificer-Corporal in a Signal Station.

From the south-east of Mons he had a magnificent view of the great battle, and saw many German aeroplanes, which, unfortunately, accurately discovered the position of our troops. Matters became so serious that the motor cyclists had to go out in pairs, and were instructed to drive with one hand on the handle-bars and carry a revolver in the other. Their duties were to cut the telegraph wires before the order to retire was given.

One of the most important works they had to carry out was the finding of an ammunition column which had gone astray. The authorities were exceedingly pleased with the motor cyclists' work, but the roads hampered progress. Unfortunately, too, the machines were not too well used, and a number were damaged by inexpert handling. In the heavy fighting which took place several motor cyclists were killed; one, a doctor

WELL-KNOWN MOTOR CYCLISTS IN FRANCE.

V. Busby (Sunbeam), H. B. Blower (Douglas), and G. Featherstonhaugh (Rover), members of the Special Motor Cycle Corps of the Expeditionary Force. This corps went over to France soon after the outbreak of hostilities.

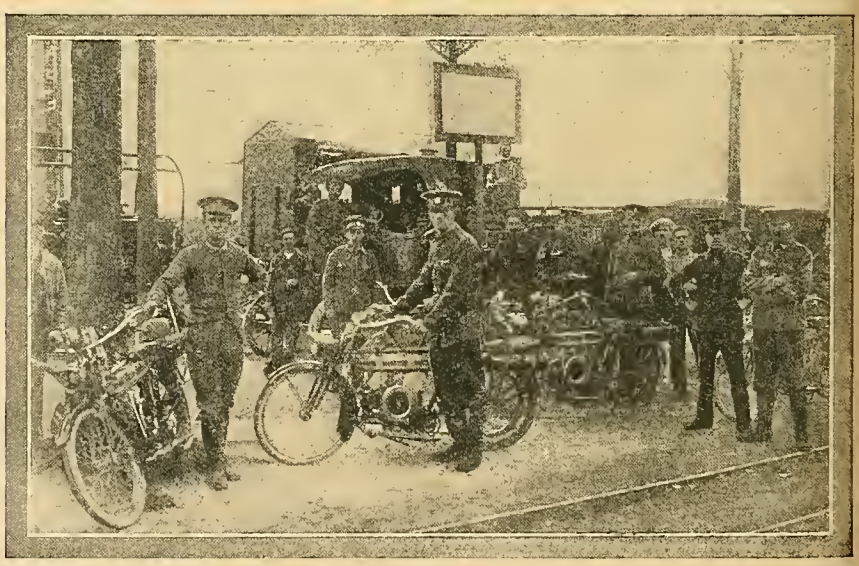
on a Rudge, was said to have been blown to pieces by a shell.

Among the well-known riders who Busby met on the Continent we may mention Begley, who stated that he had shot several Uhlans. The Fifth Division, among whom were the two Burneys and the two Roberts's of Blackburne fame, suffered very heavily, and news of them is anxiously awaited. The Germans appear to have any number of aeroplanes. At one time Busby saw a Zeppelin manœuvring over the battlefield, against which a terrific bombardment was levelled, but it eventually escaped.

Busby's wound is, happily, slight, and he is expected to be out of hospital in a fortnight or so.

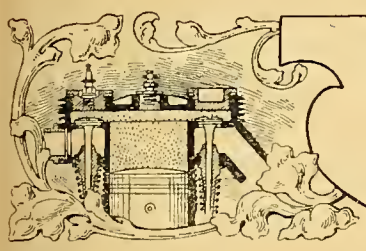
War Risk Rate Reduced.

The War Risk Rate for cargo insurance was again reduced on Tuesday morning from three guineas to two guineas per cent. This reduction, it is considered, will very considerably stimulate British oversea commerce.



WITH THE ENGLISH ARMY IN FRANCE.

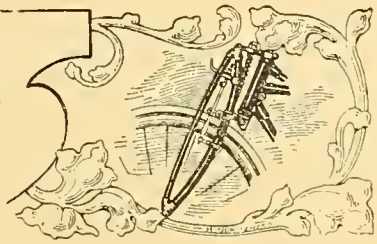
A transport section accompanied by a number of military motor cyclists, all mounted on Douglas machines owned by the War Office.



Hints for Beginners.

SECOND INSTALMENT.

ON THE ROAD.



THERE are so many types of gear that it would be futile to attempt advice for every make, but the following tips will be found correct in general practice. With hub gears the change should always be made fairly quickly. When changing up raise the exhaust lifter momentarily, but this is not generally necessary when changing down unless the gears do not at once follow the action of the lever; even then it is better to declutch for a second.

With counter-shaft gears it is better to change up fairly slowly with the exhaust lifter raised, and the bigger the gap between the ratios the slower the change should be made. When a clutch is fitted it is usually as well to use it gently. To change down use the clutch alone and move the lever firmly across; the revolving parts of motor cycle gears are seldom heavy enough to necessitate double clutching.

One of the first needs on the road is to get accustomed to the feel of the brakes, and before serious touring is undertaken the rider should be able to put on the brakes automatically in an emergency. Use the brakes sparingly, and when possible slow down on the throttle some time before it is necessary to stop. A sudden application of a harsh brake is more apt to cause skidding than almost any other cause. Especially is this the case with a front wheel brake, and should a front brake be at all sudden in action it is well to use it with the utmost care.

Steering is an easy matter unless a sidecar is attached, and then anyone who is used to riding a pedal tricycle will have but little difficulty. Those who have no experience with three-wheelers should go slowly and remember to lean in towards the inside of the curve or corner until complete confidence has been acquired.

How to Manipulate the Clutch.

When the engine is firing it should be slightly accelerated before letting in the clutch, but *never* race the engine when running light, and do not accelerate more than is necessary. A little practice will soon show how fast the engine should be run to take up the drive gently. Never do anything on a motor cycle hurriedly. Let your clutch in gently, be steady with your brakes, change speed firmly but do not slam your gears in. Advance the spark gradually and open the throttle gently. Take your corners slowly and in as wide a sweep as possible, and, above all, learn to use all controls without needing to look for them. Then when you get in a tight place or have to drive at night you can keep your eyes on the road ahead and your feet and hands will work automatically.

If you wish to keep the plated parts in good condition throughout the winter coat them well with vaseline, and the accumulated mud and dust can afterwards be easily removed with a rag.

Causes of trouble are nowadays few and far between, and the symptoms can only be traced after some experience, consequently only a few of the most likely faults will be mentioned. After a little experience it becomes almost second nature to know where to look for trouble.

Tracing Faults.

A sooted plug is generally caused by over oiling, and the machine will usually misfire and stop or cease firing quite suddenly. Under these circumstances remove the plug and examine the points. If they are shorted or joined by a piece of carbon or drop of oil, it is best to scrape the points and then wash the plug in clean petrol. Before replacing it in the cylinder, connect up the high-tension terminal and lay the plug on the cylinder in such a manner that, though the body touches, the central electrode and terminal are clear. Revolve the engine smartly by hand or foot, and if a spark occurs between the points all is well and the plug may be replaced once more. If, however, there is no spark try another plug; if this fails to give a spark, see that the terminals are properly affixed to the magneto and plug; see, also, that the magneto is clean and dry.

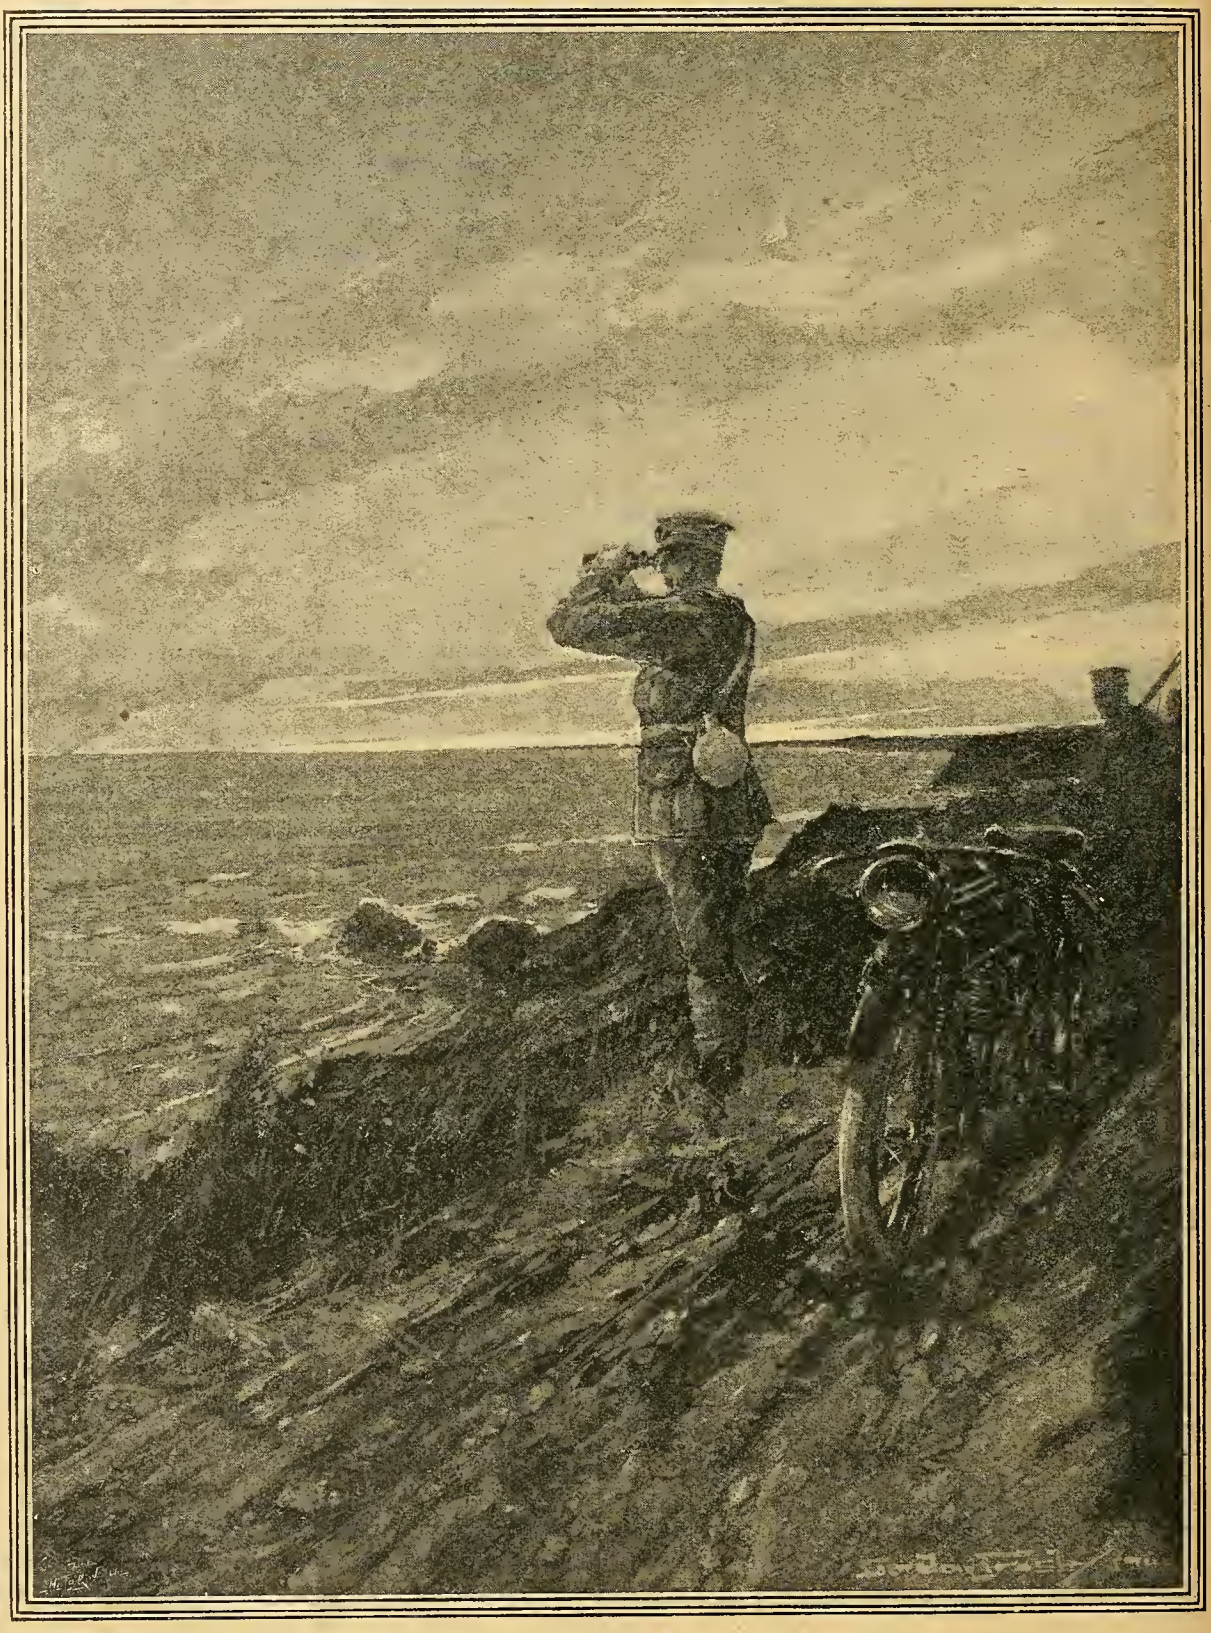
Guarding Against a Seizure.

If this does not effect a cure, make sure the rocker arm in the contact breaker is free. A choked jet generally stops the engine to an accompaniment of loud pops or one loud pop. In this case the jet should be carefully removed and examined. A very small piece of dirt will choke a jet, and must be removed without damaging the jet nozzle; a strand of Bowden cable is excellent for cleaning purposes. Make sure that the petrol is reaching the float chamber and jet, as it is possible that an air lock has formed or dirt has blocked the pipe or passages, which will, of course, need cleaning under these circumstances. It is not uncommon for a beginner to run out of petrol and then spend quite a long time searching everywhere but in the tank for the cause of the stop.

A seizure is possible in the case of a new engine, and can only be guarded against by liberal oiling. The symptoms are those of a drag on the machine, the engine running harshly and stiffly, and getting gradually slower, while it usually emits loud knocks. Under these circumstances stop at once, inject oil copiously, and revolve the engine steadily by the kick starter or pedals in order to splash the oil over the interior of the engine before restarting.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected matter will only be returned provided a stamped addressed envelope is enclosed for the purpose.

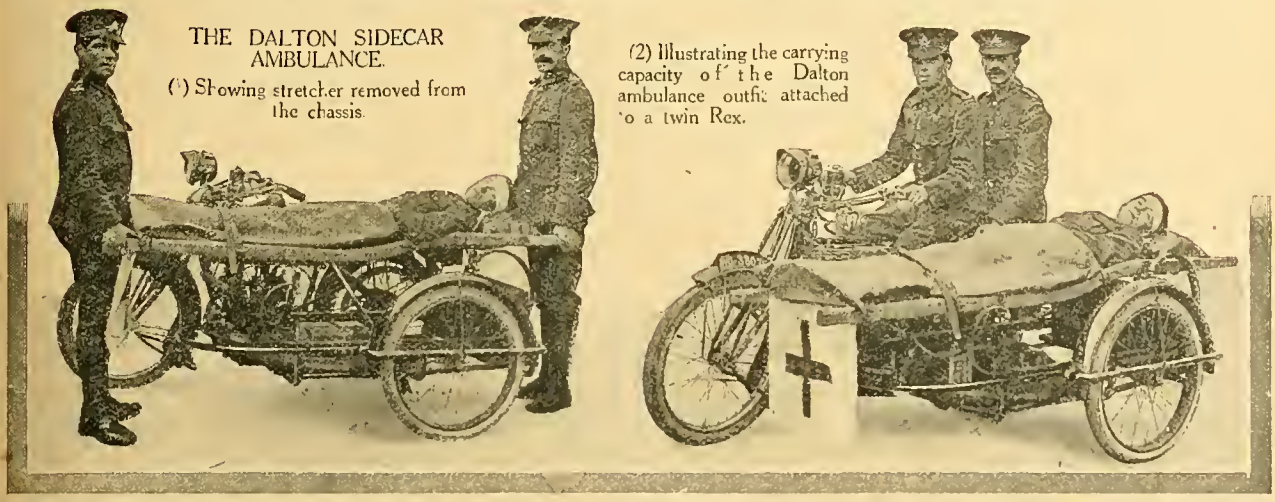


DAWN ON THE EAST COAST.

Many motor cyclists are at the present time employed in the defence of our shores, the North Sea Coast being specially guarded

SIDECARS FOR RED CROSS WORK.

A New Form of Ambulance likely to Prove of Great Utility.



THE DALTON SIDECAR AMBULANCE.
(1) Showing stretcher removed from the chassis.

(2) Illustrating the carrying capacity of the Dalton ambulance outfit attached to a twin Rex.

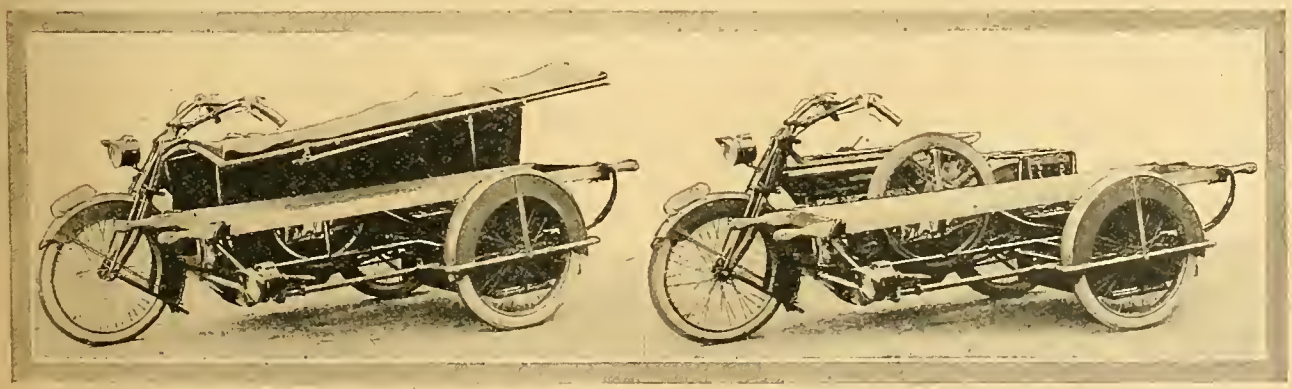
RAPID and comfortable removal of the wounded is one of the most urgent necessities imposed by the horrors of modern warfare. Over anything like rough country the large well-sprung motor car ambulance is pre-eminently the best method to adopt, but the motor cycle can fulfil exceedingly useful service, especially in meeting the boats coming with wounded to transfer them from the quayside to the hospital. The excellent roads in England are well-suited for such machines, and we are glad to see quite a number of well-thought-out outfits appearing from various factories. Smooth running is, of course, of paramount importance, and to that end we should suggest that low compression twin-cylinder engines would be the most advantageous to use. Speed in the way we understand speed in regard to motor cycles is not desirable, for, of course, a speed of twice that of a horse is fast for an ambulance, though moderate for a motor cycle. And, needless to say, no possible risk should be run with such a burden, and such a machine should be equipped with the best and most sensitive system of springing of the stretcher as it is possible to obtain. If the sidecar wheel could also be sprung, so much the better, for what would pass as unnoticeable shocks to a healthy, sound man might well be intolerable to one even slightly wounded.

The 8 h.p. Leader.

We illustrate two aspects of the new sidecar ambulance produced by the Leader Motor Works, Station Road, Bristol. The power unit is an 8 h.p. Precision, and an excellent feature is the fitting of detachable and interchangeable wheels, the method of carrying the spare wheel being particularly neat. Considerable space is provided in a large locker at the rear of the sidecar chassis for bandages, surgical appliances, etc., while a spare two-gallon tin of petrol is also carried. The stretcher is carefully sprung fore and aft, and a removable cover to protect the injured from the elements is well carried out. This can be used as a roof as shown or drawn right down to afford entire protection. Two of these ambulances have already been delivered to the Bristol Motor Cycle War Committee, and others, we understand, are in course of construction.

The Dalton Ambulance.

Our illustration shows a chassis designed by Mr. F. G. Robinson, late of the Bramble Co., for the manufacturers, H. J. Dalton and Co., Croft Road, Coventry.

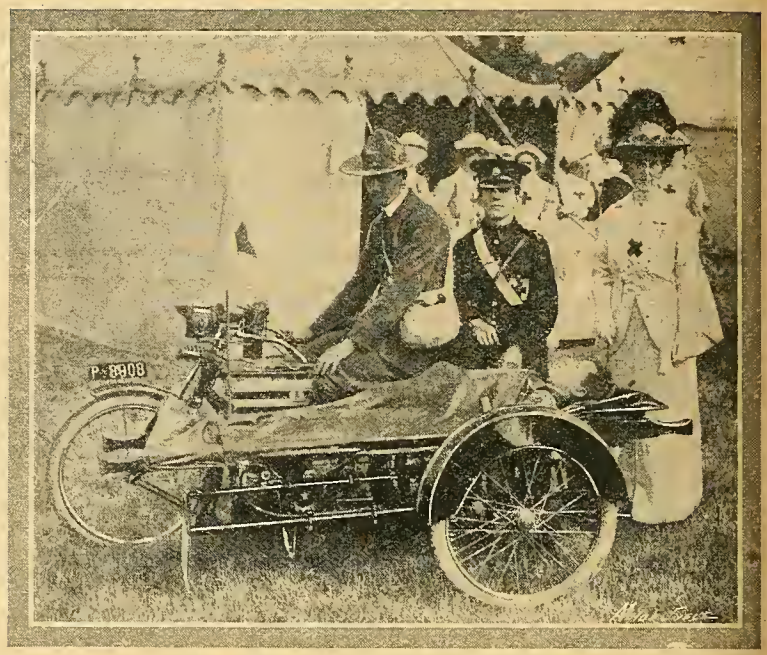


A sidecar ambulance outfit produced by Eli Clark, of Bristol. The cover in the left hand illustration is arranged to fold down on each side.

Sidecars for Red Cross Work.—

The chassis is stoutly constructed and the wheel is carried between two tubes so as to be easily detached, and is extremely strongly mounted. Below the chassis provision is made for carrying tyres, spares, and petrol, and at the back is fitted a roomy receptacle for medical appliances. The stretcher is strongly made and clips to the chassis at four points, and is sprung on a pair of long laminated springs. The construction is simplicity itself, and every detail is well made. An interesting point in connection with the Dalton is that it is probably the first sidecar ambulance to be inspected by the War Office, the designer having driven the machine to London for that special purpose. The sidecar we inspected was attached to a 7 h.p. Rex, and we are told that, after maintaining a high average speed for the best part of 100 miles. the passenger was as comfortable as if in a luxurious sidecar.

The above do not exhaust the number of ambulance sidecars which have been produced, and we are in a position to state that more than one eminent firm have on the stocks examples of this kind of vehicle.



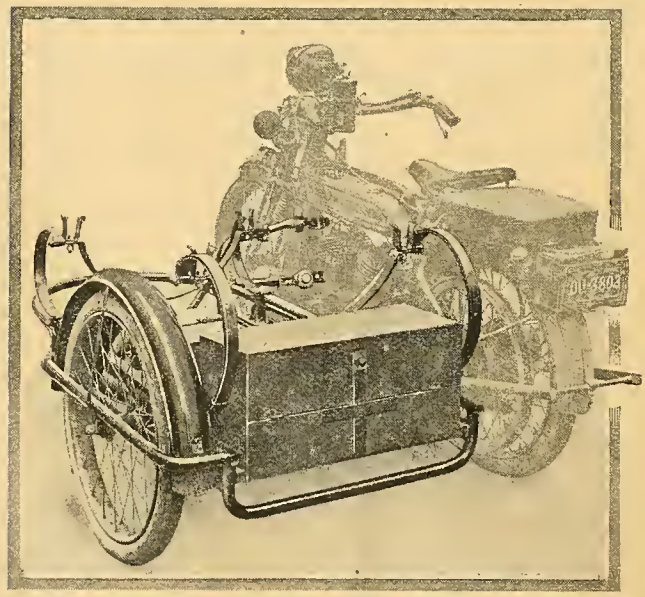
SIDECARS FOR RED CROSS WORK.

The Gloria sidecar ambulance attached to a Triumph motor bicycle. Standing on the right of the machine is Lady Rowley, who is said to have originated the idea of a motor cycle ambulance.

To Capture German Commerce.

Important Action taken by the Board of Trade.

IN connection with the campaign undertaken by the Board of Trade to assist British manufacturers and merchants to secure trade formerly in the hands of German or Austro-Hungarian firms, the Board has received a very large number of enquiries for names of sellers or buyers of articles of which sources of supply or markets have been interfered with by the war.



The locker provided for medical appliances on the Dalton ambulance sidecar.

Special arrangements have been made in the Commercial Intelligence Branch of the Board of Trade for dealing with the enquiries, and lists are being prepared and circulated of articles which enquirers desire (*a*) to purchase and (*b*) to sell. The first lists are now ready, and may be obtained on application to the branch. An enlarged sample room will also be established very shortly for the purpose of exhibiting samples of German and Austrian or Hungarian goods or materials which have competed with British products at home or abroad, especially those which are necessary for the continuance of British manufacture, but which it is now impossible to obtain from their previous sources.

Firms who may wish to exhibit goods are invited to make application to the Commercial Intelligence Branch. It should be expressly understood, however, that the *exhibition is intended exclusively for samples of goods which have formerly been obtained in Germany and Austria-Hungary alone, and which firms may now desire to purchase in the United Kingdom.* Notice will be given of the opening of the exhibition.

A catalogue library will also be opened, and firms who may not desire to exhibit samples are invited to furnish catalogues of goods formerly received by them from Germany and Austria-Hungary; these catalogues to be classified by trades in order to be readily accessible to enquirers.

The address of the Commercial Intelligence Branch is 73, Basinghall Street, London, E.C.

THE WONDERFUL SUNBEAM TRANSMISSION

The 3½ h.p. Sunbeam

is the most suitable and reliable motor bicycle for the war

because of the power of its engine, and its ideal system of transmission.

Soldiers and Despatch Riders will be supplied on Demand.

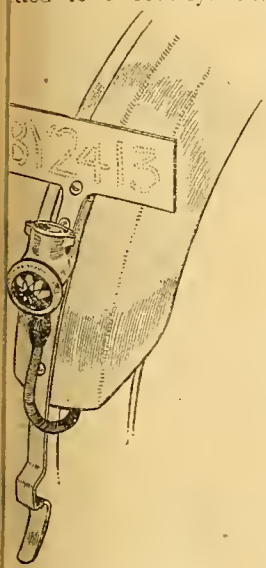
ANOTHER ELECTRIC LIGHTING SET.

A Well-arranged Equipment Fitted to a Four-cylinder Henderson.

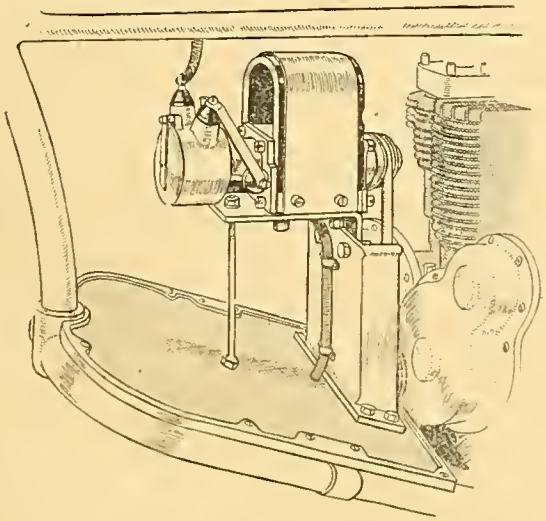
ON the higher-priced and luxurious motor cycles of to-day electric lighting is making great headway, and although prophecy is always dangerous, we feel fairly safe in asserting that in the near future on all really high class machines such installations will be demanded by a fastidious public.

One of the latest sets we have examined is that fitted to a four-cylinder Henderson by the agents, Messrs. Robertsons and Co., Great Portland Street, W. The generator is mounted at the forward end of the engine on a small platform, and is driven by a belt from a pulley arranged on the end of the crankshaft. The construction is quite on accepted lines with that of similar machines, and the workmanship throughout is excellent. The battery is placed in a neat position underneath the footboards, and is practically unnoticeable. A powerful head light is fitted as well as an effective electric horn. The tail lamp is a very sound piece of work, and is mounted rigidly on the rear mudguard. There is a window let in it for illuminating the number plate, and it can also be viewed quite easily from the saddle to see if it is in proper working order. The wiring is carried out by utilising a telegraphic cable, and is taken underneath the rear mudguard and along the top of the frame. It is, therefore, placed out of the way and does not impart a ragged appearance to the machine at all. The whole system works on a low voltage, the globe supplied to the head light working on a pressure of two volts. It is possible to illuminate the lamps without the aid of the dynamo, if necessary, as a cut-out is provided. This mechanism also prevents the battery from becoming overcharged. The general arrangement and appearance is excellent, and a somewhat blank space peculiar to the Henderson machine is filled up in such a way as to give the forward end quite a complete finish. The rear lamp is also of very solid construction, being made of cast aluminium, and should not be affected in any way by vibration.



Henderson tail lamp.

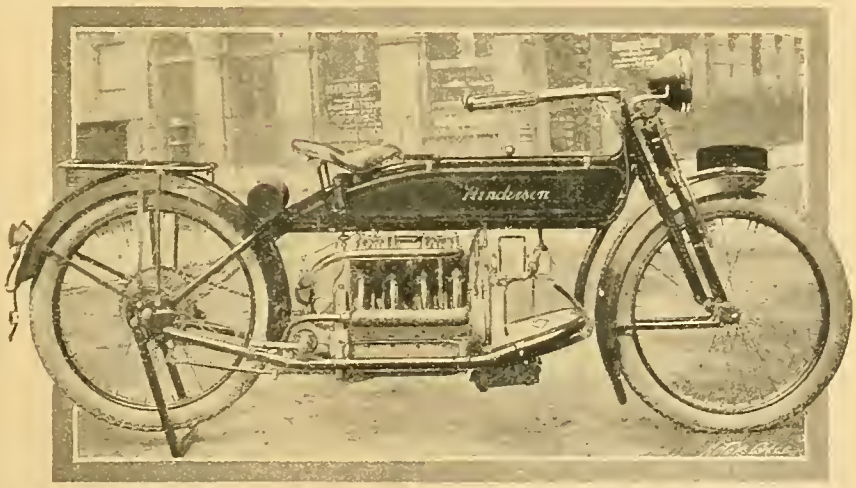
So far, this lighting set has not been arranged on any other machine, but later on, when the above firm have had sufficient experience with this particular set, they will doubtlessly provide sets for other types of motor cycles.



The belt-driven dynamo mounted in front of the engine.

A SIDECAR QUICK-FIRER.

A FEW days ago we noticed in London traffic a machine fitted with a patent sidecar chassis on which a quick-firing gun was mounted on a special bracket. The usual type of body and springing had been dispensed with and in its place was an ordinary pan saddle with a motor cycle type of back rest. This was placed in such a position that the passenger on the sidecar could operate the machine gun whilst sitting there. The whole of the suspension was very carefully carried out. There was also a large number of cases of ammunition carried under the axle in a steel framework, which was suspended by several coil springs.

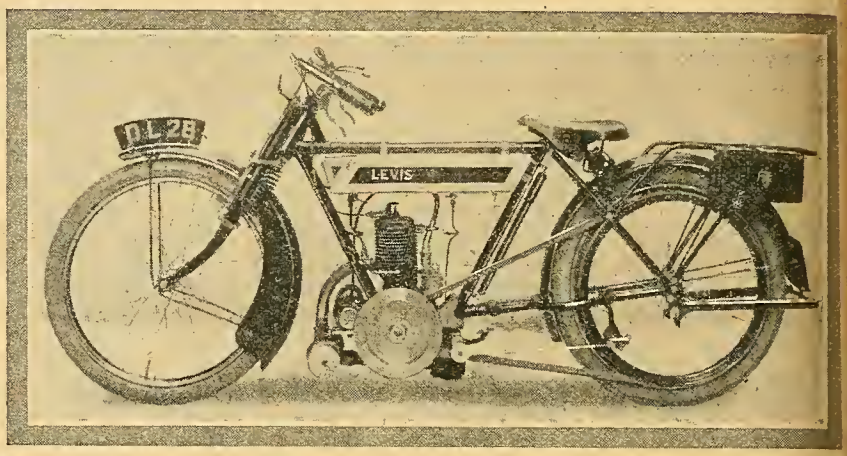


The "electrified" four-cylinder Henderson, now more than ever a car on two wheels

THE LEVIS "POPULAR" MODEL.

A Fascinating Little Machine in which Simplicity is the Keynote.

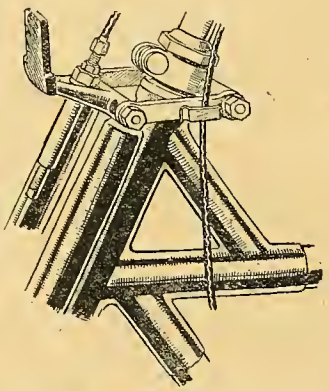
IT was our good fortune on the occasion of a recent visit to the Levis works at Stetchford to obtain one of the new 1.9 h.p. "Popular" models, of which a brief description appeared in *The Motor Cycle* of 20th August, for a short trial on the road. The little machine is fitted with the 2¼ h.p. engine, 62 mm. × 70 mm. bore and stroke, giving a capacity of 211 c.c. A fixed point U.H. magneto is used, and a choice of carburetters allowed the purchaser. The wheels are shod with 24in. × 2in. tyres, and a direct belt drive is employed.



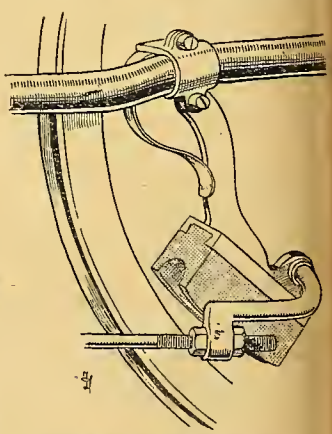
The flywheel side of the "Popular" Levis, showing its remarkable simplicity and low build.

An Appeal to a Large Class of Buyers.

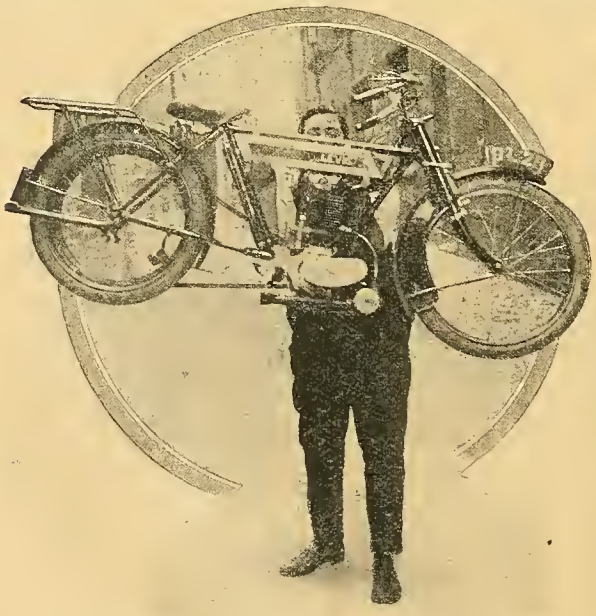
A motor cycle of this type is bound to cause considerable interest to a large section of the community who are hesitating on the brink of purchase, for it is almost impossible to conceive anything more simple in the way of a self-propelled vehicle. The moving parts of the engine, crankshaft, piston, and connecting rod, are all stoutly constructed, and have large bearings, while the well known makes of the accessories fitted may be relied on not to play tricks. A direct belt drive at the worst can only slip or break, and both of these contingencies are minimised by the even pull of the little engine. In fact, though the roads were covered with water from a heavy storm when we left the works, not a sign of belt slip was noticeable. The first point to strike one is the size of the complete machine, which is so small as to make one wonder if it were possible to ride in comfort. This point was very soon settled, for though the writer stands well over six feet a perfectly normal and comfortable position was assumed. This gives serious food for thought as a great many larger machines are not provided with anything like so comfortable a position. In such a low-priced vehicle one does not expect many refinements or much power, but we were really surprised at the flexibility, speed, hill-climbing powers, and detail work of the little Levis.



Steering head lug on the Levis "Popular" model. Note also the clip on the fork link for Bowden wires.



A neat return spring on rear brake of the Levis "Popular" model.



Demonstrating the light weight and handiness of the Levis "Popular" model.

Lightness and Simplicity the Keynote.

Lightness is the keynote of the construction, but this lightness has not been obtained at the expense of strength. On the road the control is particularly simple, for once the engine has been started the air lever may be opened wide and left alone except at a mere crawl, leaving only the throttle for the regulation of speed. Lubrication is on the usual Levis principle of feeding oil to the cylinder and main bearings. A simple adjustment is provided for the flow of oil, and, once set, it is only necessary to turn on the tap when starting and to shut off at the end of a run.

Levis "Popular" Model.—

We feel sure that the Popular model will prove fully equal to its name, for it is a most fascinating little mount. If we have a grumble it is at the size of the saddle, but one cannot expect a luxurious pan seat at the price, and for anything except long touring it is amply large enough. There is no doubt that a machine of this type will open up the delights of the open road to a vast number of potential riders, who have hitherto been debarred by questions of price or frightened by the supposed complications of the larger and more luxurious machines. And many users of heavy high-powered machines would find in the little Levis an excellent tender to their more ambitious machine which would be invaluable for short runs to and from business or to the golf links, or for a variety of other purposes, which will readily occur to the mind, just as the owner of a large car finds utility and pleasure in the employment of a little car to supplement and save its larger brother on many occasions.

Speed Trials at Mablethorpe.

Joint Meeting to be held by the Lincolnshire A.C. and Grimsby & District M.C. & L.C.C.

Joint speed trials will be held on Saturday, September 12th, on the Mablethorpe Sands, by permission of the Mablethorpe Urban District Council, commencing at two o'clock prompt. The classes will be as follow:

Event 1.—Touring solo machines under 350 c.c.
Event 2.—Touring solo machines under 600 c.c.
Event 3.—Touring solo machines under 770 c.c.
Event 4.—Touring solo machines under 1,000 c.c.
Event 5.—Touring two-stroke machines under 350 c.c.
Event 6.—Touring sidecar machines under 600 c.c.
Event 7.—Touring sidecar machines under 1,000 c.c.
Event 8.—T.T. solo machines under 350 c.c.
Event 9.—T.T. solo machines under 600 c.c.
Event 10.—T.T. solo machines under 1,000 c.c.
Event 11.—Team race of three machines.

First prize for four starters, second prize for six starters. Two special prizes will be given by Messrs. M. Jennison and B. Rhodes. Entries close September 8th. Only members of the Lincolnshire A.C. and the Grimsby M.C. and L.C.C. are eligible to compete. The sands are perfectly safe for speeds up to 90 m.p.h.

For entry forms and further particulars apply to either B. Rhodes, Moortown, Lincoln, or M. Jennison, 114, Victoria Street, Grimsby.

GERMAN TEN COMMANDMENTS.

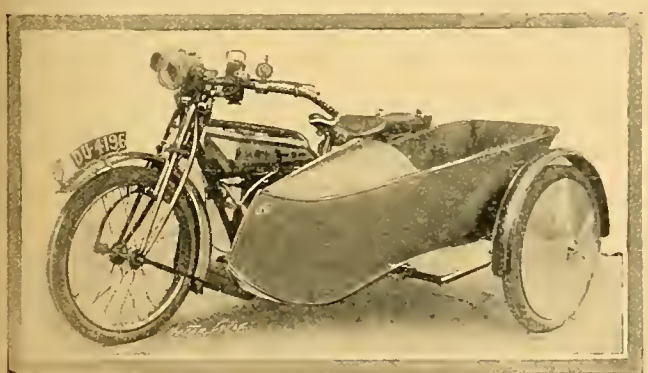
Many thousand copies of the ten German commandments given below have been distributed throughout Germany during the last two or three years:

1. In all expenses keep in mind the interests of your own compatriots.
2. Never forget that when you buy a foreign article your own country is the poorer.
3. Your money should profit no one but Germans.
4. Never profane German factories by using foreign machinery
5. Never allow foreign eatables to be served at your table.
6. Write on German paper with a German pen, and use German blotting paper.
7. German flour, German fruit, and German beer can alone give your body the true German energy.
8. If you do not like German malt coffee, drink coffee from German colonies.
9. Use only German clothes for your dress, and German hats for your head.
10. Let not foreign flattery distract you from these precepts; and be firmly convinced, whatever others say, that German products are the only ones worthy of citizens of the German Fatherland.

WOLVERHAMPTON INVITATION PAPERCHASE.

A paperchase will be held on September 5th in which the following clubs have been invited to participate: the Sutton Coldfield and Mid-Warwickshire A.C.; Birmingham M.C.C.; Kidderminster M.C.C.; and Derbyshire and North Stafford A.C. Cups will be presented to the winning team. The start will be from the Talbot Hotel at 2.30 p.m.

There will also be held on September 19th a twenty-four hours reliability trial for the Cork Cup, open to members of the Wolverhampton Club only.



A disc wheel sidecar on a T.T. Rudge which has been universally admired. It is owned by Mr. V. A. Holroyd, works manager of Rudge-Whitworth, Ltd.

IRISH HILL-CLIMB.

The Dublin and District Motor Cycle Club held a handicap hill-climb on Saturday last at Glencullen Hill. The original idea was to have a number of classes, but these were amalgamated, and the three best men on handicap competed again for the three prizes, a new handicap being framed on their times in the first run off. The results were as follow:

SOLO CLASS.

Rider and machine.	Actual time.	H'cap time.
J. Healy (2¾ Enfield), 10s. ...	... 52⅖s.	... 42⅖s.
J. A. H. Waters (2¾ Douglas), 10s.	53⅗s.	... 43⅗s.
R. Armstrong (2¾ Enfield), 10s. ...	58⅖s.	... 48⅖s.
Dr. Sheill (3½ Rover), 8s. ...	... 47⅘s.	... 39⅘s.
P. J. Fox (3½ Rudge) 5s. ...	... 47s.	42s.
W. A. Campbell (3½ Rudge), 4s. ...	50s.	... 46s.
R. White (3½ Rudge), 2s. ...	... 50⅖s.	... 48⅖s.
F. Holmes (3½ Rudge), 2s. ...	... 41⅘s.	... 39⅘s.
T. E. Greene (3½ Rudge) scratch ..	40s.	... 40s.
P. J. Brady (3½ Rudge), scratch ..	46s.	... 46s.

SIDECAR CLASS.

Rider and machine.	Actual time. m. s.	H'cap time m. s.
A. W. Mooney (6 Bradbury), scr.	1 0⅘	... 1 0⅘
G. Roche (3½ Rover), 9s. ...	1 14⅖	... 1 5⅖
W. J. Towell (3½ Sunbeam) 9s. ...	1 41	... 1 33
J. Levins (6 Bradbury), scr. ...	1 36⅘	... 1 36⅘

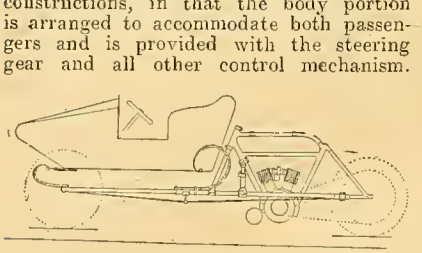
The final between the three fastest men on the handicap resulted as follow:

Rider and machine.	Actual time.	H'cap time
A. W. Mooney (6 Bradbury sc.), 19s.	57⅖s.	... 36⅖s.
Dr. Sheill (3½ Rover), 6s. ...	... 46s.	... 40s.
F. Holmes (3½ Rudge), scratch ...	41¼s.	... 41¼s.

Messrs. N. E. Drury and R. P. Hurse took the times.

An Interesting Tricar.

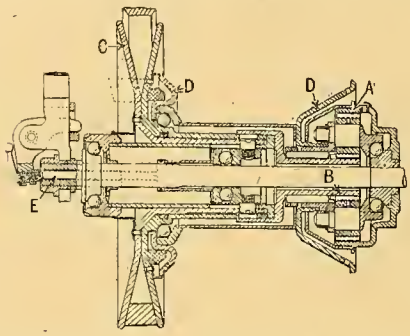
This tricar differs from most previous constructions, in that the body portion is arranged to accommodate both passengers and is provided with the steering gear and all other control mechanism.



The motor cycle seat and handle-bar are therefore removed and the machine driven from inside the body. The body is spring supported from a flat frame, which can be bolted to the motor cycle frame after the front wheel has been removed. The front of the body is flat or otherwise arranged to encourage a draught of air on to the engine.—L. Ainsworth, No. 12,842, 1913.

Reducing Gear.

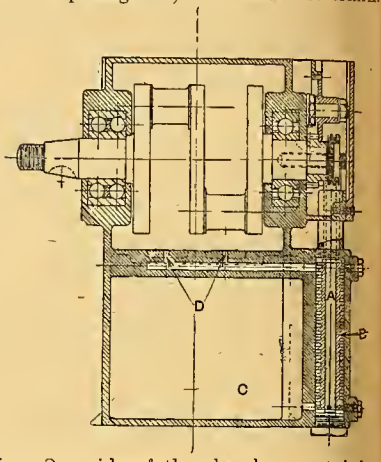
With transmission gearing of the variable pulley type it is not easy to obtain a very low gear. To obviate this an epicyclic gear is arranged in the hub shell. The internally toothed ring A is locked to the frame of the machine, and the sun pinion B is driven by the belt pulley C, and the planet pinions are connected with the hub shell D. The pulley C is formed with a fixed and a movable flange, the latter being operated by the rod E passing through the hollow spindle.



By means of the epicyclic gearing a big gear reduction is obtained. — Rudge-Whitworth, Ltd., and F. Pountney, No. 10,242, 1913.

Douglas Lubrication System.

Driven off one end of the crankshaft is a vertical spindle A, around which is secured an archimedean screw B. The housing in which the screw works is connected by a passage with the oil sump C so that as the engine runs oil is forced into the passages D, into which the crank-



dip. One side of the chamber containing the archimedean screw may have a transparent wall so that the operation of the device can be seen.—W. Douglas, No. 1,744, 1913.

A Business Combine.

The Forward Motor Co., Summer Hill, Birmingham, inform us that they are absorbing the business of the Challenge Manufacturing Co., Birmingham.

Rear Lights for the War Office.

We are informed that Messrs. Westwood Rim and Patents, Ltd., Lawden Road, Birmingham, have received large orders from the War Office for their Westwood reflex rear lights.

Wakefields and the War.

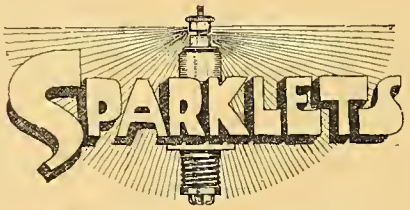
Messrs. C. C. Wakefield and Co., of Wakefield House, Cheapside, London, E.C., are keeping on full pay all members of their staff who are serving with His Majesty's Colours, and will reinstate them on the termination of the war.

War, Work, and Wire.

Messrs. Bowden Wire, Ltd., London, give notice that, with a view to making as little hurtful as possible to their workpeople the temporary reduction of hours which they have found necessary, they have decided to close their offices, warehouses, and works on each Saturday until further notice.

Racing in South Africa.

A large crowd witnessed the race meeting, decided by the Orange Free State A.C., at Bloemfontein, and some fine racing was witnessed. The chief event was the fifty miles race for the Continental Trophy, which was won by W. Campbell on a T.T. Triumph. The actual distance was 52 miles, and Campbell's time of 56m. 56s. beat the South African record. In the Open Five Miles Handicap, Campbell again won from scratch, L. A. Howie (Triumph) being second, and E. Hoehne (Triumph) third.



Tyres for a Powerful Twin.

It is interesting to note that the powerful twin-cylinder Zenith-Green, to which we referred in our issue of August 20th, is fitted with 3in. Palmer cord tyres.

The Petrol Position.

The two leading petrol companies inform us that they have made no change in the wholesale price of their spirit. The Motor Trade Association has agreed to its members retailing spirit at a profit of 3d. per gallon over the wholesale price.

Business Better than Usual!

Kemp's Vulcanising Co., Ltd., Hardman Street, Manchester, report that since the war commenced they have not only experienced business as usual, but even expanding business, particularly in respect of the manufacture of ebonite goods in which they formerly found our enemy a competitor.

A Market in the Philippines.

Advices from the Philippine Islands tend to show that the native Filipinos are taking largely to the motor cycle. At present the demand is mainly filled by American manufacturers, but the desire of the local riders is for a light to medium weight machine, and as this is not usually a characteristic of American motor cycles this should prove a good opening for British trade.

Clutches for Cycle Cars.

An order for fifty chain-drive Mabon multiple disc clutches, manufactured for cycle cars, has just been executed by the Mabon Motor Works, Woodside Gardens, Bruce Grove, Tottenham, London, N. The Mabon clutch is largely used on motor cycles.

Cheaper Sidecars.

In order to keep the works busy, Messrs. W. Montgomery and Co., of Coventry, have decided to allow 15% discount off all sidecars purchased during the war.

The Godiva Sidecar Co. is also offering special inducements as regards terms, having a small stock to dispose of.

Generous Offers.

The Endrick Engineering Co., Olton, Birmingham, have, we understand, offered the War Office a number of Endrick decompressors free of cost, and will hold a stock at the disposal of the military authorities.

Messrs. Morgan and Maxwell, motor agents, of High Road, Streatham, undertook at the beginning of the war to store, clean, and insure motor cycles belonging to members of the naval and military services free of charge until hostilities have ceased.

All about the Rudge Multi.

A most tastefully got-up little booklet has been issued by Messrs. Rudge-Whitworth, Ltd., Coventry, entitled "An Expert on the Rudge Multi." This consists of a beautifully reprinted extract from this journal together with photographs of the technical points of the Rudge Multi. Excellent photographs of C. G. Pullin, the T.T. winner, and T. E. Greene, holder of world's records on a Rudge Multi, are also given.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

Sport and the Crisis.

WITH the cry of the Chancellor to "carry on" ringing in one ear, and the insistent demand of Lord Kitchener echoing in the other for more men for the front, many feel in rather an uncertain position. Those of us who have labour dependent on us, who are married, or have other and near ties which irrevocably bind us to the humdrum civilian life are quite justified, nay more, are obliged to stay. But for those who are young, single, and have no responsibilities, there is but one course—"Go to the Army." It is estimated that there are now in England over three million single men between eighteen and thirty years of age. Every one of these, if medically fit, and if no one's subsistence actually depends upon their earning capacity, is permanently disgraced if he holds back from offering his services. It is nothing short of national disgrace that there should be *married* civilians enlisting while *unmarried* shirkers of their duties lounge at street corners or amuse themselves in idling about the country or attending sports meetings.

These remarks are prompted by the vision of numbers of such young men seen at a recent motor cycle event. Many of the old familiar faces among the competitors were absent—all honour to them for being where they are. We hope that a similar spirit may soon actuate the minds of those who can go but who linger over long before departure. No sport can produce so many eligible recruits as that of motor cycling, and all those young unmarried men who rushed for coveted posts as despatch riders, with the fine emoluments attached, who were too late in the field, should go as fast as their machines can bear them to the nearest recruiting office and enlist as a soldier of the King.

One more word. A great many people seem to labour under the delusion that events in the motor cycle world are merely run to amuse, and that anyone who supports or takes part in them should be at the front, but these people cannot see below the surface. A reliability trial, a hill-climb, a speed event, are merely cogs in the great industrial machine. They may possibly be the lighter side of commerce, but they are none the less commerce. Otherwise, why do manufacturers go to the expense of entering and providing employees to ride and further advertise the results to the world? The answer is obvious, and to practically all *participants* there is a certain responsibility attached in the shape of workmen being employed to reproduce his successful machine and thus cause the circulation of wealth, without which the country would fall. But the idle onlookers do not, for the main part, contribute to this general toil, and are primarily concerned in spending a pleasant afternoon. These are the men who should be swept at once into Lord Kitchener's net. Then, and then only, will the country be proud of them.

A Matter of Conscience.

OF course the actual holding of competitions is a matter of individual club conscience, and we cannot pretend to dictate to such bodies as to what their conduct should be. But we will say that if there is the slightest possibility that the holding of even a few competitions would in any way exert a retrograde effect on recruiting, we would immediately use our utmost endeavours to suppress them. At the same time it must be borne in mind that H.M. the King himself has personally advocated the holding of race meetings and has gone so far as to enter into engagements for his own horses, and many people may well say if horse racing, why not motor cycling? To sum up, we would say that if adequate troops are raised to satisfy the authorities, there is every reason to "carry on" as usual with competitions, but until a public pronouncement be made to that effect, no great number of motor cycle club, or for that matter any other events, can be carried out with propriety.

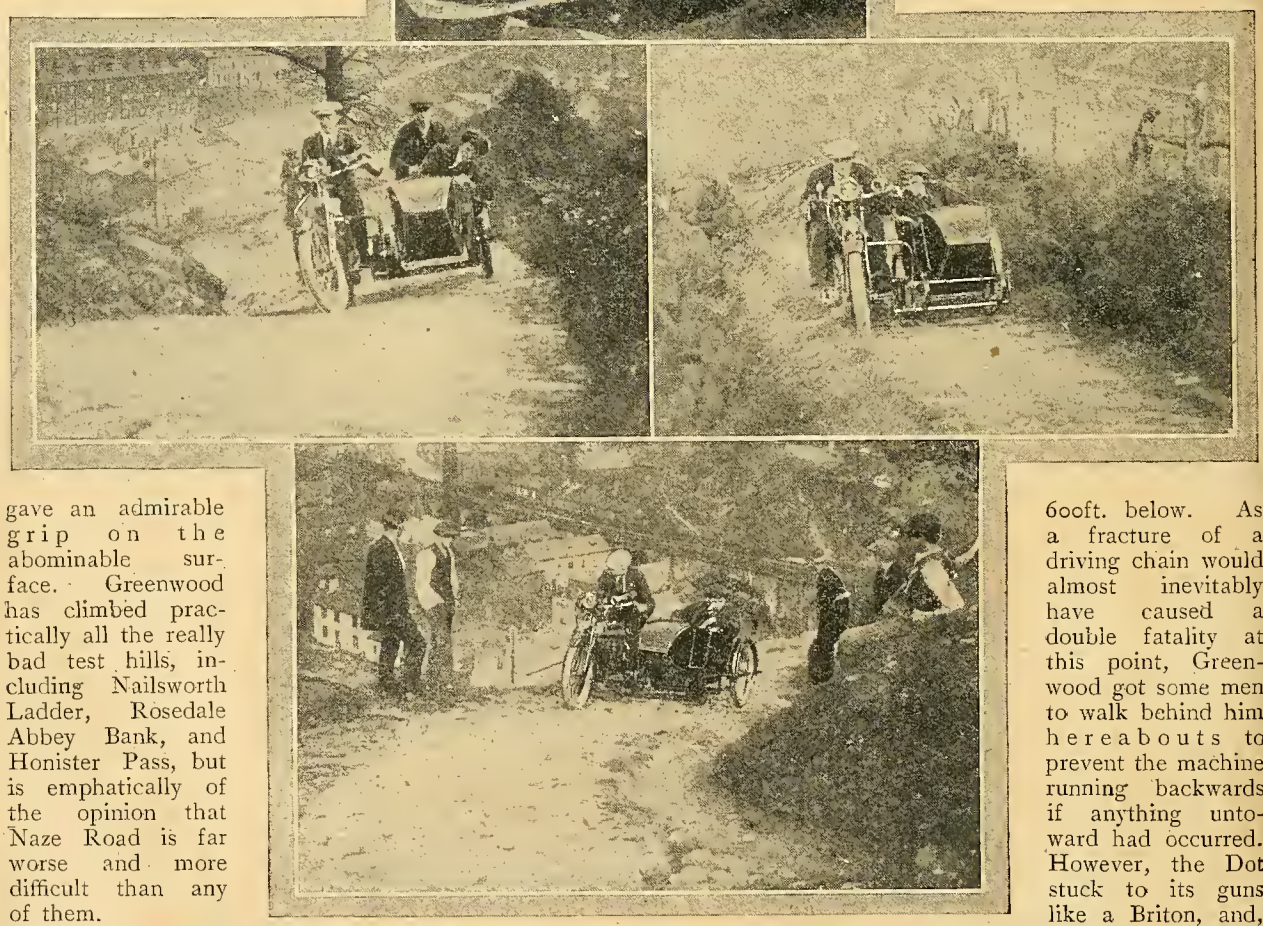
THE VERY LATEST FREAK HILL.

An Account of a Sidecar Ascent of Naze Road, Todmorden.

IN the issue of *The Motor Cycle* of August 13th a letter appeared in our correspondence columns from a reader concerning the discovery of a terrible hill near Todmorden, known as Naze Road. This hill is so severe, and the surface so villainous, that, although technically a main road hill, all goods are carried up on pack horses and donkeys, as it is beyond the power of beasts of burden to draw wheeled vehicles up its stony, rutty gradient.

Hearing that attacks were being made on the hill by sidecar enthusiasts, Maurice Greenwood, the competition rider, decided to attempt the hill on his 8 h.p. Dot sidecar outfit, on which a Jardine gear giving ratios of 4¾, 8, and 14½ to 1 was employed. The power unit was a J.A.P. The tyres were 650 × 65 mm., the rear one being steel-studded, which gave an admirable grip on the abominable surface. Greenwood has climbed practically all the really bad test hills, including Nailsworth Ladder, Rosedale Abbey Bank, and Honister Pass, but is emphatically of the opinion that Naze Road is far worse and more difficult than any of them.

Before attempting the climb, the driver and his passenger walked up the hill for a preliminary survey, and found a number of gutters about six or eight inches deep, which they roughly filled up with stones to prevent the frame of the sidecar being damaged by contact with the ground if the wheel should happen to drop into one of these crevices. The climb starts with a very roughly paved surface, after which it rapidly deteriorates, and the sidecar chassis caught on several of the big boulders sticking out from the track, obstructions which made steering exceedingly tricky, as they flung up the front wheel and wobbled it about badly, despite the efforts of the driver to keep it straight. The first bad bend is a hair-pin with a measured gradient of 1 in 2½, and this is a very dangerous corner, as there is nothing to stop machine and rider toppling over a precipice into a canal 600ft. below. As a fracture of a driving chain would almost inevitably have caused a double fatality at this point, Greenwood got some men to walk behind him hereabouts to prevent the machine running backwards if anything untoward had occurred. However, the Dot stuck to its guns like a Briton, and, despite sparks and showers of stones flying from the



BIRD'S EYE VIEW (AT TOP) AND SCENES DURING THE FIRST ASCENT OF NAZE ROAD HILL, TODMORDEN, ON AN 8 H.P. DOT-J.A.P. SIDECAR.

The Very Latest Freak Hill.—

studded tyre, it gradually forged its way round the bad corner and onwards and upwards towards the summit. Several times the surface became so bad ere the white farmhouse at the top was reached that there was grave fear of the whole outfit overturning and being hurled to destruction down the heights on the passenger's left. Arrived at the summit, the occupants of the farm said that no sidecar had climbed the hill before with the passenger continuously seated in the sidecar.

Out of the Frying Pan—

When the top is reached it must not be imagined that the hardy voyager's difficulties are at an end. In a way they are only just commencing, or, at best, only half way accomplished. Either he must descend Naze Road, an act of folly until brakes are numbered about half a dozen per wheel, or else go on over a rough piece of moor. This Greenwood and his companion decided upon, and soon after had the unpleasant experience of finding themselves upset in a bog, with the outfit sinking before their very eyes. A wild rush to a neighbouring farm to fetch a horse and ropes, and soon the sidecar and machine were hauled to safety on to a piece of solid ground. Arrived back in the valley, the prospectors decided to put the Dot at Watty Scout Hill, which is opposite to Naze Road and runs in the opposite direction. This hill has a gradient of 1 in 3, but was climbed easily enough. Coming down, however, was a different story, for the brake rod broke and the machine shot forward. First speed was jammed in and the machine slowed a bit. The passenger jumped for it, and turned a complete somersault, luckily without serious hurt, and, relieved of his weight, Greenwood managed to pull up after the heels of his boots had been torn off by friction with the ground!

Thus ended about as exciting a day's hill-climbing as anyone could desire. It should be added that no one should try Naze Road with a sidecar without ample power and first-class brakes, tyres, and driving chains. Lack of care with any of these details might easily cause a serious, if not fatal, accident.

Some Lighting Refinements in America.

By ROAD RIDER.

I PRESUME most British riders are aware that the popular illuminant among motor cyclists in the United States is compressed acetylene, stored in cylinders similar to our well-known "D.A.," and known as "Prestolite." But the ingenious Yank is not content with our cruder systems. His cylinder is fitted with a pressure reducing valve; it does not matter how much or how little the careless rider opens the stop-cock, or whether his cylinder contains the full original charge of 6 cubic feet or is down to its last 15 min. In every case the automatic valve reduces the pressure to 2 ounces, and the flame cannot flare or be dim so long as any gas remains in the cylinder. Furthermore, the user does not necessarily dismount to light up at the approach of twilight, for the burner of his head lamp may be fitted with a lighting apparatus at a nominal fee. The lighter may either consist of a spark gap in circuit with the magneto ignition, and operated by a switch on the tank, or, alternatively, a friction striker, similar to those used in petrol pipe lighters, may be screwed to a clip encircling the burner. In respect of weight, cost, and reliability, these refined outfits compare very favourably with the highest ideal electric dynamo.

Some American designers are very outspoken in asserting that the front fork is the only part of the machine on which an electric lighting outfit should be mounted. They claim that this position preserves the delicate batteries, etc., from road shocks, inevitable with a more rearward position; and that motor bicycles already suffer from excess of weight on the back wheel, so that any further weight additions must be thrown forward (several early samples of electric dynamo outfits weigh from 40-70 lb.); moreover, the electrical connections can then be kept short and tidy.

The writer is inclined to regard this doctrine as pernicious nonsense. It is certainly desirable to mount additional weight—if any—on the front wheel from the steering and balancing standpoints; any veteran who remembers the stern-heavy De Dion tricycles will realise how vastly even weight distribution makes for comfort. But it is folly to carry so expensive an item as an electric dynamo in so exposed a position. A lamp nearly always gets damaged in the event of a smash. If a dynamo or battery box is fitted to project sideways or forwards near the prow of a machine, repair bills will rise by leaps and bounds. The Indian position is unsurpassable for a dynamo; its weight is as near the front wheel as possible, but injury in an ordinary tumble is not probable. Designers who employ batteries, and mount them in a rearward position, but without the protection of a rear sprung frame, will soon discover they are asking for trouble; but this is a good thing, for they will all be driven to adopt rear-springing at last, if only to ensure the longevity of their cells.

Three well-known riders in Christchurch, N.Z., who are all mounted on Triumphs. Their names, reading from left to right, are: C. Bonnington, G. B. Brown, and F. Haworth.

THE MOTOR CYCLE MOBILISATION.

A Graphic Description of How the Government Collected Despatch Riders.

BY ONE OF THEM.

THAT the motor cycle is destined to play a prominent part in the present campaign as a reliable and speedy despatch carrier at the front will be judged by the following experiences of one of the special reservists newly enlisted to this branch of service.

It will doubtless come as a surprise to many that the motor cycle has at last come into its kingdom, and has been recognised by the Government as a most valuable asset in modern warfare to such an extent that many thousands of pounds have been spent in originating and maintaining a corps of special reserve motor cyclist despatch riders.

The first I heard of this scheme was on the 5th August at Newcastle-on-Tyne, when I and a friend, like many other young fellows, were looking for a job as volunteers during the war. It chanced that I saw a copy of a circular letter which stated that the Government was forming a corps of special reserve motor cyclists at Chatham, and this induced us to proceed to Chatham immediately and report to the officer in charge of engineers' records at Brompton Barracks. If I had not a machine the Government would supply me with a new one. It also stated that the terms of joining were specially favourable. I was in possession of a 3½ h.p. 1912 Bradbury which had given me a great deal of satisfaction, but my friend, though a keen enthusiast, had no motor cycle at all.

First Come First Served.

Nevertheless, we both took copies of this letter, and, deciding to take the bull by the horns, packed up immediately at short notice, and some three hours later found ourselves in the night train bound for London with my Bradbury in the guard's van. We slept in the train, which was packed with soldiers, as best we could, and arrived at King's Cross in the early morning. From this point the Bradbury conveyed us both to Chatham, my friend riding as a pillion passenger, and so we arrived at our destination at about nine o'clock in the morning.

We soon found that we were amongst the first arrivals when we got to the motor cyclists' recruiting office, as the letter had only been sent out on the previous day. Thus it happened that before the day was out we were attested, medically examined, and finally sworn in. The recruiting office had to cope with about 100 men on the first day, I believe.

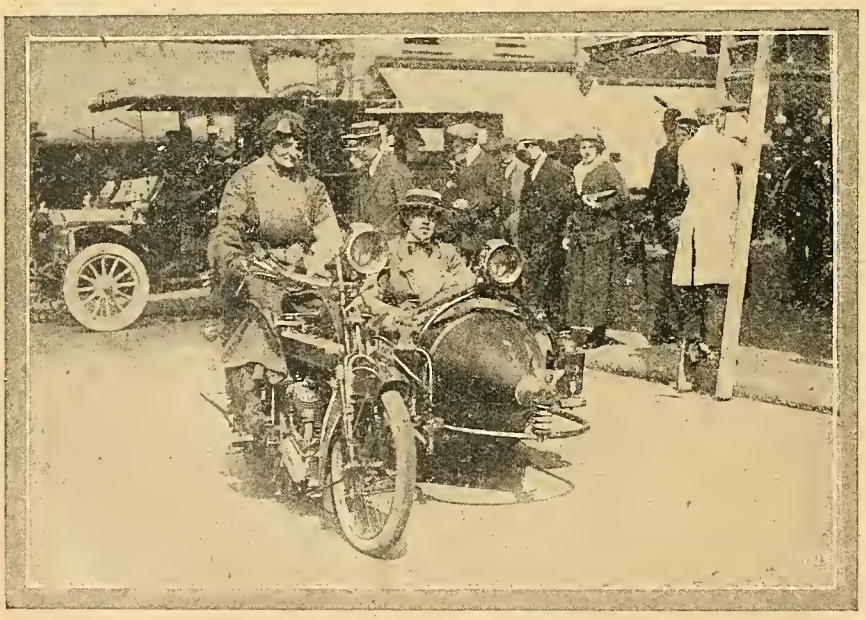
Those men who possessed motor cycles of their own had to give particulars of the same on enlistment. If the machine was deemed suitable for the job and conformed to Government specification it was taken over and bought from the man, so that all the machines used were Government property. My own machine did not quite conform to specification and so was rejected, but this made no difference because it meant that I would be provided with a new machine and that I would get a warrant to send my own home again.

Machines accepted were paid for at the following rates: If the machine was passed and it was a 1914 model, the full price was paid for it. If of an earlier year, 10% reduction was made for the first year and 10% for each subsequent half year, but under no circumstances was the price paid less than 30% off the original price. All men who were enlisted in this branch of the service were ranked as corporals in the Royal Engineers, and drew 35s. per week with a £10 bounty on joining—not bad pay.

We were obliged to find accommodation outside for the first night, and as I had relatives at Maidstone, we made the Bradbury take us both there, which it did without making any fuss about it.

Commencing our Duties.

The next day we did very little beyond watching men pouring in from all parts of the country to the recruiting office. They were much more particular on this day, and rejected men on the slightest pretext. In our case, it had merely been a matter of filling in forms and giving particulars; but now we noticed that such things as not having had previous military training, wearing glasses, slightly stammering, and such things were sufficient to disqualify a man. Again we went to Maidstone for the night, and turned up at Chatham at nine o'clock for parade on the second day, when we had to undergo a little infantry drill, and had a lecture on map reading in the morning. In the afternoon



MEMBERS OF THE WOMEN'S EMERGENCY CORPS.

Several motor cyclist members of this corps have been observed in London traffic handling their machines very skilfully. The outfit is a Chater-Lea with a Gloria Projectile sidecar.

Motor cyclist scouts and despatch riders attached to the Royal Engineers (West Riding Division). The majority of the men belong to Sheffield. This squad appears to be splendidly mounted.

we were despatched to the quartermaster's stores to get our uniform and equipment. Meanwhile several men were detailed off for fatigue work, which consisted of going down to the railway station with the traction engine and waggons and loading them up with crates containing new machines, all Rudge Multis and three-speed Triumphs. Our equipment was very complete, and consisted of the following, among other, articles: Large clasp knife, haversack and water bottle, two pairs of good strong boots, two shirts, three pairs socks, toothbrush, hairbrush, shaving brush and razor, boot brushes, magnificent Webley revolver, Cardigan waistcoat, and many other excellent things beside.

As uniform we got the ordinary tunic with corporal's stripes, riding breeches, puttees, service cap, and brown leather belt with holster for revolver and case for ammunition.

Satisfied with Our Lot.

We went to bed that night with feelings that we were lucky mortals indeed falling in with all these good things. Of course, we had to face the fact that motor cyclist despatch riding is dangerous work, but for the matter of that all volunteer work at the front is dangerous, and on comparing our lot with that of the infantry volunteer we could not help feeling that fate had been indeed kind. To a certain extent we owed our position to promptness of action, since we did not delay a moment after seeing the letter in the first instance.

The next day was Sunday. However, it made little or no difference to our routine. We paraded at nine o'clock and had some infantry drill, followed by a lecture on scouting. Several men went on fatigue duty, bringing up machines from the station and unpacking crates. And during all this time recruits kept pouring in, most of them being university and club men, and men from the various officers' training corps.

We had a big parade late on Sunday evening, when every man was allotted to a definite company. My friend and I were allotted to the second signal company at Aldershot, and were directed to proceed thither as soon as we were able. Thus we lost little time in getting our marching orders.

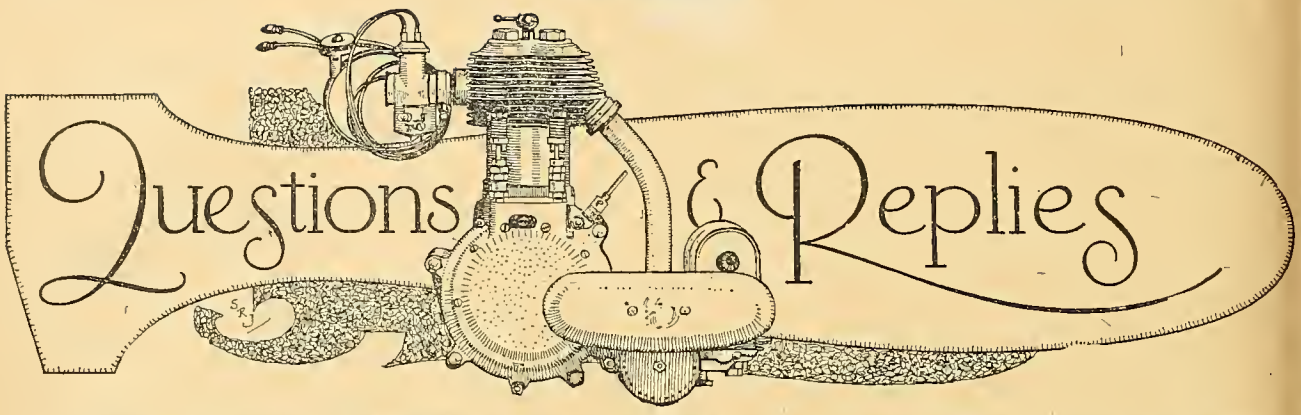
I get my Machine.

Then came Monday. We paraded at 7.30 on Monday morning, and along with others we were sent on fatigue duty, which consisted of unpacking the crates and fitting up the new machines. We set to work with zest smashing up crates and extracting brand new machines, which came forth glittering and shining, masterpieces of modern mechanism From other boxes came hordes of lamps, horns, mirrors, spare tubes, spare belts, spare tube carriers, etc., etc., etc., and it was our job after unpacking to fit each machine up with these. My friend and I, seeing our advantage, each picked out a machine which we intended, if in any way possible, to secure for ourselves, and we set to work fitting these up. To a man who has never been able to afford a new machine you can imagine that this sort of thing would be like a dream, and we both hoped we should not suddenly "wake up." Later on in the day we had an opportunity of allotting the mounts we had chosen to ourselves definitely.

Off to all Points of the Compass.

Chatham had been used merely as a recruiting centre for the special reserve of motor cyclists. In all cases, when a man was completely equipped and provided with a machine, he was attached to some definite company, possibly hundreds of miles from Chatham.

Some men were sent to Stirling, others to Limerick. We were both sent to the same company at Aldershot, and so started off for the great military centre that evening on our new mounts, full of zest for our new life.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Driving Query.

I have a 1914 two-speed two-stroke. Is it correct to run the engine when the gears are in the neutral position, and on descending a steep hill should the throttle lever be shut off, the air full open, and the exhaust lifter raised, or what should be done?—BEGINNER.

There is absolutely no harm whatsoever in running the engine with the gears in a neutral position. It is not good to run the engine like this too much, as it, of course, would soon heat up to a considerable degree, and the engine should not be raced when not under load. In descending a hill it is usual to leave the air lever in its normal position and to close the throttle and raise the exhaust lifter, but opening the air wide when going down a long hill is quite advantageous from every point of view.

To Improve Petrol Consumption.

I have a 1912 3½ h.p. single-cylinder machine with fixed engine. I ride with a gear of 5 to 1. I have thoroughly cleaned the engine, carburetter, etc., and the machine runs splendidly and roars up the Derbyshire hills. I cannot get more than 70-80 m.p.g. although I drive carefully, with the magneto fully advanced, at about an average of 25 m.p.h. The jet is a 30; the carburetter does not flood, and I consider I ought to get more miles per gallon. To average 25 m.p.h. the throttle is about a quarter open and slightly in advance of air lever. Is this about right?—E.P.B.W.

You might try a smaller jet or lowering the petrol level. On a machine such as you are riding the petrol consumption ought to be about 90 m.p.g., or even more. Of course, it is absolutely essential that the engine is clean and that compression is good. The gear ratio you are adopting is about the best that could be used for a machine of this type. Also see that the inlet pipe unions are quite air-tight and that the valves are really closing. Probably the fitment of a pipe a few inches long to the air inlet of the carburetter would improve the consumption by minimising waste through possible blow back.

Misfiring at Slow Speeds.

I have a 3½ b.p. single-cylinder machine. Can you give me the reason why it misfires at low speeds? I have tried a B. and B. carburetter, also a Senspray, but when running at 8 to 12 m.p.h. it keeps misfiring, but when going at a faster pace it runs perfectly, as is also the case when the carburetter is first flooded for a hundred yards or so, but after that distance it starts misfiring again.—F.M.

The trouble is doubless due to air leakage in the inlet pipe, and we should advise you to test the carburetter union as well as the cylinder union. A good cure for such leaks is ordinary electricians' tape, which if bound round tightly will hold for some considerable time. The reason the engine misfires at low speeds but not at high is because the extra air admitted through the leaks upsets the weak mixture at slow speeds, but is absorbed when the throttle is open.

Machine for Long Cross Country Work.

I occasionally want to make a ninety-seven-mile cross-country journey; the train takes a little over four hours and the times are inconvenient. I shall be glad to know if one of the 2 h.p. two-speed lightweight machines on the market would do the journey in four to four and a half hours? The roads are good main roads, and, with the exception of four or five miles up the Malverns there is nothing particular in the way of hills.—J.B.P.

We do not think it possible for you to complete a ninety-seven-mile journey such as you mention in four and a half hours on such a machine. It is not a very easy matter to average 24 to 25 m.p.h. on any machine, because it means pushing along in parts at speeds of 35 to 39 m.p.h. We should advise you to allow yourself five hours for the journey and use a variable geared machine of not less than 2¾ h.p. The very light low-powered machines are admirable for short journeys, but a larger and more powerful machine is to be recommended for frequent long journeys at legal limit speed such as you wish to undertake, and they are far more comfortable.

Sluggish Running and Knocking.

I should be very pleased if you could help me with the following difficulty I have with my machine. It is a 3½ h.p. 1914 model, single-cylinder, with fixed gear, and the engine knocks at the slightest provocation The knock when accelerating quickly I can, by careful driving, stop, but the trouble is on hills. When more power is wanted I find that, instead of being able to open both throttle and extra air, I can only open the gas and have to shut the air to stop the knocking, and, consequently, only a part of the engine power is developed. The timing of the magneto is exactly as the makers advise, as also is the gearing; the machine has not been touched since it left the works when new, except for cleaning the cylinder. I have tried retarding the spark, but this only causes loss of power, and the engine is then inclined to get warm.—W.G.K.

It is quite possible that the trouble you complain of can be eliminated by changing the plug. If the points of the plug have burned away to such a degree that they become incandescent when the engine is firing, violent pre-ignition would take place and cause knocking. On the other hand, it might be that the bearing of the big end or small end has gone and that rebushing is necessary. Also a slack piston would give you the same trouble. These are, of course, suggestions, because the data you give us is rather meagre, but they are the points to be carefully checked as a start in the search for the trouble.

Heating of Crank Case.

The crank case on the 6 h.p. twin-cylinder engine of my side-car outfit gets hot. By that I mean that it becomes sufficiently hot to render it unpleasant to keep one's hands on it. Is this anything to worry about?—A.J.S.

Heating of the crank case can only take place from two causes, namely, through blowing back of the charge past the piston rings and through conduction. The former, of course, is due to a worn piston or worn rings, and can easily be rectified, but if you have taken the precaution to see to this we should say that

the crank case overheats purely and simply through conduction. Overheating by conduction is caused by overheating in the cylinder. We should therefore think that the carburetter setting is not adjusted correctly, and that you are running on either too rich or too weak a mixture. Probably, if you will check this carefully you will find this to be the case, and when altered will not suffer very much from the overheating you complain of. So long as the crank case does not overheat to such a degree as to burn the oil from the bearings there is absolutely nothing to fear, and if the engine is running and pulling well we should advise you not to trouble about it in any way.

Tuning up an Engine.

I have purchased a good second-hand motor cycle of 2¾ h.p., single-speed, 1910 model. I have taken out all the parts separately from the frame except the crank case, which I did not wish to take off or open for fear I could not put it together again after cleaning. All other parts were very dirty and were cleaned, oiled, and are now in good condition. I am satisfied that I have made a fairly good job of the two cylinders by cleaning, but there was not much deposit, and I am informed the valves were ground within the past two years. The machine ran badly just before taking it to pieces. I took it to a workshop mechanic and he said that there was no oil in the tank, though the glass tube indicated a depth of an inch at the time. However, after putting in oil and looking at the carburetter, etc., he satisfied himself that it was in first-class condition, only that he somewhat feared that there was a leak in the crank case. It went fairly well for the next fifteen miles, though the speed would not exceed about twenty-five miles an hour, and it would fail to get over hills, and, after twenty miles or so, it would almost stop on the smallest gradient, but not for want of oil or petrol. It takes a gallon of petrol to travel only thirty miles, and it does not take much extra air. Would it be wise for me to open the crank case and clean it? I should be glad of your general advice. —W.M.

In reply to your question you do not say whether the engine is suffering from lack of compression. If this is the case it will be extremely difficult to get anything like the maximum power. You also complain that when running some distance the engine gradually comes to a standstill; this is probably due to the fact that the valves are not adjusted correctly and when hot expand down on to the tappet and, therefore, do not close. It would also seem that you are using much too large a jet in the carburetter, and we would advise you to try one very much smaller. Again, it is absolutely necessary that there are no air leaks in the inlet pipe. Consequently observe the union carefully and see whether such is the case. We do not think you would have any difficulty in taking down the crank case, and it would probably be better for you to do so and clean it out thoroughly. At the same time you would find it a help to get the advice of an expert, who would tell you whether wear had taken place on the cams and timing wheels.

A Tour in the Highlands.

Will you very kindly give me an idea for a week's motor cycle tour in Scotland, starting from Edinburgh? I have a 6½ h.p. single-geared machine.—A.E.R.

In the first place, a single-geared machine is not suitable for touring in the prettiest parts of Scotland, where the roads are narrow and the gradients are steep. We do not make a habit of working out tours, but as the Touring Departments of the motoring organisations are likely to be rather disorganised for the present, we would suggest the following: Edinburgh, Granton, Berry to Burntisland, Kinross, Perth, Dunkeld, Pitlochry, Blair Atholl, Dalwhinnie. It is almost worth while staying here a day for the purpose of exploring the country round Loch Ericht. Continue through Kingussie, Carrbridge, Beauly, Dingwall, Alness, over the hills to Bonar Bridge, Lairg, and Scourie. If you want some really wild scenery there are plenty of hilly rough roads. Then go on to Unapool, Ullapool, Strathpeffer, and back to Inverness. Then go along the shores of Loch Ness, etc., along the Caledonian Canal to Fort William, taking the ferry to Ballachulish, go to Tyndrum, go through Kilnember, Kilmemfort, along the eastern shores of Loch Awe, Dalmally, Tyndrum, Killin Junction, Lochcarnhead, Loch Lubnaig, Callendar, Stirling, Falkirk, Linlithgow, and back to Edinburgh.

Quick Starting Wanted.

I have a new 4 h.p. Triumph with sidecar. Can you throw any light on the reason of the following difficulty? Starting with a running mount with any gear in and the clutch engaged, after dropping the exhaust lifter the machine runs, say, six paces without firing and without the compression pulling it up, but after the six paces or so, keeping on the run, the machine will then fire all right and run beautifully. Why is this? The compression is perfect, valves lifting all right and seating all right. The clearance between exhaust valve and tappet is kept small purposely, but still there is a clearance all right, and, remember, the engine is cold on starting.—W.A.C. (QUETTA, N.W.P.)

The slight difficulty in very prompt starting of the motor is probably simply one of control lever position. Your machine is fitted with an admirable half-compression device by means of which the engine should start almost instantly at a walk on low or middle gear. If you have not already done so, try closing the air lever till the engine fires, and then open it up to the proper running position. Directly the engine fires and you are in the saddle, kick the half-compression lever out of action.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected matter will only be returned provided a stamped addressed envelope is enclosed for the purpose.

READERS' REPLIES.

Rust on Exhaust Pipes.

With regard to the enquiry by "B.E.E." for a preparation to keep rust from exhaust pipes, I believe many owners of conservatories and hot-houses paint their hot water pipes with a mixture obtained by boiling linseed oil and lamp black. I do not know the exact proportions, but I can find out if "B.E.E." thinks it worth trying.—ARTHUR PHILPOT.

A Mysterious Complaint.

I notice on page 286 in *The Motor Cycle* of August 27th there is a query relating to trouble with a horizontal twin 500 c.c. I believe the whole trouble of your correspondent is traceable to the magneto—the last thing in the world one would expect. Here are my reasons: I have a 5-6 h.p. F.N., 1912 pattern, which developed the same symptoms and would not go for more than a few miles without stopping; it, however, got down to about two hundred yards in the end, when I spent about two weeks on and off overhauling everything, but the same game went on, so I decided to take the magneto right off and get at the inside (previously I had cleaned the contacts, etc., and carbon brushes). I found the trouble, viz., water in the armature tunnel caused by the magneto being near the hot engine; the water was caused by condensation of air on the magnets, very much in the manner that an induction pipe "sweats." The "beads" of moisture collected at the bottom of the magneto, and the revolving armature churned them up and they settled across the tunnel, causing loss of current and a weak spark. The reason that the machine started easily was that the water drained to the bottom when the machine was stopped, and, of course, got gradually churned up again in a few miles. I cleaned as much as possible away with a rag, and got rid of the rest by placing the magneto in the gas oven, having previously heated the oven and turned the gas out. This steamed the moisture out quite satisfactorily, and the engine goes better than ever. The power after replacing the magneto was a revelation. The F.N. magneto is fixed on the crank case, and, consequently, gets warmed up to the crank case temperature. On a horizontal twin it is also fixed to the crank case, and the heat tends to dissipate itself through the magneto, and the cold air against the magneto causes the heat to condense.—W.B.

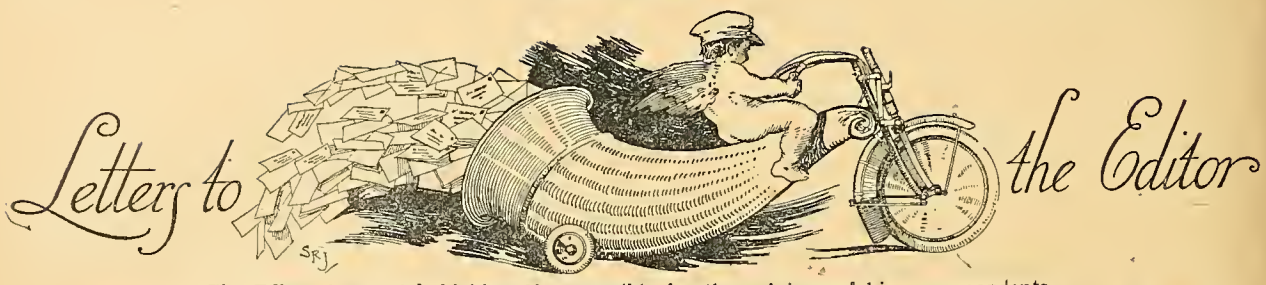
EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"P.L.K." (Durham).—6 h.p. Excelsior. Petrol consumption, power, and absence of vibration.

"J.T." (Newport).—G.N. and Grand Prix Morgan. Hill-climbing, reliability, and comfort.

"J.A.P.R." (Somerset).—2¼ h.p. New Hudson. Reliability, ease of control, petrol consumption, average speed, and hill-climbing powers.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Cutting Down Running Costs.

Sir,—In connection with your recent article on this subject I am sending you my expenses incurred in running 20,000 miles on a 1913 three-speed Triumph.

The figures show how economical a good modern machine is.

	£	s.	d.
Licence, etc.	1	5	0
Refits	12	1	1
Fuel	15	11	2
Lubricating oil	1	17	6
Cycle oil		7	4½
Tyres	14	12	0
Belts	3	4	10
Carbide		4	0
Depreciation	25	0	0
Total	£74	2	11½

or roughly .89d. per mile.

I do not insure against accidents, and what I spend on motor clothing is saved in shoe leather.

Under the heading "Refits" are included costs of all spare parts, new lamp, horn, repairs to three-speed gear and speedometer, and two complete overhauls by the Triumph Cycle Co.

Fuel.—Consisted of 200½ gallons of benzole.

Tyres.—Clincher 2⅜in., which lasted on an average 8,000 miles on the front wheel, and 4,600 miles on the back wheel.

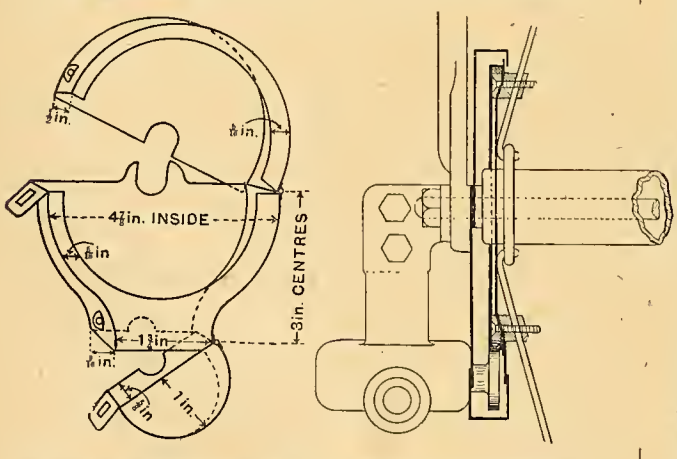
Belts.—Dunlop 1in.; average 6,100 miles per belt.

£25 should cover the depreciation, as the machine has just been thoroughly overhauled and is in perfect order.

I hope to run another 20,000 miles on the machine at a still lower cost. A. W. TOMLINSON, R.N.

A Speedometer Drive Cover.

Sir,—I noticed in a recent issue an illustration of a speedometer drive gear cover. It may interest you to know that about twelve months ago I fixed up a similar arrangement for my Watford speedometer drive. I am enclosing a couple of rough sketches which, I think, are fairly self-explanatory.



The case is made of stout tin plate which will not buckle.

I may say that I had it fitted all through last winter with every satisfaction. The oil I use is a fairly stiff mixture of paraffin candle and vaseline.

In conclusion, I might add that if there is a tolerably good fit between the disc covering the spokes and the inside rim of the case, little water or grit is likely to enter.

J. WARING

How to Avoid Petrol Overcharge.

Sir,—Perhaps by this time the dealers in petrol may have reconsidered matters, but in case any of your readers may drop across one of these gentry who demand some ridiculous price for petrol, might I recommend a useful tip which I myself carried into operation a few days ago at Rugeley?

That was, to threaten to report the vendor to the Motor Traders' Association. This had the desired effect, and scared the gentleman so much that he nearly thrust a tin on me—free—in order to get rid of me!

In this case four shillings per gallon was being asked.

To anyone who is being bluffed in this way, the letters "M.T.A." act as a charm. I hope someone may benefit by using those letters. CE 1942.

The Remuneration of Military Motor Cyclists.

Sir,—As there appears to be a somewhat mistaken idea as to the remuneration of motor cyclists serving with His Majesty's Forces, I should like to draw your readers' attention to the actual facts.

When I joined the 7th Batt. Devon Reg. Territorial Forces I had to sign on for the usual period—four years—and I was then given to understand that I must provide a suitable machine with spare parts—the spares costing £11. I was to receive a bounty of £5 on joining and 11s. per day, made up as follows: 8s. per day on which to run the machine, 2s. per day mess allowance, and 1s. per day pay. I was quite prepared to serve under those conditions, believing it possible to run my machine and maintain it in good order for less than the allowance of 8s. per day, and so augment the actual pay of 1s. per day I quite recognised that 1s. per day was no adequate remuneration to offer a skilled man, for a motor cyclist must be such a man. Since signing on I find that I receive no bounty, as I had not joined before the Mobilisation Order was issued. The order was issued the day before I joined. Several of my friends who joined the day before I did have received the bounty. Further, the War Office have taken over and paid for all our machines and spares, deducting ten per cent. per annum from the first cost. This comes rather hard on some of us, as several of the machines were less than a month old, and the spare parts as specified by the War Office had to be purchased especially for this business.

Motor cyclists enlisting with the Regulars for the period of the war only need not provide a machine—the War Office will do that for them. They receive £10 bounty on joining, pay at the rate of 5s. per day, all expenses, and £5 bounty on leaving.

We motor cyclists in the Territorial Forces have to do all that those attached to the Regulars do, but for a considerably smaller sum. Further, we must serve during the war as the others do, and afterwards must complete our term of service. We motor cyclists of the 7th Batt. Devon Reg. have been asked to volunteer for foreign service, but only at our present rate of pay, 1s. per day. This most absurd difference between the two rates of pay was not made known to us until after we had been serving for some time. We have no apparent remedy. But I should like to warn others who are thinking of joining as motor cyclists attached to the Territorial Forces that they will only receive 1s. per day.

We do not wish to make money in a crisis like the present, but our present rate of pay hardly seems to us an adequate remuneration for men who have had to leave their business. Why should we not have the same as others, when we do the same work? JOHN GIBSON,
Motor Cyclist of 7th Batt. Devon Reg.

No Dearth of Magnetos.

Sir,—I have read with interest your article and letters under the above heading, and in view of the conditions now existing between this country and Germany, suggest it is not a time to be lamenting a possible shortage of German-made magetos. Manufacturers of motor cycles and cars have not hitherto encouraged British firms to manufacture magnetos, but let them do so now, and the motoring world will not regret it. Surely there can be no serious intention of buying the German magnetos, which "during the present crisis" (to quote from one of the letters) are to be made in the U.S.A. and financed with German capital? Shall we in this country strive to keep these firms alive until the tide is turned? I think not.

A few years ago an enterprising British firm realised that this country was practically dependent on Germany for carbons for searchlights, arc lamps, picture theatre lanterns, etc., and so erected carbon works in the Midlands. Up to the present time it has lost £70,000 because it could not compete with German prices. What is the result to-day? This Midland factory is working night and day to meet the demands of the Admiralty, War Office, and a fraction of the orders for street lighting carbons and arc lamps generally.

The shares are not now to be bought. So let it be with our magnetos.

If we must copy, German patents in this country are open to all. MADE IN ENGLAND.

Lady Riders in South Africa.

Sir,—As a reader of your paper, I notice from time to time photographs of lady motor cyclists. Enclosed you will find a photograph of a lady friend of mine (Miss Hilda Arnholz) who is a keen motorist, and is the first and only lady motorist in this part of the country who holds a licence to drive a motor cycle under the new ordinance. The machine is a 1914 3¾ h.p. Elswick three-speed, S.A. gear, and free engine, with sidecar attached. R. BENNETT.
Port Elizabeth, S. Africa.

Miss Hilda Arnholz, the first lady motor cyclist in Port Elizabeth, South Africa, on her 3¾ h.p. three-speed Elswick sidecar.

Competitions and the Crisis.

Sir,—We note that hill-climbs, etc., are still being held notwithstanding the present grave state of affairs, which necessitate the employment of every able-bodied man on national work. The competition rider is surely the very type of man that the country needs, and as reliability trials, hill-climbs, etc., such as were recently held under the auspices of the Coventry and Warwickshire Motor Club, can only be regarded as "business as usual," we fail to see that employment is thereby helped. These competitions can only be regarded with disfavour by the general public, who would willingly support any form of useful endeavour which necessitates employment. No one can say that motor competitions give any extra employment sufficient to justify the bad effect produced. I. B. HART-DAVIES.
J. R. HASWELL.

[We deal with the subject of Sport and the Crisis in a leaderette this week.—ED.]

An Overseas Specification.

Sir,—Allow me through the columns of your most valued paper to give an idea of what would answer the purpose on South African roads, especially when in a boggy state: Engine not less than 3½ h.p., 84 × 90 bore and stroke, single-cylinder, air-cooled, chain drive (if twins, to be vertical, side by side), three or four speeds, free engine, counter-shaft, semi-automatic carburetter controlled from handle-bars, levers to open away from machine (in case of a cropper this would stop engine racing), frame about twenty-four inches, engine crank case clearance not less than seven inches, forced lubrication from foot pump to bearings, front forks sprung after Triumph style, no front brake, back brake to be twin blocks acting on dummy belt drum controlled from left footboard, kick starter, tank capacity two and a half gallons, oil two pints, clearance between inflated tyre and forks not less than 1⅝in., water-tight magneto placed high up, mudguards to be extra wide, wheels 28in. with 3in. tyres, a more rigid type of petrol feed cock, as old style gets scored with continuous use, hence continual leakage, and lastly, "all-black" machine.
Rhodesia, S.A. ALEX. T. SCOTT.

Prices in Australia.

Sir,—I notice in your observations in the Overseas Supplement, May 7th, you mention the fact of a writer in India complaining about the price of accessories. I wish to bring under your notice that the same condition of things applies to Melbourne also; not only in accessories, but motor cycles as well. I think it very unfair that an agent should charge £75 10s. for a T.T. Douglas and £45 for a Calthorpe Junior retailed in England at £48 and 25 guineas respectively. I might mention that the Rover agent finds it profitable to sell the Rover cycle (English price £48) for £61 10s. Why the difference in price in case of the Douglas? The Triumph, Rudge, and other well-known makes (English price £48) sell at £67 10s. I am riding a 2¼ h.p. lightweight at present, but I am looking forward to the time when a Douglas will be sold at a reasonable price.

I certainly think that manufacturers should limit the price of the machines in the Colonies, of course taking the different tariffs, freights, etc., into consideration. I might state that if the English manufacturers allow these conditions to continue they will lose a great amount of trade, as American machines are being sold here very cheaply, although there is a preferential tariff for British-made goods. MELBOURNIAN.
Melbourne, Victoria.

SUMMARY OF CORRESPONDENCE.

We are glad to be able to state that Mrs. Foster Avery and her daughter, whose portrait on their Harley-Davidson sidecar we published on page 296 of the issue 3rd September, as missing in the war zone, are now safe. We have heard from Messrs. Alsford and Tebbutt, motor cycle agents, Southampton, that the two ladies are now on their way back to Philadelphia, and that their machine is being sent back after them. We congratulate the ladies on their escape to more peaceful climes, and also on their good luck in being able to retain their sidecar outfit.

OCCASIONAL COMMENTS
by "IXION"

Comfortable Touring Again.

I have covered a thousand miles in the last fortnight over roads crossing a dozen counties. I was stopped but once, at Aylesbury, where the police were inspecting all driving licences. Petrol was obtainable at practically normal prices in the most remote townlets, and even at night I met no sentries. In other words, touring is quite as safe and comfortable as in peace time, though a hot quest for a motor cycling spy or lunatic occasioned no little inconvenience on certain Midland roads for a day or two.

Rifle Shooting.

I have neither said nor implied that a marksman can be manufactured by putting a man with an air gun to practise solo at short range. Expert instruction is obviously essential to the scheme. But I can cap "Lieutenant's" experience, and perhaps modify the rather pessimistic tone of Mr. Brownrigg's able contribution, by reporting that I won the championship cup of rather a crack battalion on the very first occasion of manipulating a service rifle. Prior to this initial visit to the ranges, I had done a little revolver practice without tuition, and a couple of month's air gun practice under the tutelage of a crack civilian shot. Mr. Brownrigg is certainly wise in recommending the B.S.A. miniature rifle—a magnificent little piece. I mentioned air guns principally because they are cheap. But expert instruction is plainly essential in every difficult sport.

Broken Valve Rockers.

From year to year the most vulnerable detail of a motor cycle engine is eternally changing. For a long spell it was the exhaust valve which gave us the "needle." Now it is most certainly the valve rocker. I have scarcely encountered a case of a broken valve for the last eighteen months, but I have personally suffered three broken rockers, and my circle of acquaintance includes several men who have abandoned their pet makes of machine because of these tiresome fractures. I suspect the root cause is a silly little piece of false economy. I inspected a handful of smashed rockers last week, and they were all made of very low grade metal, which had slowly crystallised till it snapped. Some of these rockers are very long; they are pivoted at one extremity, and the other extremity has to raise a valve, perhaps 1,500 times a minute, against a pretty powerful spring. One does not hear of such weaknesses continuing from year to year in the machines of firms who comprehend the value of a laboratory. I remember that when I rode one of the first batch of the original Rudge machines, the factory experts were always grateful for the receipt of a broken part; a new part arrived free gratis by return post, and the faulty piece went straight to the laboratory, where the metallurgical aspects were carefully studied. That is the way to succeed.

Military Motor Cycles.

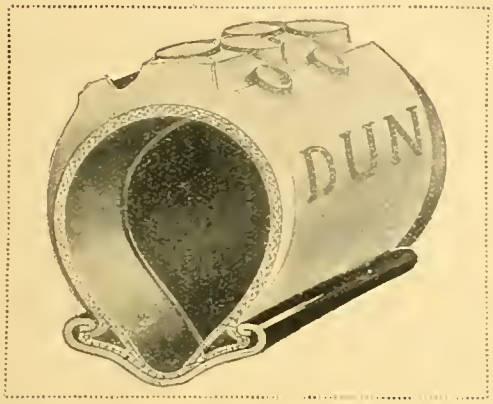
The choice of a machine for military purposes is certainly thorny. Experience leads one to put the highest value on reliability; it is as essential to efficient despatch riding as it might easily be to self-preservation. Second I should place light weight, and third a handle-bar clutch control. Our contributor, "Special Reserve," has emphasised the need of silence—likely to puzzle many volunteers. I should advise the disembowelling of the standard silencers, which may then be retained simply as expansion chambers; the outlet pipe should then be connected to one of the patented silencers, which should completely silence the exhaust, and the interposition of a cut-out between the expansion pot and the efficient silencer would enable full power to be obtained whenever silence was unnecessary. Surely he is in error in recommending an ordinary acetylene lamp; in my experience it is the cause of many petty troubles. Nothing would induce me to take on such work without my favourite cylinder of dissolved acetylene, which never chokes a burner, and provides twenty-four hours of continuous and absolutely reliable illumination with the standard burner. After all the essentials in lighting are reliability and cleanliness.

Oil in Small Quantities.

I suppose there are comparatively few motor cyclists who habitually cover very long distances without calling at home. If there were many of us, one would hear more about the expense of purchasing oil in small quantities. In my home shed I stock a large supply of oil bought in bulk at 3s. 3d. per gallon retail. On tour I have to replenish my tank at the rate of 1s. 6d. per quart, *i.e.*, 6s. per gallon; and as I am a bit of a road burner, and use a good deal of oil in a fast 200 mile spin, I find that oil constitutes no small item of my riding expenses. Passenger machines avoid this outlay, because it is easy to house a gallon can in a sidecar, or a couple of gallon cans on a cycle car; but the solo rider is hard hit whenever he rides for a week without visiting his home base. If I am riding a machine with footboards, I strap a quart can under the boards, but I have not yet employed any economy dodge on a machine equipped with footrests, as the back carrier is never too large to accommodate my personal luggage. I think I must buy a small torpedo tank to bolt on to the main tube. Five times last week I had to purchase oil at the rate of 6s. per gallon, and that drop of Jewish blood which is said to be responsible for the inherent greatness of every Britisher, much resented the impost. I wonder if the oil companies could reduce their terms a little if they imitated the petrol distributers and adopted returnable cans with substantial screw stoppers, guaranteeing purity by means of a wire and lead seal?

THE

DUNLOP



TYRE

A success of no ordinary character has been attained by the 1914 improved Dunlop motor-cycle tyre

Apart from its excellent structural design and its beautiful finish — points which every motor-cyclist can see for himself — this year's Dunlop tyre is the good thing it is because of its distinctive composition.

The special quality of rubber employed gives it a peculiar hard-wearing property, which is so exceptional that thousands of miles of work occasion only slight loss of rubber. Anyone who is driving on the improved Dunlops will corroborate this.

Write or ask your Agent for free Dunlop booklet, "All about Cycle and Motor Cycle Tyres."

IN TIME OF WAR. Dunlop motor-cycle tyres can be obtained with the same facility as before the war through the usual agents.

By buying British-made goods you help to support the industries and the workpeople of your own country.

THE DUNLOP RUBBER CO., LTD., *FOUNDERS OF THE PNEUMATIC TYRE INDUSTRY.*

Aston Cross, Birmingham; Alma Street, Coventry. Branches—London, Nottingham, Manchester, Newcastle, Bristol, Leeds, Liverpool, Glasgow, Dublin, Belfast.

DUNLOP SOLID TYRES FOR HEAVY COMMERCIAL VEHICLES.

In answering this advertisement it is desirable to mention "The Motor Cycle."

B3

QUADRANT

The mount supplied to the War Office—

the Quadrant 4½ h.p. solo — is identical in all essential details with the machine we offer you.

"There's no query about Quadrants" and the confidence of the War Office is further proof of that.

Distinguished by absolute reliability it is an ideal mount for "active service" and, under war conditions, will emerge from the severest tests triumphantly.

Note these details — **4½ h.p. Armstrong 3-speed Gear and Free Engine — Dunlop Tyres and Belt — Bosch Magneto — Senspray Carburetter — Quadrant Spring Forks —**

And these prices —

Solo 45 Gns.—Combination 55 Gns.

And then — let us send you descriptive folder.

QUADRANT WORKS, LAWLEY STREET, BIRMINGHAM. London Dept.—73, Gt. Queen Street, Kingsway.

"THERE'S NO QUERY ABOUT QUADRANTS."

CLUB NEWS.

Middlesbrough and District M.C.C.

Some fifty members have placed their services, as local despatch riders, at the disposal of the recruiting offices in the district.

Nottingham and District M.C.C.

At a specially convened meeting of the committee it was unanimously resolved that, owing to the war, the competitions for the Dennis Bailey and Campion Challenge Cups be held over for the time being, and, further, that the energies of the members, more especially those over recruiting age, be directed to the serving of the local recruiting officers and the Red Cross and distress committees. The offer of services has been accepted and members are being called upon for duty in connection with the above.

A HEAVY SIDECAR LOAD.

E. Hayes, of East Ham, who has now covered 2,000 miles on his 6 h.p. Sunbeam, the last 500 of which has been completed with a tandem sidecar, the outfit carrying six passengers

Dublin and District M.C.C.

A reliability trial was held on Saturday afternoon for the cup presented by the late Mr. F. J. Walker. The event took place over a circular course in Co. Wicklow, which was traversed twice, and as a margin of ten minutes per lap from the scheduled time was allowed without penalty, the result will probably depend on the flexibility test held on the long hill. In the restarting test on the Devil's Elbow, all the competitors succeeded in getting within the standard times fixed. In the flexibility test the best performances were as under :

	Slow.	Fast. Difference.
	m. s.	m. s.
A. W. Mooney (6 Bradbury sc.) ...	6 59 3/5	1 4 — 5 55 3/5
G. Roche (3½ Rover)	5 44 2/5	43 — 5 1 2/5
J. Doloman (3½ Rover)	3 7	47 — 2 20
R. H. Hurse (3½ Rover)	2 55	54 2/5 — 2 0 3/5
W. A. Campbell (3½ Rudge) ...	2 27 1/5	38 2/5 — 1 49 2/5
J. Browne (3½ Rover)	2 53	1 7 2/5 — 1 45 3/5
T. Toole (3½ Rover)	2 37 2/5	52 2/5 — 1 45

Leicester and District M.C.C.

The Leicester and District M.C.C. held its hill-climb on the 27th ult. at Beacon Hill, with the following results :

FORMULA.

TWO-STROKE MOTOR CYCLE, ETC., CLASS.

1. W. Williams (Triumph).
2. H. Bowerman (Velocette).
3. W. R. Hunt (Triumph).

LIGHTWEIGHT CLASS.

1. S. M. Gunn (2¾ Douglas)
2. R. King (2¾ Douglas).

BIG TWIN CLASS.

1. S. Briggs (5-6 Campion).

SIDECAR CLASS.

1. S. M Gunn (2¾ Douglas).
2. S. Briggs (5-6 Campion).
3. W. Chapman (A.J.S.)

T.T. CLASS (TIME ONLY).

1. C. H. Walter (3½ Rudge) ... ... 51 2/5s.
2. M. H. Simpson (3½ Rudge) ... ... 52s.
3. W. Lee (3½ Singer) ... ... 57s.

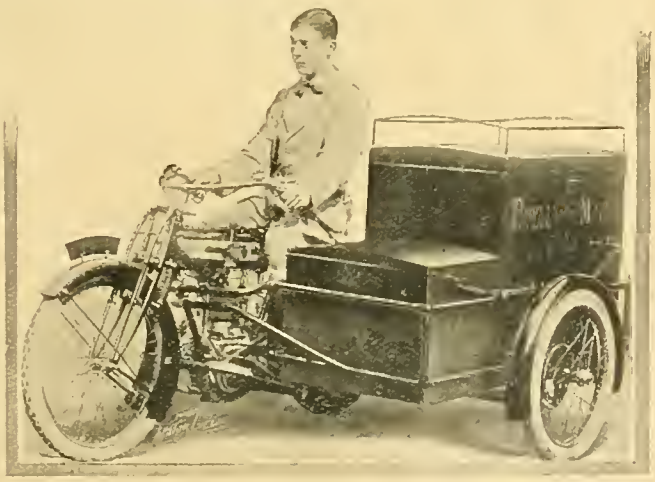
OPEN CLASS (ANY CAPACITY).

1. S. Briggs (8-10 Campion) ... ... 49 3/5s.
2. M. H. Simpson (3½ Rudge) ... ... 51 2/5s.
3. C. H. Walter (3½ Rudge) ... ... 52 1/5s.

After the events had been run off S. Briggs did an exhibition climb on his 8-10 h.p. Campion in 44 secs., a fine performance, closely approaching Lee Guinness's record at the Leicester Automobile Club climb over the same course.

THE 3½ h.p. ROVER SIDE CARRIER.

THE General Post Office is one of the largest users of sidecarriers, and we illustrate one of the latest 3½ h.p. three-speed Rovers supplied for carrying parcels and mails. Two of the particular features calling for notice in this outfit are the suspension of the load on the cradle chassis, and the well-known sidecar brake. There is no doubt that being able to brake both rear wheels on vehicles of this description is an important point, especially in a hilly country where heavy loads are being carried. The springing of the load is admirably carried out by means of long side springs shackled at the rear, the result being that the body rides without perceptible movement, either empty or when fully loaded. The importance of this will easily be realised when it is remembered that such a vehicle would be largely used for the delivery of small parcels frequently containing fragile material, and in many cases over the rough and stony roads and lanes of inaccessible rural districts.



Good springing is a feature of the Rover side carrier.

THE TRADESMEN'S SIDECARRIER.

Satisfactory Progress of the Commercial Sidecar. The Vehicle in Use.

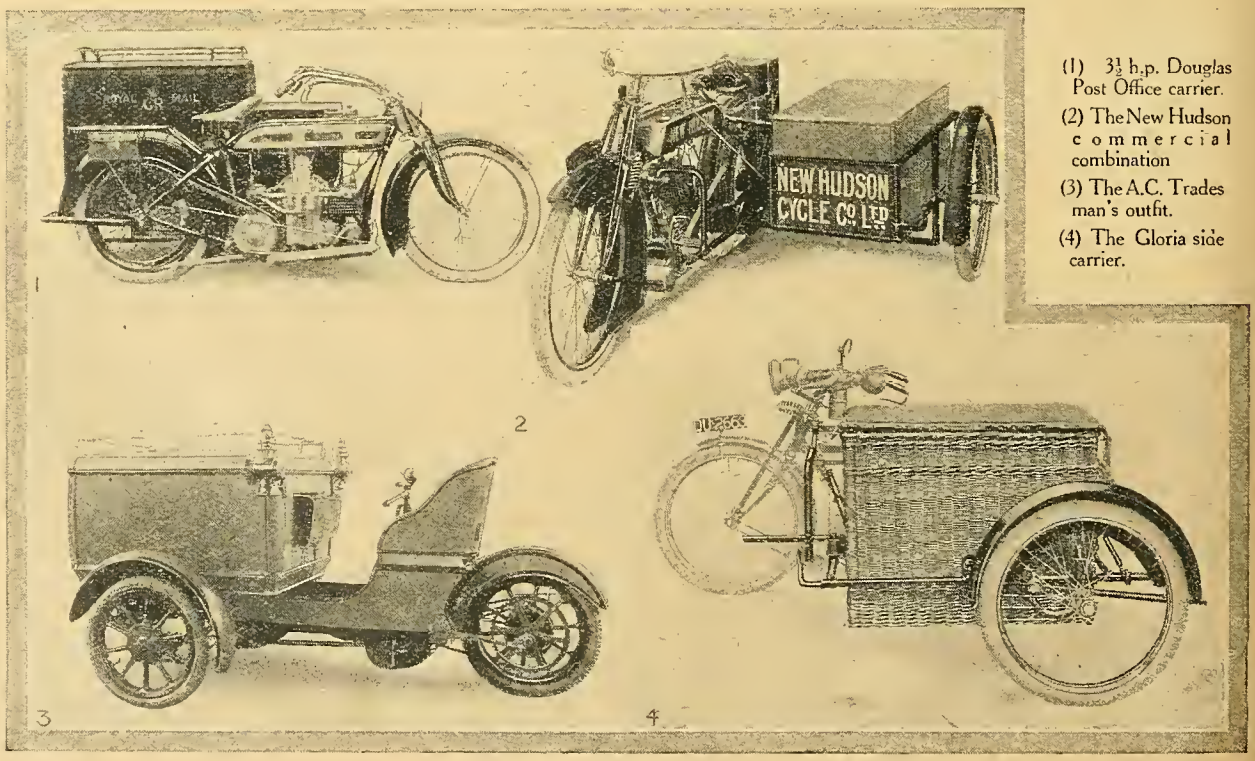
THE remarks in our issue of August 20th last on the utility of commercial sidecars, were evidently made at the right moment, for at once there has been increased activity in this field, and several makers are finding the sidecarrier a profitable line. As we have already pointed out, the fact of tradesmen being suddenly rendered horseless automatically created an opening for a mechanical means of transport, which should be light, low in cost, and cheap to run. In the sidecar these demands are fulfilled to the letter, and already the more enterprising tradesmen have adopted the sidecar vehicle, manufacturers in most cases being in a position to deliver promptly. Last week we noticed in London and the leading cities of the Midlands quite a number of these handy sidecarriers flitting about the crowded streets, nipping in and out of the traffic without any difficulty, and, of course, grappling with hills with ease. The low petrol and oil consumption of a good motor cycle are points strongly in its favour.

Sidecarriers in Actual Use.

For the benefit of tradesmen who may be thinking of taking up the sidecarrier we illustrate with this article a number of different examples of such vehicles in actual use on the road, from which it will be seen that there is no end to the many services into which they may be pressed. Though, of course, the carrier is particularly adapted to the conveyance of light goods over scattered areas, and consequently appeals most strongly to butchers, bakers, grocers, drapers, fishmongers, and the like, the carrier is used for many other purposes; even farmers and milkmen have found it a satisfactory means of conveyance, and it has become the rule for motor cycle manufacturers to use one or two of their own products for the conveyance of heavier goods, such as small castings, tyres, wheels, frames, and such like. Some of the last named machines we have seen propelling most abnormal loads. In running these machines the maker is killing two birds with one stone, for very often the vehicle used for this sort of work has a number of new departures embodied in its design which are undergoing test.

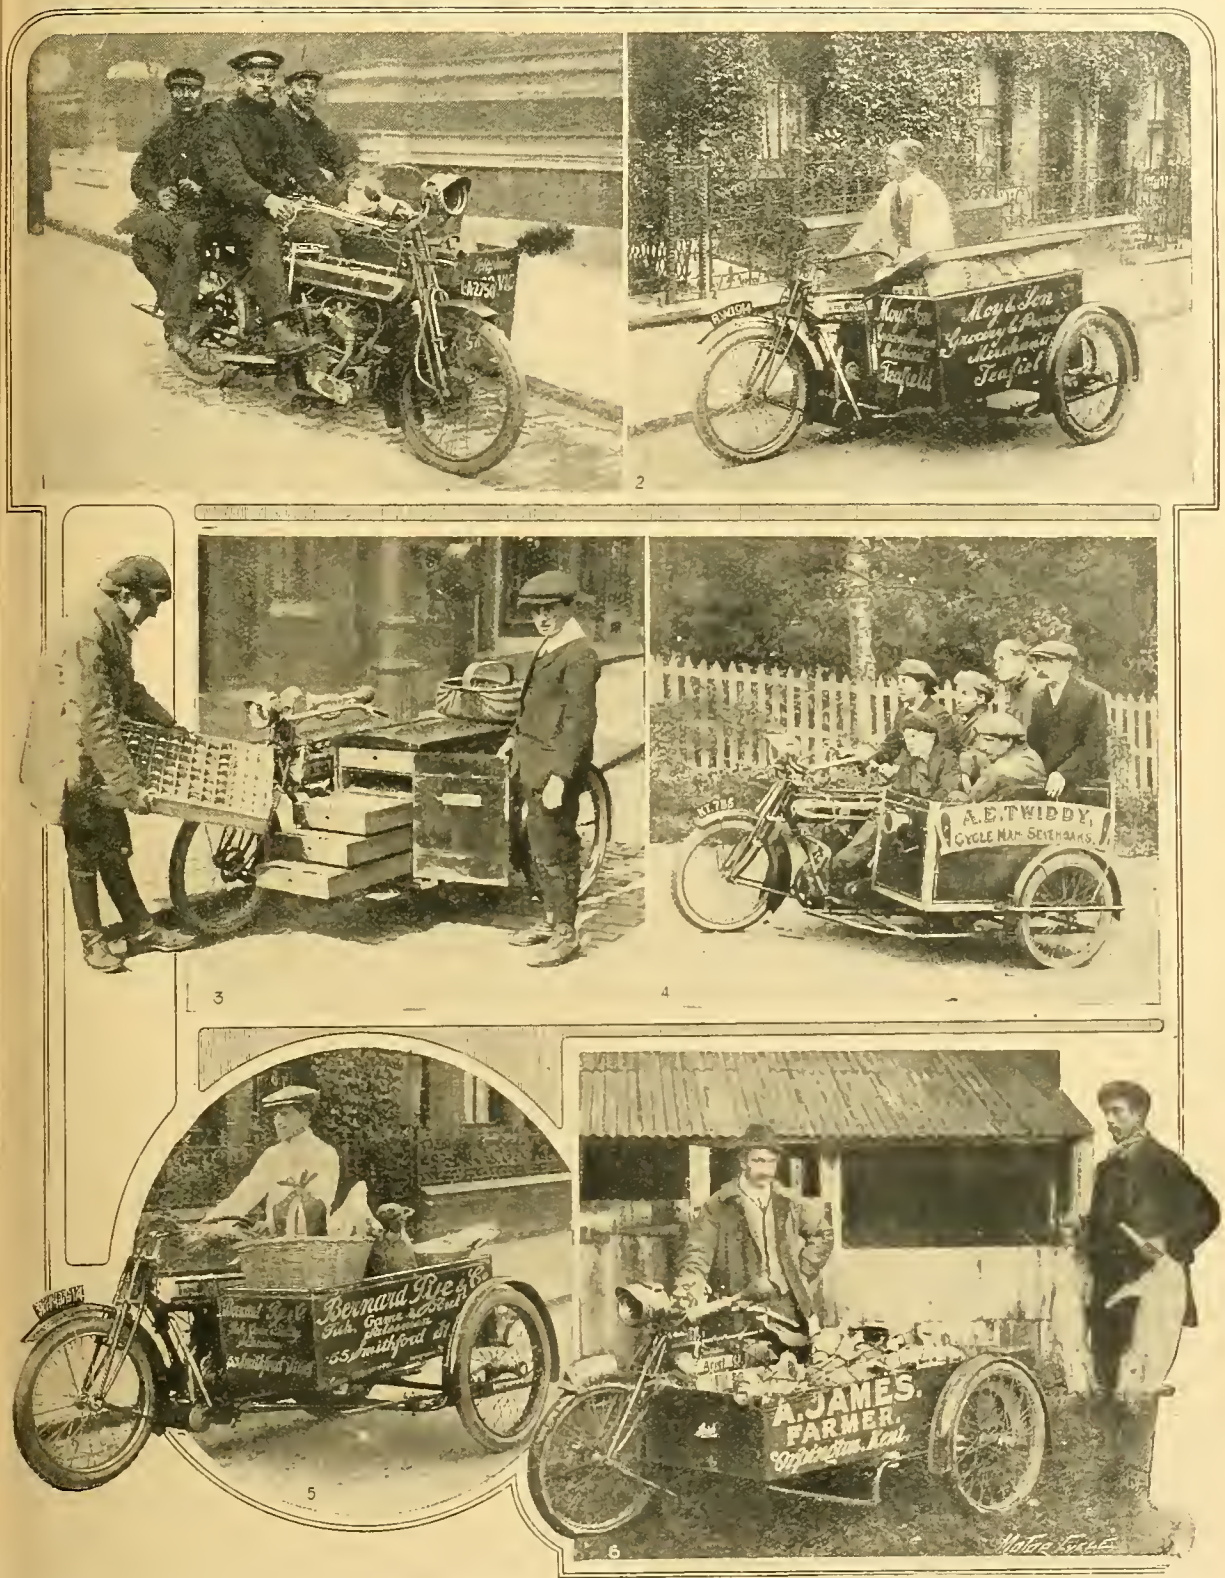
Notes on General Design.

A word as to the design of sidecarriers may not be out of place. Either single or twin-cylinder machines will be found to give every satisfaction, and the power should vary between 3½ h.p. and 6 h.p. A change-speed gear and a good clutch are absolute necessities, for in traffic it is necessary to stop and start frequently, and, besides, occasional stops have to be made in the middle of a hill. A low-compression engine is desirable, owing to the amount of engine running with the car stationary, which would become a nuisance in various ways with a high-compression motor. The low gear ratio should not be higher than 12 to 1, which gear with a good clutch will enable a standing start to be made on almost any gradient with a full load. The question of silence is, of paramount importance, in view of the fact that a tradesman's vehicle will be used mostly in traffic. The springing of the body will naturally depend upon the class of goods to be carried, and a tradesman in ordering should state clearly the weight of the average load he expects to carry.



(1) 3½ h.p. Douglas Post Office carrier.
(2) The New Hudson commercial combination
(3) The A.C. Tradesman's outfit.
(4) The Gloria side carrier.

Sidecarriers in Use Under Varying Conditions.



(1) A chimney sweeper who plies his trade by means of an 8 h.p. Chater-Lea sidecar.

(2) The grocer on his round with a 5-6 h.p. Rudge sidecarrier.

(3) Efficiency of springs on the modern sidecar is demonstrated by the fact that it may successfully be used for the conveyance of eggs.

(4) A motor cycle agent testing the climbing powers of his twin Premier sidecarrier on a Kentish hill.

(5) A game dealer with a Rudge. Expeditious delivery is the heart and soul of a tradesman's business.

(6) The farmer loading up his Ariel sidecarrier for the nearest market.

HOME FROM ANTWERP.

An Interesting Chat with a Motor Cyclist from the Beleaguered City.

LAST week we had the pleasure of a chat with a gentleman from Belgium, who had just come out of the war zone, and who was just going back into it. This was Mr. Leonard Frank Plugge, who is attached to the English Consulate at Antwerp. Mr. Plugge, though of Belgian extraction, is of English birth, and an English subject, being born in London, and is a student of Brussels University in the Section of Mines.

We met Mr. Plugge and his father at the Rudge-Whitworth works, where he was having his 5-6 h.p. Rudge-Multi tuned up to take back to Antwerp. Mr. Plugge informed us that there was no difficulty whatever in reaching Antwerp direct by sea at the present time, and, although he did not minimise in the least the deplorable ravages inflicted by the Germans in Belgium, he was entirely confident that the ultimate end of the war would be disastrous to our enemies, and stated that opinion on the Continent, as far as he could gather, was quite his way of thinking Both he and his father said that they feared the tales of German atrocities were only too true, but both spoke with confidence of the ability of Antwerp to withstand a heavy German attack.

Mr. L. F. Plugge, who is attached to the British Consulate at Antwerp, on his 5-6 h.p. Rudge-Multi sidecar.

Motor Cycles and Warfare.

We were informed that there were not many motor cycles in use by the Belgian Army, and that a large number might usefully have been employed in the earlier stages of the war, and our informant said that from news which he had gathered, motor cycles were playing an important part in the British operations, and were undoubtedly proving their worth and utility in every direction

Mr. Plugge came over from Belgium and landed in company with a party of Belgian refugees at Rochester, where, he said, they were most hospitably entertained by the civic authorities, but while they were fleeing from their country he was returning to Belgium, and said that he would be quite pleased to get back again.

Registration in Belgium.

Reference to the illustration will show the curious Belgian number plates, the numbers of which are about three or four times larger than those employed at home. Motor cycles in Belgium, we were informed, are numbered up to a thousand, after which they beg again with the letter "A" prefixed, and in due cour with the letter "B," though up to the present th have not got further than being in the second tho sand. Cars, on the contrary, have nothing but number, and no letter is ever employed, with the resu that some enormously long numbers are met wit running into five figures. Mr. Plugge told us that t F.N. works at Liège had been totally destroyed, ar corroborated the story of the heroic stand by fema employees at the F.N works at Herstal, suburb of Liège, detai of which we have alread given in *The Motor Cycl* He further added th he had no doubt wha ever that they gave th Germans a warm time as they were fully a capable of fighting as th men.

The Raiding Zeppelins

The Zeppelins, whic have raided Antwerp o one or two occasions an dropped bombs on th city, did not seem t have created much of a impression on our i formant's mind, and h described the bombs a extremely ineffectual causing more noise tha actual damage, and sai their effect was ver different from that of shell from a howitzer. The roads in Belgium generally, we were told, were now in a perfectl appalling condition, being absolutely broken up b the passage of troops and heavy lorries and guns The Germans had made enormous use of moto vehicles of all descriptions in their forced marche through Belgium, we were informed. By these mean they managed to convey their entire army, with al the attendant baggage and provision trains, at th wonderful average speed of nearly forty miles a day

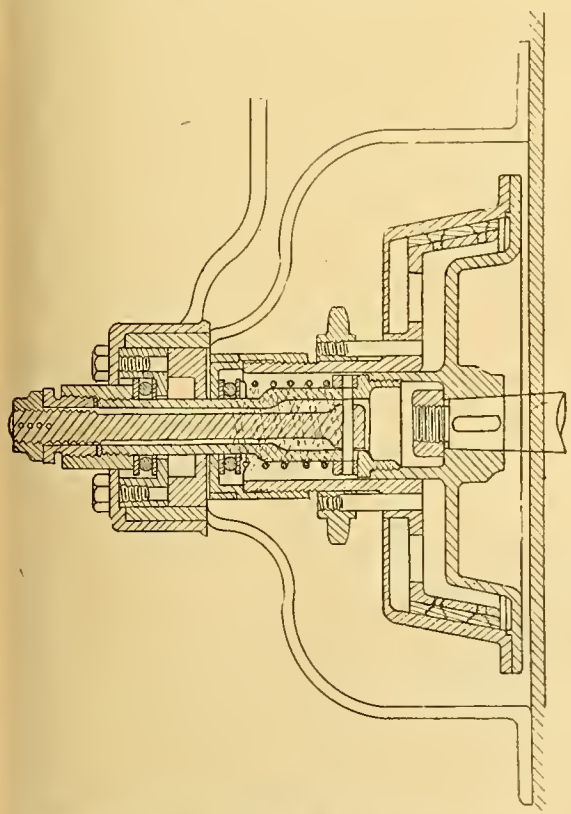
MOTOR CYCLISTS AS SOLDIERS.

PROBABLY no class of young man is mor eminently adapted for warfare than the averag motor cyclist. He is, in the main, young sound, and, by virtue of youth, generally free fron family responsibilities. We feel that, although muc has been done by motor cyclists to assist the Army more might yet be done. Most of these young me belong to a class with possessions worth defending Let them then defend them. The noble respons made by the working classes, who are not blessed wit much of this world's goods, should set a shinin example to these more fortunate young men.

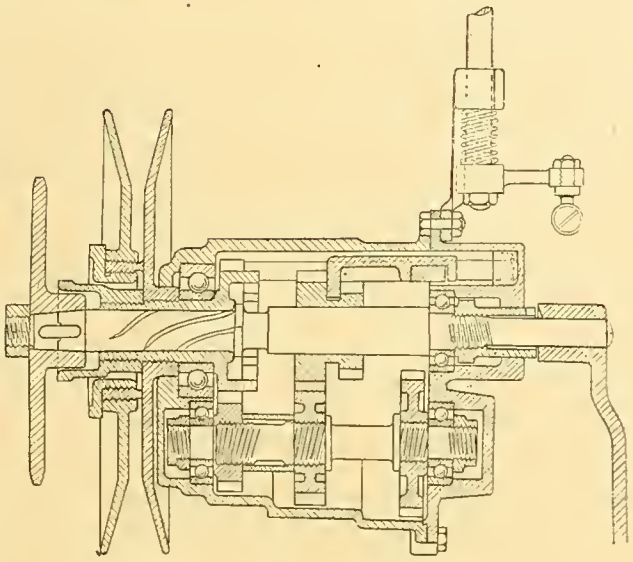
The Juckes Three-speed Countershaft Gear.

AMONG the many countershaft gears which have made their appearance on the market the Juckes two and three-speed gears, manufactured by the Efficient Motor and Engineering Co., Bilston Road, Wolverhampton, have much to recommend them to public favour. The three-speed gear is, perhaps, the most interesting type, and is constructed on car lines throughout and manufactured of excellent material and of strong though not unduly heavy parts. Both main and layshafts run on ball bearings, and the large diameter driving pulley is carried on the same side of the box as the chain wheel. The change of ratios is made by sliding a single member, consisting of two gear wheels, laterally along the main shaft, rotary movement of the sliding member being prevented by feathers on the shaft. The low and middle ratios are brought into use by the engagement of two pairs of gears, while top is engaged by dogs formed with the constant wheel and one gear of the sliding member. The box is clamped to the bottom bracket by bolts and a substantial top plate, and a sensible inspection plate is fitted to the side so that it is a simple matter to fill up the box with lubricant. The starting arrangements are entirely enclosed, and consequently free from grit and foreign matter.

The gear is intended for use in conjunction with a large leather-faced cone clutch fitted on the engine shaft, which is so lightly constructed that it causes no trouble to the engine bearings, while end thrust is



General arrangement sectional view of Juckes patent free engine clutch for three-speed gear box.



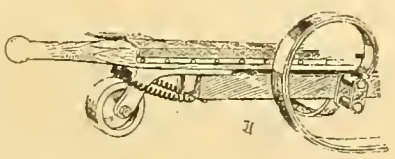
Sectional side view of Juckes patent free engine clutch

taken up by suitable means and does not in any way affect the engine. The clutch is entirely enclosed, and is supplied complete with the control pedal neatly mounted on it, and an additional attachment may be obtained by means of which it is easy to fit up a handle-bar control.

The two-speed gear is also soundly constructed, and both types have shown up well in open competition. We recently had an opportunity of examining the gear fitted to the latest pattern Wolf motor cycle at the Wulfruna Works, Wolverhampton. The gears are very neatly mounted and are a standard fitment to the machine.

ATTACHMENT OF SIDECAR AMBULANCE.

IT is important that the stretchers on sidecar ambulances should be attached in such a manner that there is no possibility of them working loose, and at the same time that a minimum of time and exertion should be occupied in removing them. To this end Messrs. Rudge-Whitworth, Ltd., have devised an exceedingly neat and safe attachment, which is shown in the accompanying sketch. The stretcher is fitted with four castors, to enable it to be easily slid on to a shelf in a large ambulance, and it is attached to the sidecar chassis by means of four spiral springs in the form of loops, which slip over the castor at each corner of the stretcher. This is absolutely secure, and at the same time it is only a matter of a second to push the spring down over the castor, the action of which facilitates such movement



Method of attaching Rudge ambulance to chassis.

THE AUTOMATIC CARBURETTER.

An Article in Praise of the One-lever Instrument.

THE development of the motor cycle in the matter of carburation has been slow, not so much from the point of view of efficiency, but from the point of view of the rider's convenience. It is an undeniable fact that the motor cycle carburetter as at present fitted to the modern machine is a very efficient article, both as regards power and economy. Motor cyclists, however, want more than these points. In fact, they could do with a little less of both, provided they could render their machines more flexible, more controllable, and more convenient to drive. These most desirable attributes are to be obtained at the expense of a very slight loss of power and possibly a slight increase in fuel consumption, but the advantages gained are so great that we are confident that the ordinary rider and the man who uses his mount for business purposes or in the service of his country will be prepared to sacrifice just a shade in ultra-efficiency. During the last two years we have tested a number of automatic carburetters, some good and some otherwise, but despite the failings of these we feel confident that the automatic carburetter is the motor cycle gas producer of the future, just as it is at the present time with the motor car. We do not pretend that the perfect carburetter is to be found even on the most expensive car, but we do affirm without hesitation that the car carburetter is very much nearer perfection than that on the motor cycle. It must be remembered that the automatic carburetter is not suitable for every type of motor cycle, as it can only be used when the "pull" on the carburetter is more or less continuous, a condition which does not obtain in the case of the single cylinder, is better in the case of the V twin, far better with the horizontally opposed twin, and ideal on the four-cylinder.

Advantages not Fully Realised.

Considering the number of multi-cylinder machines on the market at the present time it is rather astonishing that makers have not given the automatic carburetter closer attention, but on second thoughts it will be seen that the blame is to be placed on the actual user for not creating the demand, probably due to the fact that he has not yet realised its advantages. For the past two years the writer has specially gone out of his way to try the best forms of automatic carburetters with the idea of giving readers the benefit of different experiences. These have resulted in his coming to the conclusion that the good points in this type far exceed the bad ones, that the manufacturers have not given them a second thought because the non-automatic type can be supplied in quantities at a very low figure, and the motor cyclist has not yet learned the joys of a gas producer which, when the throttle is closed, does not stop the engine altogether, but lets it tick over at a very low number of revolutions.

Carburetters and Design.

It has not yet been realised that the automatic carburetter has a very important bearing on the design of the motor cycle. It is well within the bounds of possibility that the ultra-lightweight would never have attained the popularity it has if the automatic carburetter had come to the front earlier, as the demand for the small machine is the outcome not so much of the excessive weight of the 500 c.c., but of its lack of flexibility and controllability. It has been the besetting sin of designers to copy rivals too closely, to avoid originality, and not to take the car as a model.

Speed, not Flexibility, the Goal.

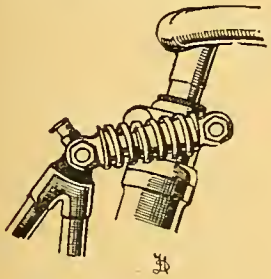
Too much attention has been given to making the machine attain the maximum amount of speed, while the desirable attribute of being able to travel slowly on top gear has been very largely neglected. Those who have had machines which would not slow down nicely in traffic or on greasy roads can fully appreciate these remarks, and many as a last resource have got rid of their high-powered mounts. The amount of efficiency lost with an automatic carburetter is very slight; how little can be gathered from the fact that we climbed the worst hills in the recent A.C.U. Six Days Trials on a 3½ h.p. twin fitted with a carburetter which is to be found on the best cars sold in the United Kingdom, while the consumption was by no means excessive. The benefits which the more modern type of carburetter offer are to be appreciated not only by the inhabitant of the large town but also by the military motor cyclist, who has to pass large bodies of troops on the march at slow speed. In conclusion, it is sufficent to say that the automatic carburetter has arrived, and it bnt remains for the purchaser to ask for it, for the manufacturer to pay attention to his demands, and to fit it as a standard.

Members of the motor cycle section of the 10th Royal Scots Territorial Cyclist Battalion, whose headquarters are at Linlithgow. The photograph was taken in camp, in Ayrshire, just before mobilising for active service.

AMONG THE ACCESSORIES.

Terry's Spring Links.

SOME months ago we received from Messrs. Herbert Terry and Sons, Ltd., of Redditch, a pair of their spring links for trial purposes. These were immediately attached to the forks of a two-stroke lightweight, which has been in daily use ever since. The machine has been ridden over every kind of road, including some of the most



Terry's spring link.

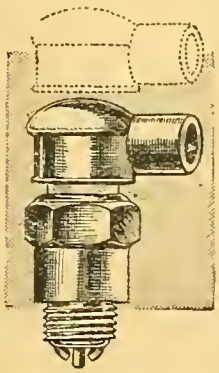
severe trial routes, so that the springs may safely be said to have undergone a thorough test. In every way they have proved a success. The fork springs, which were on the light side, used to cause an unpleasant jar when a bad pot-hole was encountered, and this shock has been quite eliminated, besides many other minor but unpleasant road shocks. It has often been suggested to us that side play would develop in the telescopic joints, but after nearly 4,000 miles hard road use we can truthfully state that there is no perceptible difference from the original state. It is most interesting to watch the action of the springs over rough ground, and one can see at a glance the amount of shock one is saved by the addition of this simple little accessory.

We append a photograph of a pair of springs which in all probability saved their owner's life, for he charged into a horse and cart which was standing on a sharp bend and was seen too late to avoid a collision. It will be noticed that the links have been torn ont of their sockets, and the gradual stretch of the springs greatly minimised the force of the concussion.

A pair of Terry links which emerged, as shown, from a severe impact.

A Well Protected Plug.

The accompanying illustration shows the latest form of the forward waterproof sparking plug, which, it will be noted, is fitted with a terminal which totally excludes dirt, rain, and mud from the insulator.



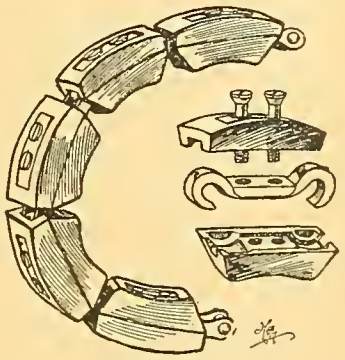
The Forward plug with waterproof cap

Handy Box of Patches.

The advantage of being able to carry half-a-dozen assorted patches in a handy tin in which they will be kept in good condition is evidently realised by the Severn Rubber Co., Ltd., Newhall Street, Birmingham, who have just placed on the market a small tin box containing six Severn special patches, which retails at sixpence per tin.

The Lily Patent Chain Belts.

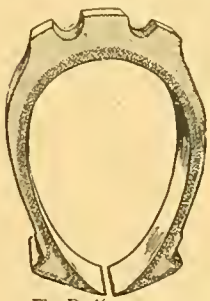
We have on previous occasions referred to chain belts manufactured by Mr James Haslam, Goodson Road, Fulham, S.W. On this belt, known as the Lily, the links consist of steel embedded in rubber, and thus protected from wet and grit. The joint is effected by hooks instead of links, embedded in a similar manner, and these are supplied in several sizes, so that varying lengths of belting may be obtained. The inventor claims that the belt cannot be stretched.



A chain link belt

The Redfern Tyre.

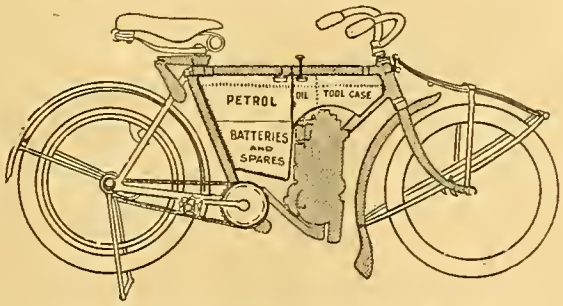
The accompanying sketch is of a tyre section taken from a cover manufactured by Messrs. Redfern's Rubber Works, Ltd., Hyde, Cheshire. The cover is of the three ribbed variety, of a pattern which we know to be exceedingly good, both as regards wear and absence of side-slip, and in its design care has been taken to form the contour of the tread in a rounded fashion, as this has been found by experiment to give better wear than the flat type tread with square spaces between the ribs. It will be noticed that the grooves or space between the ribs on the Redfern tyre are semi-circular in shape. The design of this cover is registered, and it is made in 26×2, 26×2¼, and 26×2½ for 2¼in. rims. These tyres have been used successfully in the Jarrott Cup competition and the London-Edinburgh run.



The Redfern motor cycle cover.

DESIGNED FOR RAILWAY TRAVELLING.

AN original little featherweight motor cycle has been constructed by a French private owner named Mignan. The engine is 60×70 mm. bore and stroke with an outside flywheel and battery ignition. The principal feature of the machine is that the large tank containing petrol and a compartment for the battery and coil is divided vertically into two parts and hinged, which allows it to be detached and folded and carried under the arm, should the rider wish to travel by train and take the machine with him. The front part of the tank is a tool case, the oil compartment is in the centre, and the petrol compartment at the back. The batteries, trembler coil, and spare parts are carried in the lower portion. The engine is reminiscent of the Clement-Garrard, and is fixed to the frame by one lug which renders removal a simple matter. A special spring fork with a flat leaf spring, and provided with safety tubes, is a feature of the machine, the action being clearly brought out in the line drawing which we publish. The main reason for providing removal of the petrol and battery partitions is that in France the machine then becomes an ordinary cycle, which may be carried as passenger's luggage for any distance by rail by payment of a registration fee of a penny.



Mignan's featherweight machine with detachable tank and engine.

The weight of the complete machine is in the neighbourhood of 70 lb

A Novelty in Trials.

Something in the nature of an innovation in motor cycle trials is likely to be held on September 26th, when the Streatham and District M.C.C. propose holding a trial for military motor cyclists. Subject to the final rules being approved, the A.C.U. have decided to grant the usual permit.

Motor Cyclist Messengers.

From several sources we learn of the great reliance placed on motor cycle despatch riders at the front. One of *The Daily Mail* correspondents states that the enemy have learned our bugle calls by heart, and consequently nearly all messages are carried by hand and motor cyclists are entrusted with this important work. This is an immense testimony to the reliability and ability to get anywhere on motor cycles, as, of course, they often have to operate over the roughest of open country.

Motor Cycle Imports and Exports.

The Board of Trade returns for the month of August, 1914, are now to hand, and show that, despite the war, there is still a large trade being done by British manufacturers of motor cycles. In August, 1,324 motor cycles of an export value of £55,511 were sent out of the country, bringing the grand total for the first eight months of 1914 to 14,231 motor cycles, value £612,951. Imports of motor cycles for August, 1914, totalled 97 machines, value £3,831.

The Triumph Co., Ltd., and its Shareholders.

Last week a statement was made in one of the evening papers to the effect that the capital of the Triumph Cycle Co., Ltd., was mainly German, and that the shares were mainly held by Germans. We are informed by the Triumph Co. that this is an absolute misstatement. Over 95% of the capital is British, and in the hands of British subjects. Those who know the Triumph Co. scarcely need reassurance in this matter, and there is no doubt that they have done more for the British motor cycle industry than any other firm in this country, because they stuck to the manufacture at a time when the motor cycle movement was at its lowest ebb, and when other cycle firms were dropping out of it.

The Motor Cycle Industry and Recruiting.

A paragraph has appeared in the press this week speaking in disparaging terms of Coventry as a recruiting centre, and making the remark that, whereas in London one sees hundreds of men in khaki, one hardly ever sees a Coventry man in uniform, and winds up by querying whether Coventry is going to ignore Lord Kitchener's appeal for men, added sarcasm being imparted by the printing of "men" in capital letters. Anything more absurd it is impossible to imagine than this paragraph, which is a gross insult to the motor cycle industry, for, as a matter of fact, we are informed by the Chief of the Recruiting Station at Coventry that recruits at a rate of a thousand per week have been accepted, and, further, that they are of the very highest type. The statement that men are not seen in khaki only accentuates the lack of knowledge of local conditions displayed, the simple reason being that none of the recruits are equipped in Coventry itself,

SPECIAL FEATURES.

NEWS FROM THE FRONT.
SIDECARRIERS FOR TRADESMEN.
THE LATEST FREAK HILL.

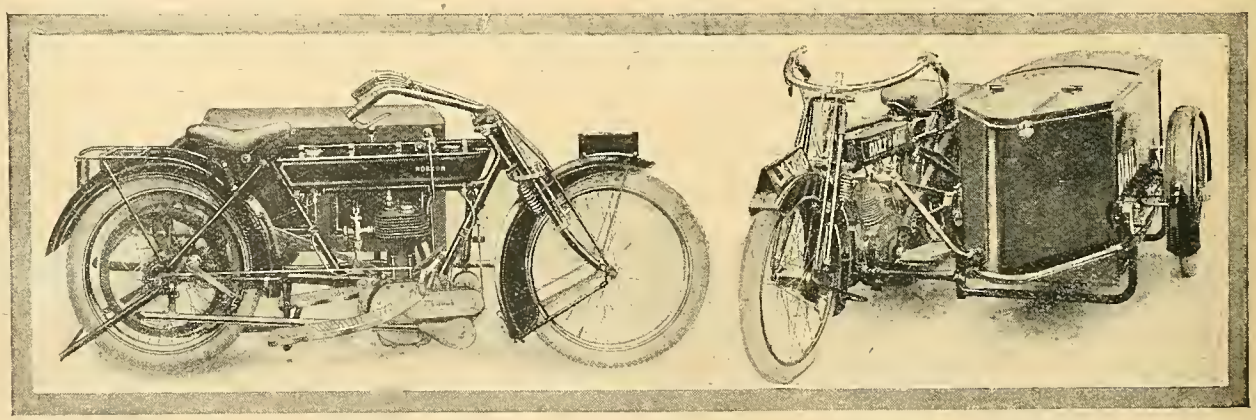
but the moment they are enlisted they are drafted to the various depots in the surrounding district, where they receive their kit and uniform. Further, it may be mentioned, that owing to the great congestion on the recruiting office at Coventry a large number of Coventry men are joining at Nuneaton and Warwick, and leaving direct for the Army Service Corps with the machines they are accustomed to drive. Incidentally, it may be stated that, by two days after the declaration of war, Coventry had sent off three thousand reservists.

Directors at the Front.

It is not often one finds such a degree of patriotism as that shown by the directors of Messrs. Burney and Blackburne, Ltd. Messrs. Cecil Burney, Alec Burney, and C. Q. Roberts, three directors, volunteered for the front, and the latter's brother, A. Q. Roberts, has also gone.

Speed Judging Test.

The Finsbury Park C. and M.C.C. held a speed-judging test on Saturday last over a fifteen mile course near Radlett. The schedule speed was eighteen miles an hour, and the use of speed indicators and watches was, of course, prohibited. One mark was deducted from a possible hundred for every half minute early or late on each of the six sections. The winner proved to be C. W. Cooke (ninety-two marks), while J. Evans (eighty-nine marks) was second. The former thus wins the Touche Cup for the best aggregate score in the above event.



THE SIDECARRIER IN USE. On the left is the Norton, and on the right one of *The Daily Mail* Rex carriers

The Autumn One Day Trial.

The Auto Cycle Union has decided to proceed with the organisation of the Autumn One Day Trial to be held on October 28th. The centre from which this trial will be held will probably be Worcester.

Spares for War.

We are informed that following upon a large order for P. and M. machines from the War Office, Messrs. Phelon and Moore, Ltd., have just completed a further order for spare parts for the War Office, which, if built into complete machines, would be sufficient to manufacture nearly thirty-five motor cycles. The spare parts are being packed in three representative assortments to be held in reserve at three places abroad for the use of the Expeditionary Force.

The Show Question.

The question as to whether or not the Olympia Motor Cycle Show shall be held this year has been deferred for settlement until the end of the present month. At that meeting the Managing Committee will consider the suggestion of *The Motor Cycle* that the car and motor cycle shows be amalgamated this year in view of the state of the country. A number of manufacturers, it may be mentioned incidentally, have favourably commented upon our suggestion to amalgamate the shows in 1914.

Home from the Wars.

We learn that the three electrically-lighted Matchless sidecar outfits, which had to be left behind in France by R. E. Guest and the brothers Collier after the abandonment of the F.I.C.M. Six Days Trial, have turned up again at the Matchless works at Plumstead. There was no means of ascertaining from what place they were sent, but it may be imagined that Messrs. Collier and Sons were none the less pleased to see their valuable property again, even if it were a little the worse for wear through what had evidently been a rough journey.

Rifle Practice.

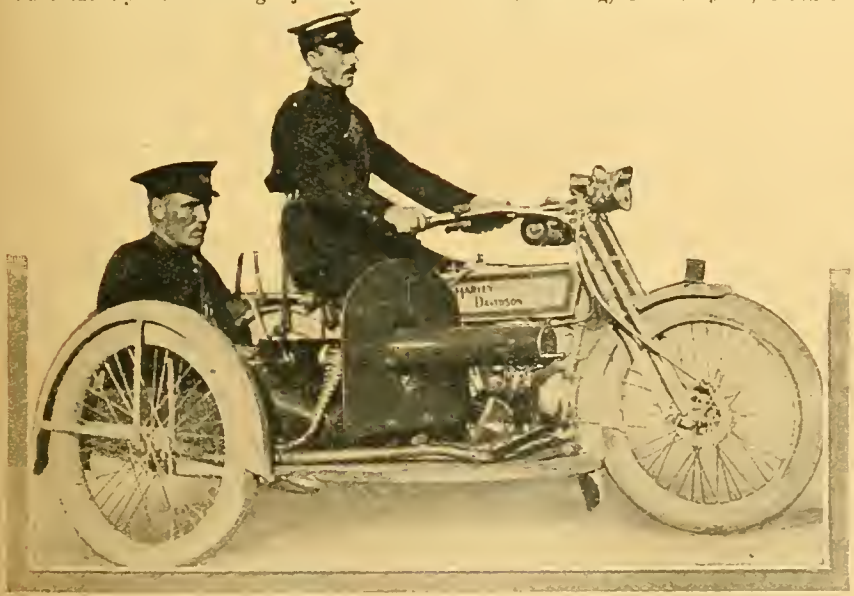
Considerable enthusiasm is being shown in the new rifle section of the Coventry and Warwickshire Motor Club. An instructor has been appointed, and the use of the Humber rifle range has been offered every Wednesday evening by Mr. Niblett, works manager of Humber, Ltd. Already the members are proving themselves proficient in the handling of a miniature rifle.

Out Again.

Last week we met W. Creyton, the Manxman, who was formerly with the Triumph Company, but latterly with Abingdon Ecco, Ltd. Creyton, it may be recalled, suffered a rather severe accident, due to a tyre bursting, whilst practising for the T.T. Race. He has been out of hospital now for three or four weeks, and we were glad to learn that he was ready for work again.

Identification of A.A. Members.

Members who have been constantly stopped and interrogated when touring have appealed to the Automobile Association for advice. Driving licences are not always accepted as a means of identification, for the reason that there is nothing on these documents to connect them with the persons carrying them. The Association is authorised by the Local Government Board to issue international travelling passes, which contain descriptions of the motor cycles to which they apply, and identify drivers by means of photographs attached. The pass is issued by the Association after examination of the motor cycle and driver. For this purpose it is only necessary for the driver to attend with his machine at the head office of the Association in London, or at any A.A. branch office. If none of these places be convenient, the examination may be carried out at one of the following towns where examiners have been appointed: Bournemouth, Carlisle, Darlington, Hull, Ipswich, Llandrindod Wells, Middlesbrough, Newcastle-on-Tyne, Oxford, Reading, Southampton, Stockton-on-Tees, Swindon, and West Hartlepool. For a motor cyclist the fee is 10s. 6d. Any international pass so issued may be taken advantage of when foreign touring again becomes possible, as it is valid for one year, and can be renewed without further examination at a cost of 3s. 6d., provided that application for renewal be made before the expiration of the pass.



Quartermaster Sergeant H. R. Northover, of the 90th Canadian Militia, with the Harley-Davidson sidecarrier and Maxim gun.

Vigilance on the Roads.

As showing the care exercised by the authorities in guarding the roads, we hear that W. Whitaker, a member of the Woolwich, Plumstead and District M.C.C., was stopped no less than twenty-one times on a recent journey from Dover to Woolwich. Near Ashford he noticed a steam roller held up, and the driver and his mate asked to prove their *bonâ fides*.

Americans after German Trade.

The Board of Trade has issued a circular in which the following appears: "According to telegrams from New York, United States of America firms are preparing to send a veritable army of commercial travellers to South America, especially to Brazil, Argentina, and Chile, with a view to capture of German trade in those markets."

High Speeds in Australia.

Some excellent speeds were recorded in the ten mile road race held near Donnybrook by the Victorian M.C.C. E. Tyler covered the distance at the rate of 60½ m.p.h., which constitutes an Australian record for an out and home course, and, considering the nature of the Australian roads, this speed is remarkable. The open event was very keenly contested. Results:

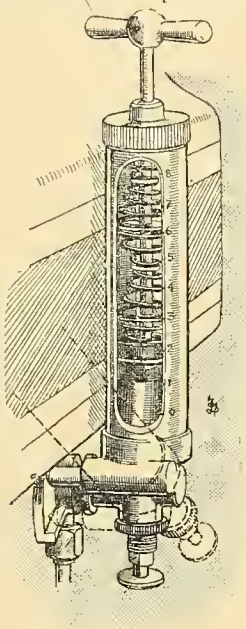
Sidecarriers for Maxims.

The illustration shows Quartermaster Sergeant H. R. Northover of the Ninetieth Regiment Canadian Militia, known as the "Little Black Devils." He also holds the rank of regimental armoury sergeant, and is the designer of the new fighting machine shown in the picture. The Harley-Davidson, which is handled in this country by Robertson's Motor Agency, 157, Great Portland Street, W., is fitted with a most flexible engine and, according to our informant, can travel at four miles an hour or can be hurried to a distant point at considerably over forty on favourable ground. During the manœuvres, when word was received that the Ninetieth would probably be in the first division from Canada to be sent to Europe, the motor cycle artillery was driven for two and a half hours through lines of people extending from the path to the middle of the road, and travelled through water and ploughed fields with the rest of the artillery.

THE LATEST IN LUBRICATORS.

An Ingenious Device combining Drip and Straight Through Oil Delivery.

MESSRS. ROTHERHAM AND SONS, LTD., whose name is famous as a watch manufacturing firm as well as makers of ingenious accessories for cars and motor cycles, are often responsible for interesting novelties, and their name is a guarantee of fine workmanship. The latest device produced by the firm is an unusual form of drip feed lubricator



A new Rotherham oiler, showing volute springs and graduated barrel. The dotted lines indicate position of barrel when set to return charge to tank.

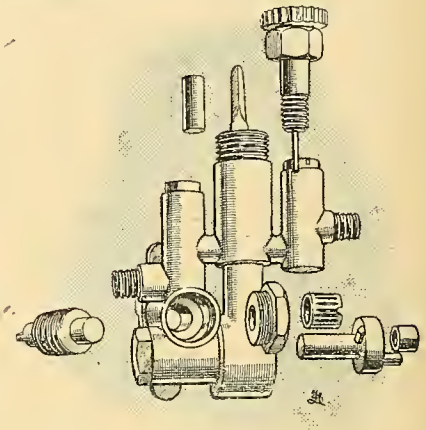
which incorporates several features distinct from the ordinary type.

The pump barrel is carried at the side of the tank and is pivoted at the bottom so that it may be swung through a small arc. Normally it is held vertical by a spring plunger, and in this position the pump is connected to the engine and forces the oil through a valve by means of which the pace of the feed can be regulated, while a light application of the finger to a push button underneath allows a charge to run straight through and, a point of great importance, in no way disarranges the setting of the drip for the next charge.

Should part of a charge remain in the pump at the end of a run, by the simple expedient of pulling the barrel backwards through the arc already mentioned the oil is allowed to flow back direct to the tank, cleansing any sediment in its passage. An innovation in design is the use of six volute springs behind the plunger instead of the usual single spiral; this allows a longer working stroke per barrel length, and the springs compress into an extremely small compass and also provide a steadier pressure, so that the speed of the drip does not fall off so quickly as with a single spring. The barrel is of glass, and a white metal disc between the two leather plunger cups is easily seen, and the speed checked as it passes numbered graduations on the outside of the barrel holder. We have seen the pump in use and were extremely impressed with its possibilities.

A Mechanical Feed Pump.

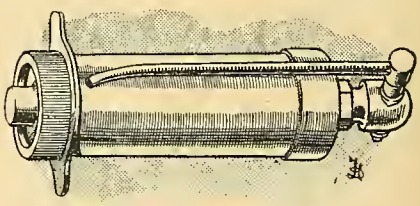
A pump of a very different type is the mechanical feed pump which has been in use by several well-known riders for some time. Harry Reed employs one of this type on his Brooklands 8 h.p. Dot. The drive from the camshaft is conveyed through a worm reducing gear to a spring returned plunger in the central barrel. Each of the two side barrels contains a simple non-return valve, and the oil is fed direct from the tank to the desired spot at a regular speed, which, of course, increases or decreases with the engine speed. A simple adjustment for the flow is provided by a milled nut acting through the return spring.



Rotherham's mechanical oil feed. The working parts are shown exposed.

A Clever Petrol Squirt.

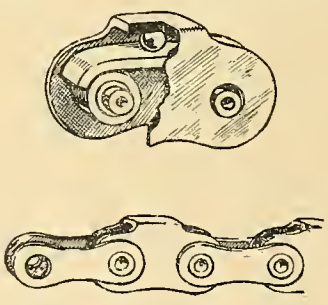
Another neat accessory is the tool kit squirt, which consists of a metal container, inside which lies a thumb-operated plunger, the nozzle at the bottom being pivoted. To fill or eject liquid the nozzle is turned outwards, but when turned back along the container the receptacle is closed and is claimed to be petrol-tight. When tested at the works we found it was even airtight, and if the plunger were depressed and the nozzle turned back the return spring was unable to overcome the vacuum.



Rotherham's self-filling squirt

THE CUSH CHAIN.

CHAIN drive is steadily gaining in public favour, but those who are accustomed to the belt maintain that it can never be so sweet and flexible. This point is open to doubt, and it is in an attempt to attain this end that Mr. H. Blocksidge, of 14, Frederick Place, Clifton, Bristol, has devised what is known as the Cush chain. Mr. Blocksidge is well-known among West of England motor cyclists, and his experience is long and varied, so that his assurance that the results obtained from his patent chain are excellent carries some weight. The idea of the device is to provide a certain amount of flexibility in the chain without spoiling the driving pitch, and his method of attaining this end can be clearly followed from the appended sketch. Every other link is formed in an arch, and the roller pins are allowed to float in enlarged holes in the side members. They are normally held in their lowest position by a strong leaf spring held in position under the arch by a steel ball engaging in recesses or dents. The springs are turned over at the end so as to maintain the correct pitch as far as possible under all circumstances. Yet it will be seen that under sudden loads, such as when the engine is running slowly on a high gear, the chain will stretch slightly and take up the jar. An additional advantage is that the arch and springs protect the rollers from mud, and the links are practically self-cleaning. Should the springs weaken after prolonged use, they may be renewed by slipping a dented flat spring over the standard curved one and thus bringing the pressure up to the normal state once again.



The construction of the Cush chain.

It may be added that exhaustive experiments have been carried out on a 3½ h.p. single-cylinder machine and sidecar, and we are told that not only has the chain stood up perfectly, but that the increased comfort provided by the Cush chain is very noticeable. All parts are carefully hardened.

" . . . repair outfit . . a needless encumbrance "

Messrs. W. & A. Bates, Ltd.
Leicester

Taunton Devon,
Aug 26th 1914

Dear Sirs,

I should like to inform you of the high esteem in which I hold your tyres

I have run them on my T.T. Triumph over the worst road surfaces in Devonshire at forced high speeds, during the worst of weather, for over 2,500 miles without a single puncture and the tread is now as good as ever on both rear and front tyres

Bates' excellent tyre service is liable to breed contempt as a puncture repair outfit seems a needless encumbrance

When re-fitting tyres I shall always emphasize "must be Bates."

I will send you my rear cover for your inspection if it is of any use to you, they seem fit for another 2,000 yet

Wishing you every business success with your tyres which are the highest pinnacle of efficiency.

I beg to remain
Yours fraternally,
(Signed BERT OSTLER

Note the centre of the tyre section illustrated, it is dome shaped, extremely thick, and takes all the heavy wear.

On each side are scientifically designed ridges. Note how these ridges grip the road and prevent sideslip when your mount heels over. If the machine doesn't heel, the ridges don't grip, therefore don't wear.

They are there when wanted.

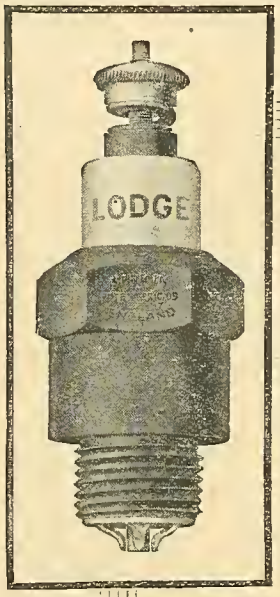
Send for the Bates' Book, "Truth and Tyres."

It's full of useful tips, and hows and whens and wheres — things that every motor cyclist wants to know.

It will be sent free for the asking. Just your name and address on a postcard, that's all.

W. & A. BATES, LTD.,
St. Mary's Mills. LEICESTER
Depots: London, Glasgow & Newcastle-on-Tyne

Bates SUPER RUBBER. Tyres



¶ Hitherto we have refrained from recommending motorists to use Lodge plugs simply because they were British made.

¶ Our aim has always been and always will be to make the **best** plug in the world.

¶ We understand, however, there is at this present juncture a special desire of motorists to know which accessories are really British Accordingly we have pleasure in stating that

LODGE PLUGS

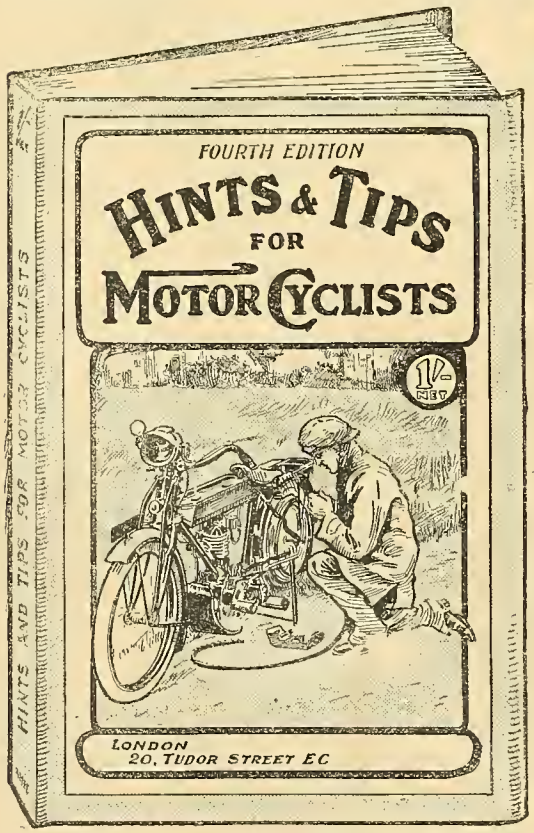
are made in England, : by an English firm, : with English capital.

AS USED BY ALL H.M. GOVERNMENT DEPARTMENTS.

Standard model, as illustrated, **4/-** each, of all dealers,

or post free by return when remittance accompanies order, direct from the manufacturers:—

THE LODGE SPARKING PLUG Co., Ltd., BIRMINGHAM.



FOURTH EDITION

Revised, Enlarged, and brought up to date.

"Hints and Tips for Motor Cyclists" contains what may be termed the cream of all motor cycling knowledge up to date. The book gives hundreds of useful "wrinkles" and little items of information concerning the running, management, and repairs of motor cycles, culled from the experience of many years of riding, and covering every detail of the machine. The arrangement is simple and straightforward and reference is simplified by an extensive index and marginal subtitles on every page. Invaluable to the new rider.

Price 1/- Net. ∴ By Post 1/2

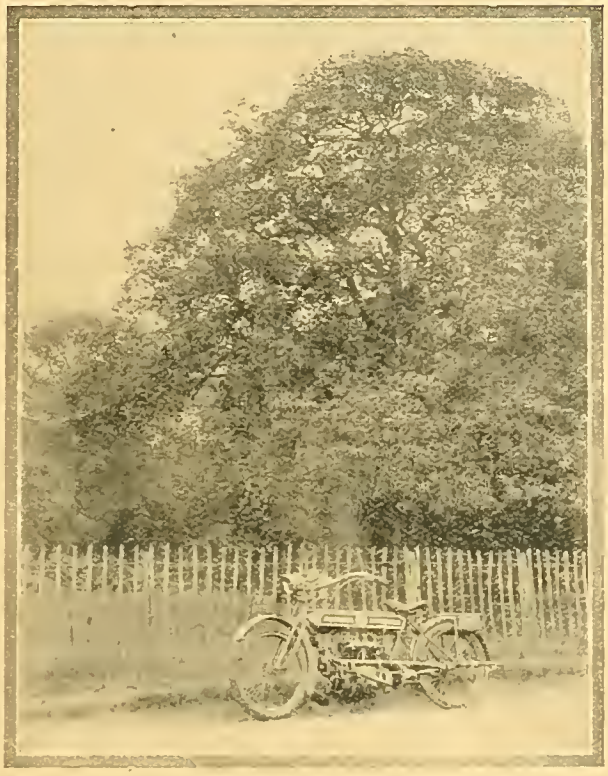
The Latest 7 h.p. Four-cylinder F.N.

A Powerful and Flexible Machine: Mechanical Inlet Valves and Special Lubrication.

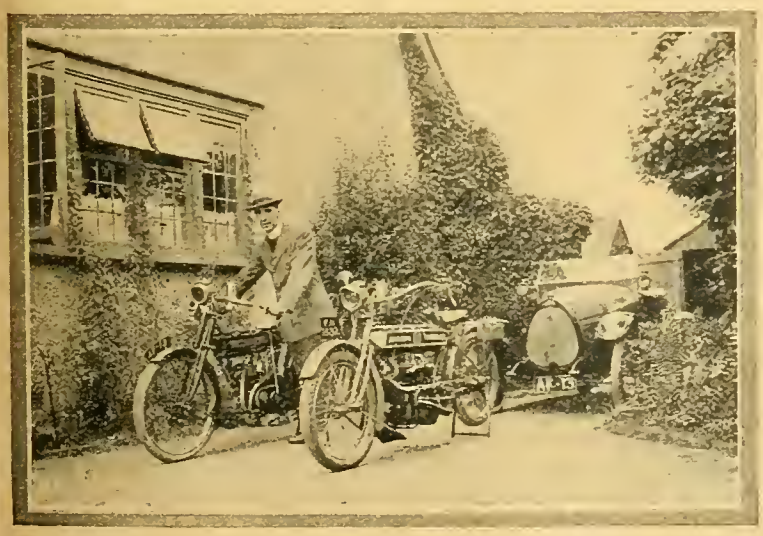
SO much has been heard about Liége of late and the gallant defence its suburb Herstal made against the Germans, that a few lines concerning the well-known products of the Belgian small arms factory, which is situated in that locality, and, as is well known, took no small part in the proceedings, will be of interest. Thanks to the courtesy of Mr. Gelder, the manager of the F.N. motor agency in London, we were given the opportunity of testing both models, the 2½ h.p. and the 7 h.p., though, owing to its being the newer of the two, we intend to deal more fully with the latter. The smaller of the two machines is a thoroughly handy and practical little mount, of medium weight, and of moderate horse-power, capable of an unlimited amount of hard work, and possessing the admirable wearing qualities for which the F.N. is famous. Our experience with it was in the streets of London, in which it acquitted itself splendidly and was a most appreciable help to us in our work. We were much interested and pleased at the smoothness and silence of the bevel drive on this machine.

Novel Points in Motor Cycle Practice.

The 7 h.p. is a great contrast to the latter. In the first place, it is an entirely new model which was only introduced at the beginning of the year, and about which as yet little has been written. At the time of its appearance at the Show it created much interest on account of the many novel features it embodied, features not necessarily new in themselves, but novel in motor cycle practice. It was the first machine to emanate from this factory which was fitted with a four-cylinder engine equipped with mechanically-operated inlet valves, and the first motor of this type to be fitted with a mechanical system of lubrication. Add to these the gate change, the three-speed sliding gears, and the multi-disc clutch, we find points which at the time of its introduction could not be said to conform to the practice usually followed by motor cycle manufacturers. As may be imagined, with all these refinements a machine of 7 h.p. is by no means a lightweight, in fact the new four-cylinder F.N. makes no pretence of being anything but a heavy mount, and in this short article we will endeavour to show, as we have done on previous occasions, that weight matters very little on a motor bicycle.



A fine old oak between Leatherhead and Chessington.

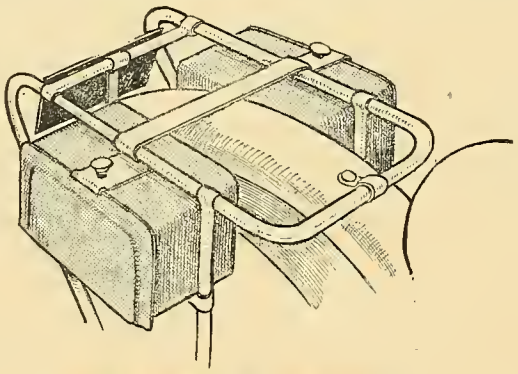


Preparing to start

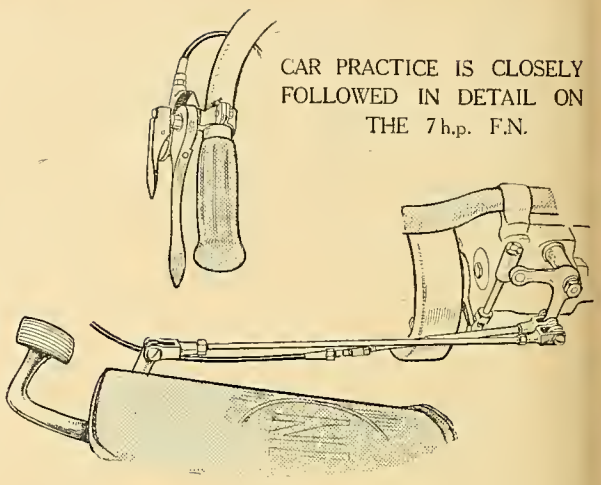
It is only when the machine has to be wheeled about or pushed from place to place that the extra weight is at all noticeable, and it was with the intention of trying to prove this fact that we purposely had the sidecar, with which the machine was fitted, removed. Once on the road the weight was absolutely forgotten, exactly as was anticipated. Even from dead cold the engine would start on the first or second depression of the excellently designed foot starting device. The clutch was a little difficult to free owing to its having an extra plate, but when once warm it gave no further trouble in this respect. Changing up was not quite so easy as changing down. If no real difficulty was experienced, and it must be pointed out that the machine we were using was by no means a new one, and had seen much service. It had been originally ridden by Gosse, who had accompanied us on it most of the way of the last London-Edinburgh run.

The Latest 7 h.p. Four-cylinder F.N.—

We found the engine to be extremely flexible and capable of the most extraordinary powers of acceleration, which were more strongly developed than in any other machine we have yet ridden. It is with no exaggeration that we say that when the throttle was opened the saddle seemed inclined to slide from under us. The sense of such enormous power was delightful, and, of course, greatly increased the pleasure of driving. It was not until we had left the great city behind that we were fully able to appreciate the wonderful turn of speed the machine possessed, or to appreciate to the full the marvellous acceleration, but it suffices to say that we were entirely satisfied in both these respects. We lunched with our friend the Rev. E. P. Greenhill in the country, who afterwards set out with us on his twin 3½ h.p. Motosacoche to climb one or two of the best known Surrey test hills. Not far from his house is Wray Lane, at the top of which we arrived. We descended to the bottom and by doing so were able to realise its severity, and then turning round sailed up without any run. The F.N. took it in excellent form, climbing all but the last portion on top gear, the second being only requisitioned for the last few yards, which are really steep. Next we went down Reigate Hill and made our way to Betchworth, whence Pebble Hill is reached. This was taken on the run, and two-thirds were covered on top speed, the rest was finished on second at certainly not less than twenty-five miles an hour, a feat which pleased us greatly. The return journey was made through Leatherhead, where we said good-bye to our companion, and Surbiton. We found the spring forks very efficient and the machine steady and most comfortable to ride. In traffic the hand-controlled clutch was a delight to operate, the brakes were smooth in action but powerful, and the machine as a whole most satisfactory, while despite its weight and power it was very tractable. What contributed in no small measure to its extreme comfort were the 650 mm. × 75 mm. Engelbert tyres fitted, which, like the F.N., are of Belgian manufacture.



Metal tool boxes on the four-cylinder F.N



CAR PRACTICE IS CLOSELY FOLLOWED IN DETAIL ON THE 7 h.p. F.N.

Hand and foot-gear control on the 7 h.p. F.N

German and Austrian Motor Cycle Trade.

AN exceedingly interesting table of figures, showing the number and value of motor cycles exported from Germany and Austria-Hungary, and the country of their destination has just been issued by the Commercial Intelligence Branch of the Board of Trade. The figures given for Germany are those of 1912, and for Austria-Hungary those of 1913. Of course, the totals are vastly inferior to those of Great Britain, but all the same quite a decent total is shown by Germany, which it is well worth an effort by our manufacturers to pick up. The total exports of motor cycles from Germany in 1912 amounted to 3,084 complete machines, valued at £124,600. The best customer was Russia, who absorbed 577 machines, but this market is likely to prove unfruitful in the near future. Denmark comes next with 503 machines. The United Kingdom took 214 German motor cycles in 1912

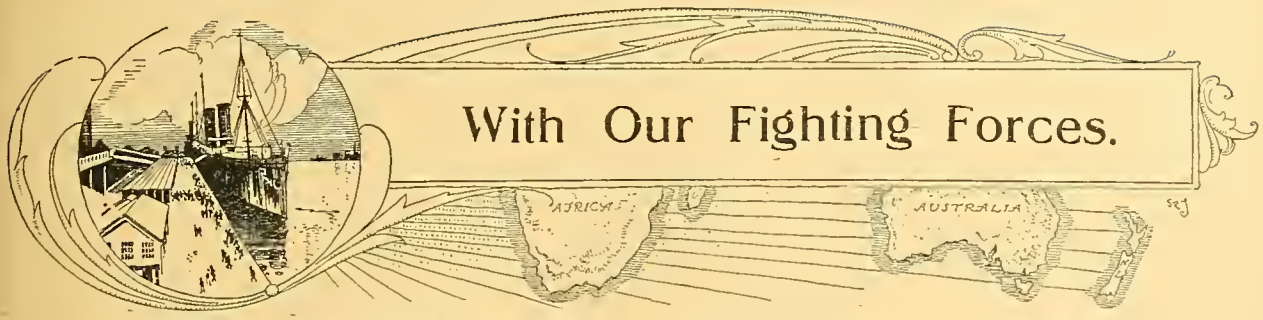
Denmark a Likely Market.

The Austria-Hungary figures are feebler than the German, as in 1913 only 157 complete machines were exported, of a total export value of £6,690. Denmark is again the best customer, taking 30% of the output. This goes to show that the Danish market is one to which our manufacturers should pay immediate attention, more particularly as relationships between Denmark and Great Britain are of the happiest description.

Against these figures it may be well to recall that the total exports of motor cycles from Great Britain during 1913 were 16,887 machines of an export value of £734,319. These figures would easily have been bettered had peace continued throughout the year, and without doubt, after the war, will rapidly rise to a still finer total.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost" and "Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and all that are notified to us are inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.



With Our Fighting Forces.

Exciting Experiences Related by Motor Cyclist Despatch Riders.

OWING to the fact that our interview with Vernon Busby last week took place just as we were going to press, it had of necessity to be cut somewhat short, but it may easily be imagined that his experiences would fill a great deal more space than that which we were able to devote to them in our issue of September 3rd.

The first information that Busby had that he was wanted was in church on a Sunday evening, and thereafter things moved apace. The reason of his selection was due to his wide experience with motor cycles, and the fact that he had served some time with the Yeomanry.

The first place at which he had to report himself was Chatham, the headquarters of the Royal Engineers. Everything was done in a terrible hurry, and there was only time for a few drills. An officer addressed the section and told them that they would be engaged in the most dangerous work, and if half of their number reached England again they would be lucky. The voyage from Ireland to the French coast was naturally by no means a comfortable one. The Signalling Company had to sleep on deck, and their food consisted of bully beef and biscuits, which, to the civilian accustomed to the daily comforts of English home life, was exceedingly trying. As far as we can gather, this fare was the mainstay of the company during the greater part of the time.

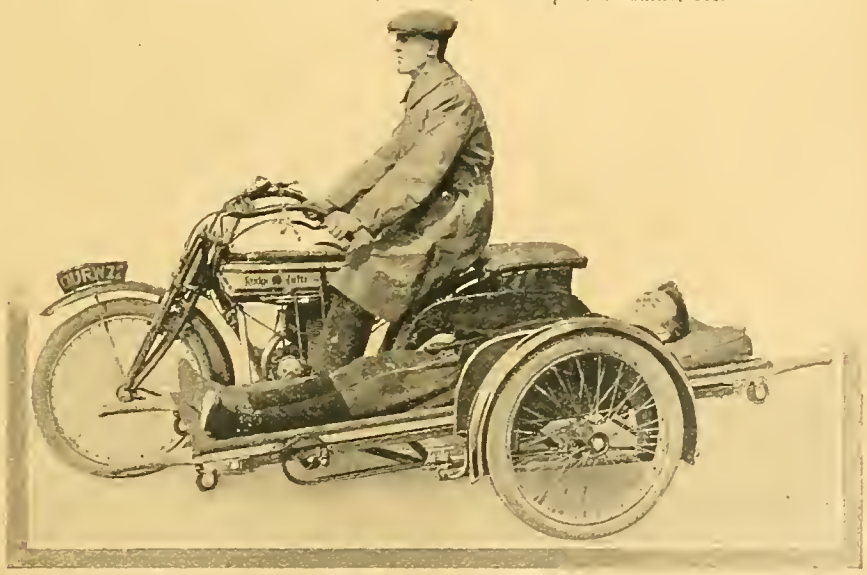
A New Fuel for Army Lorries.

It is interesting to note that in France all the motor vehicles attached to the Army, of which there was a very large number, were supplied with British petrol, taken over in two gallon cans. It was a curious mixture, and did not smell at all like ordinary petrol, consisting as it did apparently of a mixture of benzole and several different grades of motor spirit. Vacuum oil was also taken over in petrol tins painted white. Petrol was also taken in tanks and sometimes served out in open buckets.

The journey from the base to the front in guards' vans was also a by no means comfortable experience, the motor cyclists travelling in horse boxes of no great size and having to lie down as best they could by the side of their machines. At last the discomforts of the tediously slow railway journey were so terrible that, for want of something better to do, one or two of them climbed along the footboards and got on to the engine. The driver was extremely honoured to receive this visit from two English soldiers, and gave them a most hearty welcome; in fact, they had not been very long on the foot-plate before they were driving the train, pulling levers, blowing the whistle, generally making themselves at home, and enjoying themselves under circumstances which could not possibly arise on an English railway. It is interesting to note that the engine was fitted with a speedometer, the working of which the driver took much delight in explaining. *A propos* of this, we may mention that the reception accorded the Englishmen in every direction was perfectly wonderful, and over the Belgian frontier, men, who had never seen English troops before, would often come up to them and put their hands on them in a manner almost more reverent than affectionate, which was almost embarrassing, since the inhabitants regarded them as the deliverers of their country. In one or two districts the appearance of the English troops struck terror into the inhabitants, as, never having seen them before, they mistook them for Germans, and it took the French scouts and officers with the English column to explain their true nationality.

Difficult Work for the Motor Cyclists.

There were fifteen motor cycles altogether and two spares in Busby's detachment, and as the number of machines wrecked was considerable, the former were soon used up. The first time they camped out in the interior they quickly became aware that they were living under war conditions. No man could go abroad without a *laisser-passer*; and the signalling company wore a blue and white armlet, without which a man was liable to be shot at sight by any sentry. After two days in a French town they had again an order to advance, this time by road. Busby was responsible for all the machines in the section, and when the advance was made it was along a road lined with motor lorries, which raised the most appalling dust. The motor cycles had to get past them as best they could, sometimes climbing from the road way on to the path at the side, and hitting the crank cases in so doing; in fact, Busby emphasises the necessity for War Office machines being specially designed, and that, among other things, high crank case clearance and most efficient clutches were desirable. At a little town called P—— the troops arrived and took possession of the post office, in the garden of which Busby slept. Here they had a wonderful reception. The next day the motor cyclists were engaged all day long laying telegraph wires, hunting for faults, carrying despatches when the telegraphs failed, and going in search of lost transport columns, etc.



Motor cycle ambulances are now receiving a considerable amount of attention from the War Office and other bodies. The illustration shows the latest Rudge-Multi ambulance chassis, which has been submitted for the approval of the War Office authorities

With Our Fighting Forces.—

The next night was spent in a private house belonging to some wealthy resident, and here they were comfortable and procured many luxuries in the way of food and clothing. It is sad to relate that the said house two days afterwards was razed to the ground by the German troops. The roads all round were very bad, but not so bad as some which Busby struck in the South of France on the Paris-Nice Trial. Naturally the English riders grumbled a great deal about them as few had done any Continental touring. To take them as a whole, the men of the company were thoroughly good fellows, but most of them lacked riding experience, showing that they were chosen in somewhat of a hurry, while few of them were up to the standard of Busby, Berlandina, and Featherstonhaugh, men who are well-known in the competition world.

Excellent British Mechanical Transport.

Busby told us that the British Army was particularly well equipped with motor vehicles; that it had more motor cycles and, apparently, quite as many motor lorries and private cars as the other allies. There is little doubt that it had more motor cycles than any other of the armies engaged in the field of operations. A few French machines were seen, but comparatively few, and, of course, a number of well-known houses like the B.S.A., New Hudson, Douglas, and Triumph Companies, who have Paris agencies, were able to help to equip the French Army. On the occasion of a further visit to the hospital we found that Busby was getting rapidly better, and, after a month's leave, he hopes to be back again at the front.

The Harrowing Scenes of War.

H. H. Berlandina, who rode a Douglas, was in another ward of the same hospital, not wounded by shot or shell, but by the ordinary harmless barn-door fowl. It appears that he was engaged in cutting telegraph wires previous to the retreat from the South of Belgium when someone told him that the Uhlans were only two miles further away. He finished his job, jumped on to his machine, and rode as if the whole German army was after him, when a luckless hen, crossing the road, was caught in the front wheel and threw him heavily to the ground. His injuries, though unpleasant, are fortunately not serious, and we found him cheerful and longing to be back at his exciting work. After we had sympathised with him in his bad luck, he told us some interesting facts about the campaign. He pointed out that one gets used to seeing dead horses and the bodies of those slain in battle lying about the countryside, but the most appalling scenes he witnessed were those of the trainloads of refugees coming out of the districts occupied by the enemy. At one place where they had to halt the trainloads came in every quarter of an hour. People were packed in open trucks, and were in the most pitiable condition, and many harrowing scenes were witnessed.

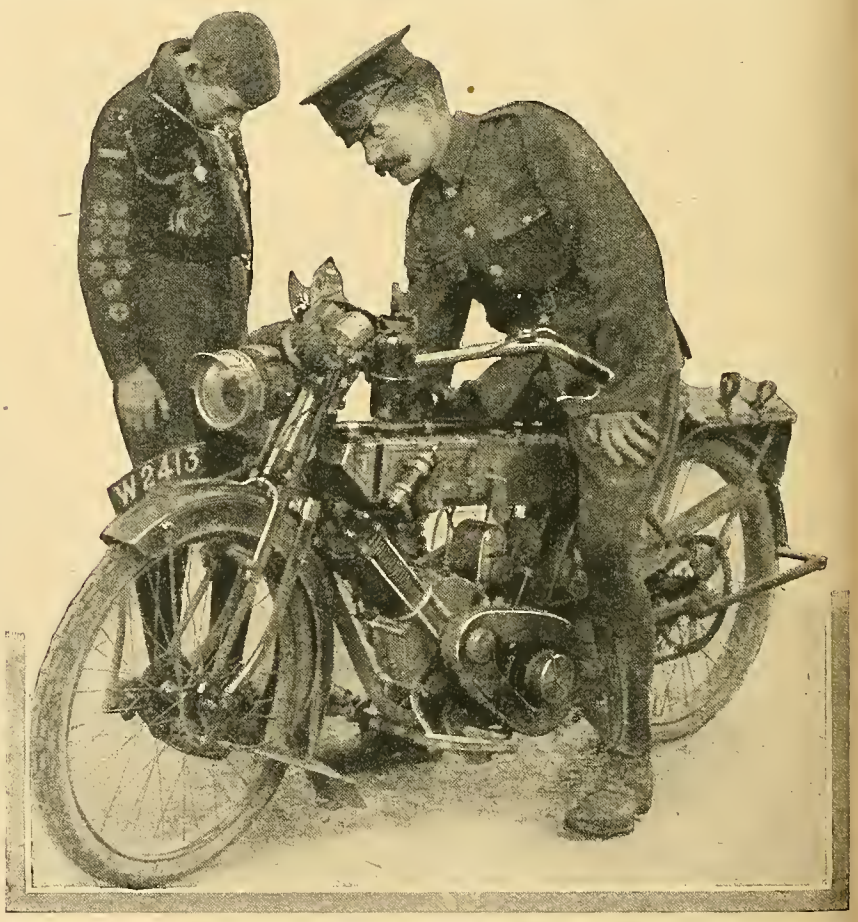
Adventures on the Eastern Frontier.

We have heard a certain amount concerning the English motor cyclists at the scene of operations in Southern Belgium and Northern France, but so far there has been no news about the motor cyclists with the French Army on the Eastern frontier. Now we have received news from C. L. Scott, known as a Rudge and a Motosacoche rider on the Continent, and the driver of an A.C. in this country. He was staying in a château close to a small village near Belfort, the Gibraltar of France, which remained intact during the war of forty-four years ago. On the still summer evenings he and his hosts used to sit in the château garden, three and a half miles from the firing line, listen to the booming of guns, the b-r-r-r of mitrailleuses, and the tap-tap of rifles. Often in the sky an aeroplane would come into view, then another: the first would soar steeply heavenward, and the second would circle round; then near the higher machine a flash would appear in the evening light, followed by a puff as of cotton wool. It was all tremendously exciting. These aerial fights were frequently seen, and the French machines would try and drive their enemies over the forts. One night the familiar bark of a motor cycle was heard coming down the road. Our friend dashed out to see who it was, and lo! it was Stoeffel, the well-known Alcyon rider. Surely a meeting even as curious as our own with Oblin on the second day of mobilisation! Stoeffel told Scott that his duty was to accompany a convoy of lorries with engineers and build a bridge across the Rhine.

French Army Motor Cycles.

Shortly after war had been declared the French motor cycle despatch riders were mounted on old-fashioned accumulator machines, which were worn out or useless not long after Paris had been left. But now things are better, and the French Government has commandeered better makes, such as Clément, Alcyons, Peugeots, and Motosacoches. No English machines were taken, but a few private owner volunteers were seen mounted on last year's B.S.A.'s and New Hudsons. The French motor cyclist, like his English ally, is armed with a revolver, but the German is equipped with a Mauser. The Germans, apparently, have a larger and better staff of motor cyclists, mounted on powerful machines. They work in conjunction with the Uhlans. The motor cyclist, of course, keeps to the highway, and the Uhlans scour the countryside.

Scott reports that our own men are doing well, though spares, especially tyres, were at first hard to procure, since only wired-on covers can be procured in the small towns.



Corporal Dickinson, a despatch rider attached to the Sheffield Division Royal Engineers, explaining the mechanism of his P. and M. to a Boy Scout.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

Remember that Mr. W. J. Clarke used this fastener on his wonderful 3,000 miles A.C.U. Sidecar Record.

Read what Mr. Clarke writes about this Plug

Dear Sirs,

I had from you, some time ago, one of your TYPE C Forward sparking plugs. I have given this a thorough testing on the road. I have now used it for over 2,000 miles, and I am pleased to say that it has not given the slightest trouble, and is still in as good condition as when I put it in the machine. Wishing you every success.

WM. J. CLARKE.

THE

PREMIER MOTOR STOCKISTS IN THE NORTH,

makes you this

UNPRECEDENTED OFFER:

1914 Model U and V. **DOUGLAS,** shop-soiled, complete, with speedometer, lamp, horn, and spare belt **£48**

Or what offers, less accessories.

1914 Model W **DOUGLAS,** slightly shop-soiled, usual price **£52,** to clear..... **£45**

OFFERS WANTED

FOR THE FOLLOWING:

Usual price

1914 4 h.p. **TRIUMPH,** 3-speed gear **£60 0**
1914 4¼ h.p. **JAMES** Combination **£76 13**
1914 3 h.p. **ENFIELD,** 2-speed gear..... **£52 10**
1914 3¾ h.p. **SCOTT,** 2-speed gear..... **£68 5**
1914 3½ h.p. Twin **JAMES,** 3-speed gear.... **£63 0**
1914 2½ h.p. Imperial **J.A.P.,** 2-speed gear.. **£32 11**

SPECIAL BARGAINS.

1913 8 h.p. water-cooled **WILLIAMSON,** condition exactly as brand new **£60**

1913 brand new 6 h.p. clutch model **ZENITH** and Gloria coach-built Sidecar; **70 Gns.** the lot

1913 brand new 3-speed **JAMES** Combination; **60 Gns.** to clear

1914 3¾ h.p. **SCOTT,** shop-soiled only **£60**

1914 3-speed **PREMIER,** scarcely used **£50**

1914 **CALTHORPE** Junior, not done 100 miles. A real bargain **£19**

1914 Baby **TRIUMPH,** shop-soiled only. First cheque **£39**

1912 6 h.p. **ENFIELD** Combination, complete with all accessories **£48**

1912 6 h.p 2-speed **MATCHLESS** **£38**

1912 6 h.p. **CLYNO** Combination, complete with lamps, horn, etc. ..... **£40** or offers.

1912 3½ h.p. **PREMIER,** Armstrong 3-speed .. **£30**

1913 T.T. **TRIUMPH.** Very hot stuff **£34**

1912 free-engine **TRIUMPH.** Cheap **£30**

1910 **TRIUMPH,** perfect order **£18**

1912 2-speed **BRADBURY,** Sidecar, and all accessories, very powerful **£35**

1912 3½ h.p. **ROVER,** grand condition **£28**

12h.p. Taxi Car, lovely condition, running order, mag., Stepney, 5 lamps; exchange or sell, £35; photo.—241, Balfour Rd., Ilford. [6873

LATEST 4-cyl. 5-6h.p. F.N., clutch, 2 speeds, not done 2,000 miles; exchange good 8h.p. twin.—Hiscocks, Manor Rd., Farnborough. [6871

SCOTT, 3⅝h.p., 1913¾, 2-speed, F.E., handsome machine; £45; exchange 2½-3½h.p.—164, Broadfield Rd., Hither Green, S.E. [6946

HALIFAX.—Any machine taken in exchange against new 1913 Rexes at 15 per cent. discount.—Collier's Motories, Westgate, Halifax. [0446

PREMIER Sociable, complete with hood, screen, etc., 1913, for motor bike, or sell £55. — M. Wilkinson, Ashington, Northumberland. [6933

GENT'S 18 carat Gold Watch, repeater, cost £25, and little cash for lightweight, Humber preferred.—Lawrence, 58, Packington St., Islington, N. [6854

CLYNO and Coachbuilt Sidecar, 1912 model, nearly new, 6h.p.; £38, or exchange lower powered machine and cash to value.—76, Summerley St., Earlsfield, S.W. [6942

1913 7h.p. 2-speed Spring Frame Indian, perfect condition; £50, or would take good variable geared 3½h.p. in part exchange.—Minikin, 115, Bradford St., Keighley. [X9174

3½h.p. 1913 Service, Precision, new Mark VII. gear, new sidecar, speedometer, horn, watch, for 3½h.p. Indian or N.U.T.—Briodley, Third St., Horden, Durham. [X9228

REPAIRERS.

ANTOINE Cylinders, pistons, and parts; prompt delivery.

CYLINDERS, crank cases welded; quotations free.

COMPRESSION Cylinders ground and new piston fitted, 24/-.

OLDEST Engines restored to highest vitality.

COMPLETE Overhauls at lowest possible prices. Full stock of Rex, Triumph, and J.A.P. parts.

COUNTER-SHAFT Gears.—We can now quote the trade for our Rex-J.A.P. 3-speed gear at inclusive prices, including fitting to old machines.—The Premier Motor Co., Ltd., Aston Rd., Birmingham. [0246

WHITTALL Machinists' Co., War Office Contractors, for all repairs.

WHITTALL.—Expert welders; repairs returned, accurately machined, inside 7 days. No charge if unsuccessful.

WHITTALL.—Re-boring and new pistons. All motor repairs. Old engines rejuvenated. All work guaranteed; no exasperating delays.—Whittall Machinists' Co., Whittall St., Birmingham. [0136

VALVES.—Nickel steel valves, any size, 3/6; per pair 6/-.—C. R. Foster, Kirkstall Rd., Leeds. [0253

WELDINGS, Ltd., Dept. M.C., 235, Gt. Ancoats St., Manchester.—Oxy-acetylene welding experts.

BROKEN Flanges, valve seats, pistons, crank cases, water jackets, welded and machined complete.

SEND Your Old Engine or complete machine for overhauling, re-bushing, cylinders re-ground, new pistons, rings, and gudgeon pins fitted.—Weldings, Ltd., Dept. M.C., Manchester. [6234

WELDINGS, Ltd.—Broken cylinders, lugs, flanges, valve seatings successfully repaired. No cure no pay.

ALUMINIUM Cases, gear boxes, pistons, connecting rods permanently restored; no distortion.

CYLINDER Re-grinding on latest machinery; engine overhauling. We restore your engine to its original condition, and guarantee workmanship.

AVOID Annoying Delay, and assure efficiency at low cost by sending your parts to Weldings, Ltd., Dept. M.C., 37, Holt St., Birmingham. [6081

CYLINDERS, Crank Cases welded; quotations free; send your enquiries.—Premier Motor Co., Aston Rd., Birmingham. [0248

OXY-ACETYLENE Welding, first-class work; moderate quotations.—Purcells, 78, Charlotte St., Tottenham Court Rd., W. [6750

CRACKED Cylinders, castings, forgings, etc., successfully repaired by Lea's metallurgical process.—Lea, Engineers, Runcorn. [5197

Sidecar Samaritans.

AS everyone is aware, there is a large number of normally active and healthy men detained in hospitals in various large towns of the United Kingdom suffering from wounds sustained in the war. The authorities state that the great mass of these wounds are slight, and very largely in the legs and feet. This means that many of these sufferers are able to enjoy the pleasures of life with the exception that they are unable to move about with any freedom. Provided they are not suffering from shock in addition to their wounds there can be no doubt that the best way to quick recovery is to enjoy plenty of fresh air, and we believe that there are hundreds of these men who would be only too pleased if the opportunity arose to be able to take a run once or twice a week into the country in order to recuperate their strength as quickly as possible. We believe that many of them would immensely enjoy an occasional run in a well-equipped sidecar if the chance occurred, and we do not suppose that their medical advisers would raise any objection provided they were satisfied that their charges would be well and carefully driven, and we think that it might be possible for many motor cyclists owning sidecars to arrange with the nearest hospital containing wounded men to put their machines at the disposal of the hospital once or twice a week and offer their services as drivers in order to take some of our gallant wounded for runs in the country.

Of course, permission of the authorities, more particularly those of the medical profession, would have to be obtained, but in the case of really slight wounds we have no doubt such attention as we have indicated would be welcomed, and this procedure would be at once a graceful acknowledgment to the War Office for the enthusiastic manner in which the authorities have taken up the use of the motor cycle in war, and at the same time be the means of bringing back health to the wounded and affording pleasure to the owner. Any general plan of campaign in this direction would be impossible to organise, and it should be left to individual owners of sidecar outfits to proffer their services in this direction to the authorities of the nearest hospital.

Motor Cycle Machine Guns.

THE idea of fixing a machine gun on a motor cycle is by no means new, and is even older than the armoured motor car. It was at the time of the Richmond Show in 1899 that the first motor cycle machine gun, consisting of a Maxim mounted on a trailer and towed by a De Dion tricycle, was demonstrated by Mr. F. R. Simms, one of the founders of the Royal Automobile Club. At considerably later dates quick-firing automatic rifles have been fitted to the handle-bars of motor cycles, and have been demonstrated on T.M.C.'s and Scotts, and even exhibited at the Olympia Show. We think that there is a distinct future for the machine gun fitted to a motor cycle and sidecar. Reference has already been made in these pages to a Scott equipped in this manner, while on page 329 of the issue of September 10th a photograph appeared of a Harley-Davidson fitted with a Maxim gun, belonging to the Ninetieth Canadian Militia. Owing to the extraordinary mobility of the vehicle and the deadly effect of the little weapon, a number of these sidecars could inflict an enormous amount of damage on the enemy's outposts. We therefore commend the attention of the War Office and the motor cycle manufacturers to the study of such equipment. It certainly requires careful study, as the whole machine must be made immensely strong, since there are several new factors to consider—the extra weight of the gun and the effect of the latter's recoil upon the frame, in addition to the ordinary road stresses of which the motor cycle designer is aware. The question of recoil is, however, one for gunmakers, and we do not presume to advise upon it.

Over the Roof of Lakeland with a Lady Driver.

By GEORGE D. ABRAHAM.

Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures at Home and Abroad" etc., etc.

A wayside halt for refreshment 'neath the crags below Blea Tarn Pass. The old daleswoman (aged 82) described the lady driver as "The pluckiest lassie in all England."

FROM spy-hunting to hill-hunting is a pleasant change. All Lakeland had been stirred by rumours of German incursions, and "wanted persons" were sought for even in the quiet dales. A German airship had been seen and heard by numerous people, troops mounted on horses and motors as well as on foot had scoured the district in search of its base. The ubiquitous motor cycle had been almost everywhere. For the first time the lack of a military road from east to west across the mountains had been seriously felt. The importance of the lofty Lakeland fastnesses as hiding-places fo those with evil intentions on Barrow-in-Furness, th birthplace of Dreadnoughts and airships, was realise Motor cars had been stopped and searched on ente ing the principal towns.

Thus there was peace in getting away from th Metropolis of Lakeland to try conclusions with som of the famous hills. The outing arose from a questio asked me by Mrs. Mary Riley, one of the be known and most skilful of lady sidecar drivers in th country. "What is the hardest hill test in the Lak District?" she enquired. The answer was, "Up Re Bank and over Blea Tarn Pass to Little Langdal whence Wrynose and Hard Knott might be crosse to the sea coast road and thence northward again b Honister Pass." The redoubtable lady driver ha already successfully tackled some of these problem but the notorious Blea Tarn Pass, which had defeate practically all the riders, solo and otherwise, in th well-known One Day A.C.U. trial of nearly two yea ago, was unknown to her. Certainly no lady driv had ever crossed it, and local information says th no sidecar had made a non-stop run over the pass.

An Adventure with Yeomanry.

Thus it came about that the hot sun of a glorio August afternoon saw us speeding swiftly along th shores of Thirlmere. Peace reigned all round 'mid the heathery heights, and the calm lake gleamed the foliaged depths. The uproar of the outer wor seemed far away. Yet a distant glimpse of khal clad figures showed that Manchester's water supp was not forgotten in the great scheme of national pr tection. Soon we were breasting the easy rise of Du mail Raise, with a well-known Midland expert on 2¾ h.p. Sunbeam making the pace and great du accordingly. Small wonder that his love of speed l

Descending into the depths of Little Langdale from Blea Tarn Pass. The road is seen 50 feet below, and the leading motor cycle is the 2¾ h.p. Sunbeam which succeeded in crossing th formidable pass.

O the Roof of Lakeland with a Lady Driver.—

h into trouble next day. In the early hours of the
rning he essayed to ride round Skiddaw. With
sttling suddenness he was called upon to halt by a
hden troop of yeomanry who were on the look-out
f the aeroplane. Whether he was mistaken for this
o a German spy is not quite clear, but there was con-
serable delay and unpleasantness before he was free
tcomplete the early morning tour.

n Grasmere village we swung round to the right,
leving the main road and making for the narrow
tsting road on the west side of the lake, 'midst
heysuckle shades, full-scented with meadow-sweet
al lightened by the blue gleam of harebells. Then
che more practical matters. The foot of Red Bank
ws reached. The long-suffering passenger who had
rden thus far on the tool-bag dropped off gladly at
th foot of the famous gradient. I had every confi-
dce in the "woman at the wheel." Thus the ques-
th asked with a pleasant smile, "Are you not
nvous?" seemed somewhat unnecessary even to one
wo had never previously trusted himself to a fair
ntor driver. Any doubt or thought of the matter
ws immediately dispelled, for on the steepest section
she stray mountain sheep suddenly leapt the wall.
Mst drivers and their machines would have been in
tuble in such a tight corner, but not so my com-
pion. She kept remarkably cool, and the engine
nst have done the same, for it recovered splendidly
frm the sudden slackening, despite its load and the
slpery gradient of 1 in 3⅝.

After admiring the wonderful view of Grasmere's
pceful vale from the brackened slopes above the
cst of the hill the road was followed which swerves
ay to the right beyond Red Bank. This led us up
toHigh Close and thence down into Great Langdale
bthe long curly hill over gradients which, by the way,
if taken from Elterwater village, would form a splendid item in some future Lakeland trials. Once in the bed of the valley it was quick travelling, with the shapely twin Pikes of Langdale ahead ever gathering in grandeur on nearer approach.

The natives were much astonished at the sight of a lady driver on a sidecar. During a halt at one of the local speed limits in the shape of a solid Lakeland gate across the road, some local worthies were not slow to express their opinion of the men of the party. "Tha should wear th' trousers!" said one gruff old dalesman to the lady driver. "Perhaps I do," answered our expert as with apt acceleration she sped us onwards out of the hearing of more frivolity. There was also astonishment at the farm house at Blea Tarn Pass,

An anxious moment on the "rough." The 6 h.p. Enfield on the upper zigzag of Blea Tarn Pass. The highest point of Langdale Pikes is seen above.

limbing to Tarn Hows by Yew Tree Hill—a skilful swing round the well-known "hairpin" bend, which surprised so many riders in the A.C.U. Six Days Trials last year.

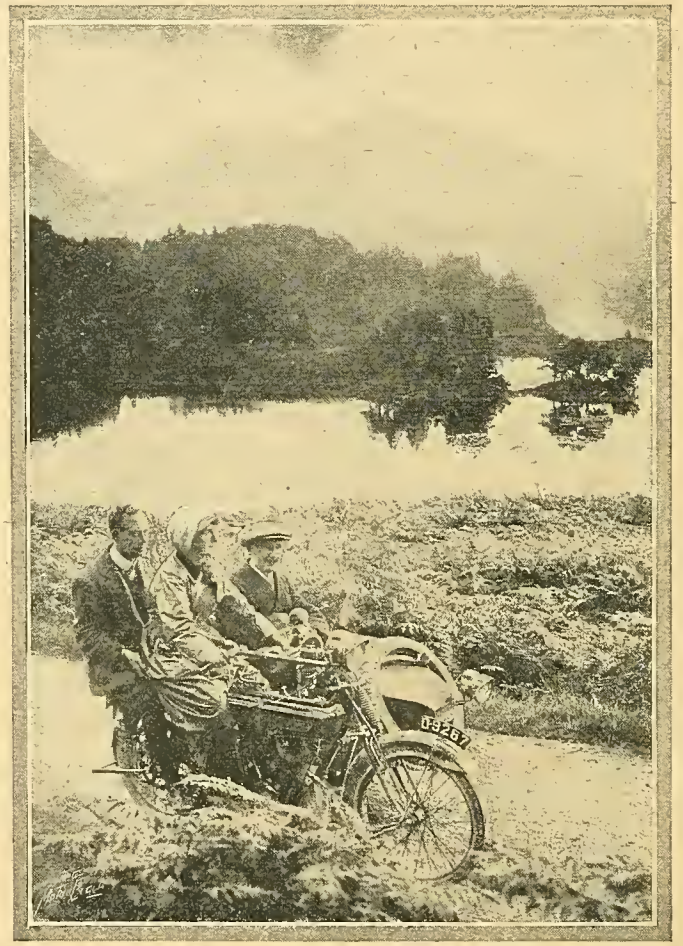
Over the Roof of Lakeland with a Lady Driver.—

but we had grown hardened to staring passers-by, and all attention was turned to the work ahead.

An inspection on foot was first made of the lower part of the famous hill. Main interest would centre in the double zigzags about half-way up its mile-long length. There the steepest gradients prevailed, but nowhere were these more severe than 1 in 3¾. The serious feature was the surface, for this was composed mainly of fine weather-rounded stones and pebbles more or less held together by loose dust, an altogether unstable combination. Great skill would obviously be needed in picking out the more solid bits on the extreme side of the road, thus giving the driving wheel a firmer grip. This latter was shod with a somewhat worn Palmer tyre, which proved astonishingly efficient for the purpose.

How the Climb was Accomplished.

Thus whilst the two who were to trust themselves to the sturdy little Enfield descended to the beginning of the climb I sought a safe viewpoint on the zigzags. My advice to come slowly was unheeded, but the methods of the lady driver were justified. She came up with a rush 'midst a cloud of fine dust and a shower of small stones flung from the spinning driving wheel. With wonderful coolness she kept only inches wide of the edge of the depths on the right, but now and again there were nasty skids on the crumbling road-centre. Close by my side there was an unnerving slide on the zigzags which almost led me to grasp the machine as it seemed bound to disappear over the edge. Yet with remarkable nerve the swerve was checked just in time, and my help was never given. The machine obtained a firm grip on the turfy roadside and flung upwards to the final zigzag. What mattered a suddenly projecting boulder which hurled the machine bodily off the ground! It landed on sound surface, and upwards out of my sight the Enfield and its riders sped all-conquering. Far overhead there echoed the bark of the engine, and finally came peace which told that the crest had been attained.



'Midst the brackened heights by Tarn Hows above Coniston—a Lakeland beauty spot which is attained by climbing one of the stiffest hills in the district. The 6 h.p. Enfield and its full touring load is shown.

It was one of the finest hill-climbing performances I have seen. To make a clean ascent of Blea Tarn Pass at the first attempt was an achievement of which any hill enthusiast might be justly proud.

A Marvellous View.

Finally, the driver of the 2¾ h.p. Sunbeam arrived, also a meritorious performance, despite some halts, for it must be remembered that Blea Tarn Pass is altogether a more difficult and desperate problem than the ascent of Honister Pass. The Sunbeam had managed this with comparative ease a few days previously.

Exhilarated by successful achievement all were able to enjoy that wonderful but little known view on the downward way into Little Langdale. Blea Tarn, the most beautiful sight of its kind in Lakeland, lay on our right, with the great crags overhead mirrored in its depths and graceful firs bending over the shallows. Soon the purple valley depths lay below, and Wrynose Gap loomed overhead with the thin trail of roadway winding up to the heights. But our way now lay down the valley, away towards Coniston by Colwith, and over heather-mantled Oxen fell.

The last serious climb of the day was to be up Yew Tree Hill to Tarn Hows following the route and negotiating the well-remembered hairpin which troubled so many riders in the Six Days Trials. Though in her impetuosity my driver seemed in danger of jumping the midway gate, we sped speedily and safely up into the lofty mountainland once more, and the hairpin was dealt with in such a manner as showed the lady's familiarity with such things. Then the dense shades above the lake at Tarn Hows enfolded us in a gloom that gave warning of oncoming night. There was just time to halt for a short enjoyment of that glorious evening scene with grey mountains all round in the orange gleam.

An hour later Ambleside was left behind and we hurried northwards. For myself I did not know which to admire most, the little 6 h.p. Enfield with its remarkably efficient two-speed gear, or the lady driver who had handled it over a hill-round of surpassing interest and difficulty.

Hints for Beginners.

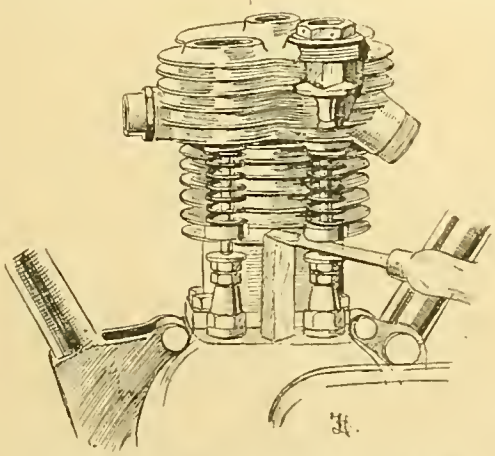
THIRD INSTALMENT.

OVERHAULING.

OBVIOUSLY the question of overhauling can only be dealt with in the briefest and most elementary manner, as to treat the subject at a fully would require a good-sized book.

How to Mend Punctures.

Possibly the puncture fiend will be the first to attack the rider, and though the repair of a tube is pretty generally understood, there are probably several tips that the novice will find useful. As soon as a tyre deflates, examine the valve, and if this is in good order carefully inspect the tread and walls of the tyre, searching minutely all the while for any substance which appears to have pierced the canvas. If any such puncture is discovered, carefully wipe the cover and then, mark the cover at the desired spot, and remove it for a foot or so only, to allow the tube to be examined. Feel inside the cover for any projection and remove it at once. Carefully clean the tube in the damaged spot, making sure that there is not more than one hole (a nail will often make one hole in the tread and several at the opposite side), and having cleaned the place or places, apply a good coat of solution and rub in well. Then allow this to dry while the patch is similarly treated (a good "prepared" patch is the best). The writer always treats both tube and patch twice, allowing them to dry well in each case. Then apply the patch and work all over it with the thumbs, making sure that the edges are stuck firmly down. It is as well to leave the patch to dry as long as possible before sprinkling a little French chalk round it and replacing. Slightly inflate the tube before refitting the cover, so as to prevent nipping, and so far as is possible roll the cover into place with the fingers. If the puncture cannot be located, it is best to remove the tube entirely and test it for leaks either with smoke or water. If there is no water present a slight leak can often be detected if the tube is passed across the lips or some sensitive part of the face.



Showing how to remove a valve spring in the absence of a special tool. The cylinder is shown sectioned, stripped of fittings and ready for removal.

Cleaning the Crank Case.

After every thousand miles it is a good plan to clean out the crank case, and the best method of doing this is to remove the drain tap in the crank case while the engine is still warm. Then remove the oil pipe. When most of the dirty oil has drained off, replace the drain plug and inject about a cupful of paraffin through the oil union; a small squirt should be used for this purpose. Close up the oil union and revolve the engine smartly by hand or foot for a short time, and drain the crank case once again. Now replace the drain tap and oil union and pump in three or four charges of oil and the operation is complete.

Removal of Carbon.

When the engine begins to lose power or show signs of knocking more than usual, it is as well to scrape the cylinder head and piston and attend to the valves. With proper lubrication and driving these operations will seldom be necessary, though with inexperienced driving they may be needed after the first 1,000 miles. The work is fairly simple, but it is better to have an expert motor cyclist as a supervisor on the first occasion. First remove the carburetter, sparking plug, valve caps, compression tap, and all external fittings of the cylinder, and carefully scrape all surfaces exposed to the explosion till all traces of carbon have been removed. Then undo the cylinder holding down nuts; one or two of these are often awkwardly placed, and require some patience before they are removed, and in extreme cases it may be necessary to remove the valves before they can be reached. For the present, however, let us imagine that the nuts have been successfully taken off. If the cylinder will not move easily it is best to bump it with a wad of rag over the hand. This will almost invariably free it, and does not damage the cylinder ribs. The cylinder should then be gently raised and the engine turned till the piston is at approximately its lowest point, when the cylinder should be able to be drawn off fairly easily by tilting it either backwards or forwards. As soon as this has been done, fill the inside of the piston with clean rag, so as to prevent it becoming damaged against the connecting rod, and then carefully remove all carbon deposit from the cylinder head with a long screwdriver or similar instrument. The piston head can be scraped with an old knife. Next remove the piston and scrape out the underside of the head.

To remove the piston the gudgeon pin must be withdrawn, and as there are many methods of fixing this part, it is best to consult the maker's catalogue or take the advice of an expert on the first occasion. This is especially necessary when dealing with a taper fit gudgeon pin.

Hints to Beginners.

The piston rings should be removed and cleaned, and the grooves in which they lie carefully scraped. The process of removal requires patience and delicacy, for the rings are made of cast iron and are very brittle. The writer prefers a single fine knitting needle, which should be placed under one end of the ring and worked gradually round. Meanwhile a gentle side pressure should be maintained on the ring to prevent it slipping back into its groove. Many prefer these strips of thin metal used in the same way, but left at intervals round the piston.

Treatment of the Valves.

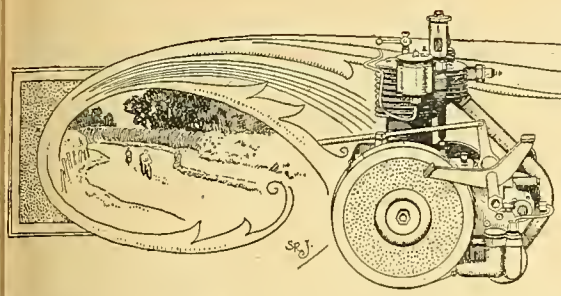
Valve grinding is comparatively simple, and the hardest part is generally the removal of the spring and cotter. It is best to place a cork, nut, or piece of wood on the valve head and replace the valve cap so as to keep the valve from rising; then lever the spring up (or depress it if the cylinder has been removed) until the cotter is exposed and can be taken out. The valve cap is then removed, and the valve and spring detached. There are many ingenious valve removers on the market which will save the rider much trouble, and it is as well to carry one suitable for the engine. The actual grinding should be done with very fine emery or carborundum powder mixed with oil, or one of the special grinding preparations now on the market. Coat the face of the valve lightly, replace the valve on its seating, and give it an oscillating movement with a screwdriver, raising and turning the valve slightly after every few movements. A light spring below the valve head will automatically raise the valve every time the pressure released. This process should be continued till th valve when clean is bright and without pits a round. Both cylinder, ports, and valves should the be thoroughly cleaned with paraffin, so that no trac of the cutting paste remains, and the engine is the ready for erection.

Putting Things Together Again.

There should be no difficulty about this if it carried out in the reverse order of dismantling, thoug care must be taken in starting the cylinder over th piston rings. It is best to oil the piston walls wi good cylinder oil and compress the rings as much possible with one hand while the cylinder is lowere and gently oscillated with the other. Never use forc or a broken ring will result. The joints in the rin should be placed as far out of line as possible, ar all faces, such as the cylinder base and crank case to should be scrupulously clean. If a new paper wash be needed for this part it can easily be made by hol ing a sheet of stout paper over the base of the cyli der and tapping the edges all the way round with light hammer. This should be done very gently avoid burring the edges. Before assembling, di mantle the carburetter and clean thoroughly wi petrol. Clean the outside of the magneto and exami your wiring for damage. Make certain that your ca buretter and inlet pipe are firmly fixed, and that the are no air leaks, and when bolting down the cylind tighten all the nuts gradually and evenly, and *nev* bolt one down tight and then begin on another.

THE MOTOR CYCLE AS AN AID TO RED CROSS WORK.

The above photograph shows how motor cycles can be utilised in conjunction with Red Cross work. The men depicted are members of the Twenty-fifth Company London Cyclists. The doctor calls up a motor cyclist orderly, and sends off particulars with instructions for base hospital.



Handling a Chain-driven Machine.

By ROAD RIDER.

IN the old days it was frankly recognised that a rigid transmission threw specially heavy strains on all the mechanism, and chain-driven machines were generally constructed with unusually heavy frames and fittings, and in particular, the engine was of a heavier and sturdier type than was adopted for the belt drive. Nowadays the craze for "revs" has produced a host of chain-driven machines with fittings as light and engines as lively as any ever incorporated in belt-driven machines. One may say that the early chain driver was always reminiscent of a dray horse, and the belt-driver of an Arab. Now the modern chain driver is usually of Arab breed.

Easy Pick-up Desirable.

Two small tips will enable the rider who has recently made the transition from belt to chain drive to obtain the best results from his new mount.

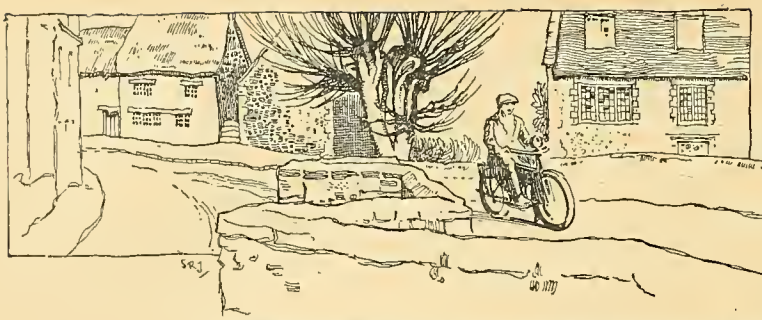
The first is to ease the pick-up of his engine whenever possible. In driving a belt-driver one feels a certain pounding and labouring either in getting the engine to pick up after an acute corner, or in coaxing it to accelerate on a stiffish gradient. On a chain-driver these sensations are exaggerated to an absolute "snatch." The makers of some three-speeded chain drivers implore their customers to change on to second gear under such circumstances, whereas with a belt-driver one would only shut off a little air or retard the ignition a trifle. Personally, I should not change down save under exceptional circumstances. If the snatch struck me as genuinely excessive, I should dismount, and adjust the clutch on the soft side. Under ordinary circumstances I should slip the clutch a little till the engine picked up. If a stiffish grade followed a sharp corner, or if the gradient were such that a belt-driver of similar horse-power would need much coaxing to hold on to top gear, I should emphatically change down. The results of abuse are serious. The engine takes the first strains, and there is no belt slip to ease its bearings; bad driving will, therefore, produce worn big end bushes in a very short distance. If the engine is really substantial it will pass the strains on to the transmission: then the weakest points in the chains will commence to give, and the pitch will suffer, or the spring link will weaken and finally snap. Therefore never let your engine "snatch!" Either (a) adjust the clutch less tightly, (b) slip the clutch a little in picking up, or (c) change to a lower gear.

The Effect of Vibration.

The second point concerns engine racing. There are few sensations more pleasant than those of letting the engine "rev." wildly, especially when one is putting a big car through it on a hill, and getting rid of its dust. Racing an engine, even under load, is never very wise practice; it entails far more wear than hundreds of miles of steady running. Racing the engine with a belt drive transfers a lot of vibration to the machine, and is responsible for many petty troubles in the way of lost bits. But racing a chain-driven engine, especially on the lower gears or in neutral, is absolutely suicidal. The racing of a belt-driven engine invests the machine in an atmosphere of vibration by sympathy; but the slip of the belt is pronounced at such times, and saves the machine from any very direct and intimate transference of oscillations. The rigid drive of the chain, on the contrary, transmits every single vibration to the very marrows of the mechanism, and is calculated to loosen every nut and bolt on the machine. I have lost tank fillers, crank case plugs, saddle nuts, and many other things by this kind of misbehaviour.

This accounts for the not infrequent grumbles one hears from first time owners "that chain drive shakes everything loose." The rigid drive requires more sympathetic handling, but, given that, it is eminently satisfactory, especially when properly encased.

A good example of a chain-driven machine. The 5-6 h.p. Clyno in military service.



LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Dissolved Acetylene.

Sir,—Like "Ixion," I believe in luxuries, and hate carbide, generators, and everything pertaining thereto. Therefore I use D.A. But I cannot agree with him that the cost is only slightly in excess of that of running a generator. If "Ixion" regularly obtains twenty-four hours light from his six cubic feet, he must be remarkably lucky in getting hold of good cylinders.

The utmost light I have ever obtained from a D.A. cylinder is eighteen hours, and in my experience ten to twelve hours is more common, whilst on two occasions the gas has "conked out" after about five hours, and I have had to resort to tallow candles tied to the burner of my lamp to get home. I may use a slightly larger burner than "Ixion," but cannot imagine that it is big enough to make all this difference, and I am always careful to see that there is no leakage, five hours costing 2s. 3d.!

In spite of this I stick to D.A., as the convenience of having the gas always—or nearly always—"on tap," when one only goes out for perhaps an hour or so in the evening, must be experienced to be appreciated. I get my luxury, but I have to pay for it. NOCARBIDE.

Motor Cycling in Bagdad.

Sir,—Thinking it may interest some of your readers hearing of motor cycles in out of the way places, I pen this short description of the advent of motor cycles in Bagdad and district.

My firm brought out the first machine during the early part of last year, and this I rode for two or three months with great success, and to the surprise and joy of the Arabs, who even now hail their approach with shouts of "*Chemin de fer.*" It was afterwards sold to a resident here, who rode it regularly until about two months ago, when both he and a rider of a similar machine had accidents to their respective mounts when on a ride to Remady, a place on the River Euphrates, about seventy kilometres distant. More of this town will be heard of later, as a regulator is being built there in connection with the new Barrage just recently opened. This directs the river again to its original channel, past Babylon, opening up a rich tract of land which has not been cultivated for many years owing to scarcity of water. The machines were 2 h.p. Humbers. Their riders lost their way, and on riding up what appeared to be a piece of rising ground, it turned out, to their great surprise, to be the bank of an ancient dried up irrigation canal. They were unable to stop, an entirely unrehearsed acrobatic display took place, they and their machines being precipitated an estimated drop of fifteen feet. Fortunately, with the exception of slight bruises, they were unhurt. The machines suffered, the wheels of one being ruined and the front forks of the other smashed. They were able by changing over the broken and bent parts to get one machine in running order; the other had to be brought back in a carriage. We have now in Bagdad six 2 h.p. Humbers, a twin N.S.U, and sidecar, a two-stroke Radco, a 2¾ h.p. Wolf, and a four-cylinder F.N. It is quite on the cards that a motor cycle club will be formed this autumn. Our daily shade temperatures are anything up to 120° F. Overheating is one of our troubles, and I wonder if any reader will tell us of his experience with the new aluminium radiators? I think this is a fine place to test their efficiency. Just now one feels that a benefactor to European residents here would be the invention of a radiator to fit on one's own body. H. N. NEAL.

Bagdad, Asiatic Turkey.

A Double Purpose Machine.

Sir,—If I may be allowed to give my own view on this subject, I will confess that I do not agree with "10,000 Miles a Year."

I consider that the Scott is the ideal machine for both solo and sidecar work.

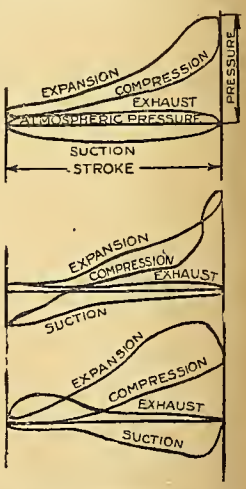
It is considerably more powerful than a 3½ h.p., and, owing to its water-cooling, never overheats, yet its well-balanced engine allows easy control in traffic and good speed in the open, as the last four years' T.T. Races have shown.

May I add that "Ixion," in his appeal in the issue of the 3rd September for 500 c.c. spring frame machines, seems to have overlooked the A.B.C. and Indian.

A. STATHAM.

Indicator Diagrams.

Sir,—From time to time articles are published on the subject of tuning up, and seem to me to be governed mostly by "rule of thumb." With all other reciprocating engines you hear of an indicator being used to show what is happening inside the cylinder when the engine is at work, but I have never heard of this instrument being used on small internal combustion engines. I should think this instrument would be of great use when tuning up, as it shows exactly what the valves and spark are doing, and would show exactly when the valves were opening and closing and when the explosion occurred. I give a few sketches herewith, which give some idea of what a card from one of these instruments is like.



The top diagram is normal; the second shows pre-ignition—the inlet closes too late and the exhaust opens too early; the third shows a number of faults—the inlet opens too late, the exhaust opens too late, and the spark is also late. From these it will be seen that it would locate most of the troubles to which this kind of engine is subject. There might be some trouble with it, due to the high speed at which motor engines run, but I think it could be overcome. I cannot give any result of a practical nature as I possess no motor to experiment on, but hope to join the ranks soon. Perhaps someone who has had experience of indicators could give some information.

With apologies for the length of this letter,

INDICATOR.

[As long ago as May 2nd and May 16th, 1904, *The Motor Cycle* had articles on indicator diagrams, taken from a motor cycle engine. Experiments in this direction were carried out by Professor Callender of the Central Technical College, South Kensington. If our correspondent desires, we shall be willing to place our files at his disposal if he calls at either the London or Coventry offices of this journal.—ED.]

Motor Cycles Wanted.

Sir,—Will you publish this letter, in the hope that some patriotic firm who desire to have their machine thoroughly tested as a military motor cycle will come forward and offer the loan of machines for the duration of the war?

There is on the War Office establishment for cyclist battalions no provision for motor cycles for the use of officers. The duty entails upon at least three officers in each battalion a tremendous amount of patrol work. The officers in question, in addition to their ordinary work, which is already sufficient tax upon their time and mental energy, find themselves obliged to cycle fifty or sixty miles more than any of the men. They have already given up so much for their country that they cannot well afford to purchase motor cycles at the present moment in order better to perform their duty.

It seems to me that some of our motor cycle makers might wish to help, and at the same time secure not only a good advertisement for themselves, but a thoroughly efficient test of their machines by men whose opinion, as experts, should carry weight.

ALBERT H. TRAPMANN,
Captain London Cyclist Battalion.

[It is obviously the duty of the Government to see that its military units are properly equipped with motor cyclists. The Government goes to the extent of purchasing machines for special branches of the Service, such as the R.E. Special Reserve, the Intelligence Department, the Army Service Corps, etc., and though we do not suggest that motor cycles should be provided for all the Territorials, it is obvious that the officers of the cyclist battalions should be equipped with power-driven machines. In default of this, however, we sincerely hope that some patriotic manufacturer will serve his country by offering to place machines at the disposal of our correspondent (and his colleagues), whose work for the military motor cyclist has been most strenuous from the beginning of the movement.—Ed.]

An Ideal Lightweight.

Sir,—I am not yet a motor cyclist, but I have a fair knowledge of motor cycles, gained partly from friends and partly from your excellent paper. The idea of writing this letter came to me after reading some little time ago an article in which the writer expressed his opinion that the ideal machine for solo riding would be a combination of the Scott engine and frame, and the F.N. shaft transmission. For a long time I have thought that a splendid lightweight might be built on similar lines. Nearly all present lightweight machines have belt drives, the troubles from which are well known; a few have chain drive, which is a better system of transmission, but open to two objections—either the chains need frequent cleaning, or, if they are enclosed, the rider lies in fear lest they should stretch or break.

The two-stroke engine is fast coming to its own in spite of prejudice and conservatism, but it requires some manufacturer to strike out from the beaten track, just as did Mr. A. A. Scott when he introduced his famous machine. I should like to see a lightweight introduced, comprising the splendid Scott frame, a single cylinder, air-cooled, two-stroke engine of 2¾ horse-power, driving, through a change-speed gear box, by shaft to the back wheel. The machine should not be unnecessarily lightened, as many of the present small machines are far too light for comfort. The 2¾ h.p. engine would give ample power to drive the heavier machine, and a sturdy, stable mount would result, costing, perhaps, more than the average lightweight, but well worth the extra money.

I am looking forward to a description of the coming Scott lightweight, and hope that the firm's originality will still be apparent in the new production, although, of course, I can hardly hope for the shaft drive. I have no interest in the Scott Co., except the interest which everyone feels for successful enterprise, but the Scott frame seems to me most suitable for a two-stroke, shaft-driven machine—the engine flywheel being, of course, at right angles with the frame.

It may be urged that with a single-cylinder, shaft drive would be harsh, but surely, if the 2¾ h.p. four-stroke F.N. drives sweetly, one would expect a two-stroke of similar power to be even better.

NORMAN WILLIAMS.

The Motor Cycle in Siberia.

Sir,—Having noticed from time to time interesting snapshots from Colonial riders in *The Motor Cycle*, I send you two of my machine, which is a 3½ h.p. two-speed Calthorpe three years old. It stands up to the rough going wonderfully well. We have also a 3½ h.p. three-speed Rover, which arrived a month ago. I believe our nearest neighbour with a motor cycle is four hundred miles away or nearly. We are stationed two hundred and fifty miles from the railway. Riders at home might be interested to hear we have no suffragettes, no number plates, no silencer regulations, and no speed limits. (The roads themselves are our speed limiters.)

Congratulating you on your excellent journal,
Siberia, Russia. NORMAN G. LOVELL.

[The above letter though dated July 17th only reached us last week.—Ed.]

THE MOTOR CYCLE IN SIBERIA, WHERE THE ROUGHEST ROADS ARE ENCOUNTERED.

Showing summer quarters and open air garage. Crossing the Koomoola River.

Three military riders of Rudge-Multis. They are members of the Scottish Cable Signal Company R.E.

Advice from the Front.

Sir,—Your edition of August 20th just to hand, and I might say very acceptable.

As one of the volunteer motor cyclists attached to the Expeditionary Forces, my advice to all motor cyclists on the various waiting lists is: (1) Perfect yourselves in map reading—it will be very useful to you and your Government; (2) look up your French—you will require a knowledge of it; and last, but not least, get it into your heads that when you have been accepted for service and go to your depot *you are no different* from any of the other non-commissioned officers; you are as subject to the rigid discipline of the Army as if you had earned the two stripes you should proudly wear, which in the ordinary course takes a man in the Royal Engineers about eight years.

You will find the officers and non-coms. very ready and willing to help you in every way, and give you any advice you require. You may know more about a motor cycle than they do, but they know more about the discipline that is absolutely necessary if you want to be of any use to your King and country. ALFRED JACOBS.

Base Signals, Expeditionary Force.

Married Men and the War.

Sir,—I am pleased to see in your leading article of last week a word in defence of the young unmarried man who, for business, or domestic reasons, has not offered his services for the Army. Considering the many scathing and often brutal comments that have been written in prose and verse during the last week, concerning those who have not enlisted, it is difficult to estimate which is the greater coward—the man who joins the Army or the man who stays at home. The latter, whatever his position may be, is constantly reminded that many of his less able-bodied brothers are fighting for the cause of their country; the arm-chair critic in the club-room is seldom slow in giving him a rub about it, while the married man he meets in the street greets him with the remark, "If I were not married I would have gone long ago."

There are thousands of young unmarried men in the country to-day to whom it is a far greater sacrifice to remain at home than it would be to enlist, and who are in every way as loyal as those who have already laid down their lives for England's honour. It is these young men who feel most keenly the criticism to which the non-enlisting manhood has been subjected, while the real shirker, the nonentity for whom these scathing remarks are intended, is not sufficiently susceptible to take any sort of written criticism to heart.

Further, I think it is a moral sin for married men, and those on whom labour is dependent, to volunteer their services—for the present, at any rate. Numbers of men have been thrown out of employment by the war, and must now look to the Army for a living. Again, the majority of the big business houses are doing all in their power to induce their young men to enlist, and, in most cases, have promised to keep their posts open. These are the men who must go to-day—must consider it their sacred duty to do so, if only to spare those on whom families and important industries are dependent.

Personally, I cannot enlist at the time being for reasons which there is no need to state here; but, like thousands of others, I am willing to sacrifice much for the support of the nation in this great crisis. That I should be classed among the shirkers, funks, and idlers is beyond endurance. If it becomes necessary for me to go, Lord Kitchener will doubtless issue an appeal, the meaning of which there will be no mistaking, and when that day comes I think that not only the unmarried men of the country, but the young married men also will be called. Then, I will gladly take my place among those who are making a sacrifice, a thousand times greater than the men who, in response to the first call of duty, are joining the Army to-day.

ONE OF THE THREE MILLION.

[Though we publish this letter as there is doubtless force in the remarks, we desire it to be known that no remarks of ours have excused young unmarried men from enlisting.—ED.]

The Storm Kit Question.

Sir,—It is with much pleasure that I notice that "Ixion" has taken up the "storm-kit" question.

In the old days I remember reading in "Occasional Comments" that snow shoes were a *sine quâ non* in rough weather when the ordinary trouser overalls were worn. I mention this because I intend referring to it later on.

As regards the cost question, the price of leather-soled Hutchinson waders is 17s. 6d., and that of the Moffat Poncho (the only objection to which being that the standard model thereof has no pockets) is 15s.—32s. 6d. in all.

Now, to come to the ordinary overall suit. Allowing 6s. 6d. for a pair of snow shoes, this would only leave 26s. for the overalls. Of course, we all know that quite decent overalls *can* be bought for this figure; but even supposing they are absolutely waterproof to start with, for how long will they remain so? Even the best overall trousers in conjunction with snow shoes are nothing like so efficient as Hutchinson waders in really bad weather, and, after all, Hutchinson waders are very quickly donned. Continental gloves I have found absolutely splendid. They are rather costly in the first instance, I admit, but are really cheap in the long run. Personally, I have had one pair in use for ten months, and, like Johnnie Walker, they are "still running."

As regards the leather racing helmet, perhaps "cap" would be nearer the mark than "helmet," as I did not wish to imply the padded or pneumatic variety. The one I now have I got at the Service Co., and it has been both useful and extremely comfortable. It weighs under 3 oz.

Except for long runs in the winter, puttees as well as the Hutchinson waders are really unnecessary. Leaving puttees out of the question, I do not think the kit I advocate tots up to so very much more than that of "Road Rider."

I have not taken any statistics, but I should imagine that nearly everybody in a six days trial sports Hutchinson waders, and I have also seen a goodly number of riders garbed in oilskin ponchos or oilskin coats, and when all is said and done the six days trials—English, Scottish, and International—are all held in the summer. MOR 425.

The Bristol M.C.C. recently held a run to Porlock, under the auspices of their War Committee, with a view to testing the suitability of motor cycles for military purposes. The view shows the scene in Porlock village.

"SUNSTONE" for machines up to 8 h.p. A good anti-skid and unrivalled for heavy work. 26×2¼ 40/- 26×2½ 45/-

"COMBINATION"—the enduring Non-skid (steel studs and rubber bars). 26×2¼ 48/3. 26×2½ 50/-

"STONEHENGE." Same design as "Combination," but all-rubber tread. For machines up to 4 h.p. 26×2 20/9. 26×2¼ 22/6

"TRICAR" for tricars and machines up to 5-6 h.p. Rubber studs. 26×2¼ 35/- 26×3 45/-

"DRUID" for sidecars and lightweights. Hexagonal rubber studs. 26×1¾ 15/9. 26×2 17/6

His Majesty's Service demands good riders—good machines—good BRITISH tyres...

Good tyres and Avon Tyres are synonymous terms. Equip with British Avons because they cut down potential misfortune and delay to the irreducible minimum.

A "Combination" on the driving wheel and "Sunstone" or "Tricar" on front or sidecar wheels will take you over anything, with any load.

OCCASIONAL COMMENTS by "IXION"

The Sturmey-Archer Countershaft Gear.

I am very glad that at least one leading hub gear concern is sufficiently open-minded to realise the prospects of the counter-shaft position, and sufficiently enterprising to enter a market which it previously regarded as antagonistic. The efficiency and reliability of the cheap and compact three-speed hubs represent one of the most brilliant engineering feats yet accomplished in the industry, and their makers must know more about the design and material essential to light and compact gears than anybody else. Now that they are catering for both demands, the two types of gear will be able to fight their battle for supremacy on level terms, and I have no doubts about the ultimate victor, though the hubs still retain a long and honourable career in the future.

Speedometers.

Timidly I return once more to my sorest subject. For some years past I have remained tolerably faithful to two leading makes, and I rashly fancied that all others were of equal quality. During the present season I have sampled eight or ten different makes, and without doubt there are great variations in the accuracy of their readings and the steadiness of their needles. The Cowey and the Watford I have always found trustworthy and steady, and I can now add the Bonniksen Isochronous and the A.T. to the roll of honour. Words cannot do justice to the eccentricity of one or two other makes which I have tested. As one maker said, "You may find you can only do forty by our instrument, but you will pass most other instruments when they are registering fifty!" I found he was right, and a stop-watch soon proved that his instrument was right, too.

Dissolved Acetylene.

So far as present developments go, electrical outfits are surely being overlauded a trifle! I am among those who consider that electricity is likely to vanquish all its existing rivals in the way of power providers, but I am not so sanguine as to think its triumph can come by to-morrow about this time. So far as engine-starting is concerned, the defects of the kick-starter are not so pronounced that great additions in either weight or cost will be faced to secure the greater luxury of electricity. A dynamo, with a pair of good and capacious accumulators, can hardly be kept under a total of 50 lb. as yet, and the reduction of this figure to 30 lb. will be a long and tedious job. A kick-starter and a mechanical horn can perform two of the functions designed for a complete dynamo outfit almost as efficiently, and weigh little more than the inevitable corresponding appurtenances of an electrical outfit. When it comes to lighting, a cylinder of dissolved acetylene weighs but 6 lb., and costs much less than the electrical kit; further, it has the advantage of being absolutely reliable. A cylinder of these dimensions provides sufficient illuminant for eight long evening rides, or for two big lamps on a double-journey Edinburgh ride. The sole defect of the compressed acetylene cylinders is that they are not very handily storable on a solo mount, but this could easily be overcome if makers would provide a carrying socket. On many machines they can be housed along the saddle-pillar tube on the offside. The steadiness of the flame they provide, and the absolute freedom from lamp trouble which they ensure throughout the longest night trip, is a positive revelation, and compares very favourably with the fear which haunts a novice when seated over the mysteries of a dynamo, on which his progress is entirely dependent.

Artillery Wheels—A Side Issue.

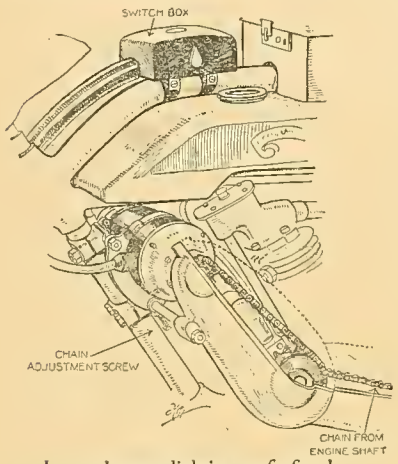
The experimental artillery wheels used in the Scottish Trials this summer hardly covered themselves with glory, for the judges' inspection revealed plenty of cracked spokes, but initial weaknesses accompany every innovation, and are negligible. In every direction there is a strong movement towards improving the cleanliness of motor cycles, and artillery or disc or disc-encased wheels are obvious leads in that direction; one may suppose that either disc or artillery patterns should become standard in course of time. Such a change will exercise a strong influence on both transmission and brakes. Belt rims will spoil the neatness of either type, and would indeed be intolerable on any model of disc wheel. Therefore, the general adoption of internal expanding brakes seems probable, and a marked pointer is offered in the direction of shaft or chain drive.

R Reid of Aberdeen on his 1914 counter-shaft geared Zenith sidecar. He reports that he takes long runs during week-ends, in the North of Scotland, always with five up, and has never yet experienced any difficulty on hills

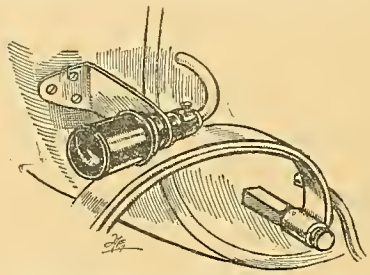
An Electrically Lighted Matchless.

A Last Touch of Refinement to a Luxurious Sidecar Outfit.

MESSRS. H. Collier and Sons, Ltd., of Plumstead, have added one more luxury to their already famous Matchless sidecar combination in the form of a Lucas electric lighting outfit. The generator is mounted in a very accessible position above the magneto, and is held by means of a specially designed bracket to the rear down tube. This bracket is so constructed that it can be fitted without any alteration whatever to any existing 1914 machine. The drive is by means of a chain operated by a sprocket on an extension of the magneto-shaft, and a casing is provided which totally encloses both the dynamo and magneto chains. An adjusting screw is provided at the bottom of the bracket by means of which the chain can be adjusted to the correct tension. This is also quite well placed, and can be got at quite easily with an ordinary spanner. The end cover of the generator can also be removed without any obstructions, so that it is quite an easy matter to remove the brushes for cleaning or other purposes. Placed on the top of the tank and attached to the top tube is the Lucas switch, which is an extremely ingenious mechanism and very effective in action. The wires from the dynamo are taken through a hole in the side of the sidecar body to the accumulators, which, in their turn, are housed underneath the seat. Other wires are also taken from the battery to a lamp neatly positioned at the rear, and a small sidecar lamp stationed on the near side of the body, but at the front.



Lucas dynamo lighting outfit fitted to a 7 h.p. Matchless.



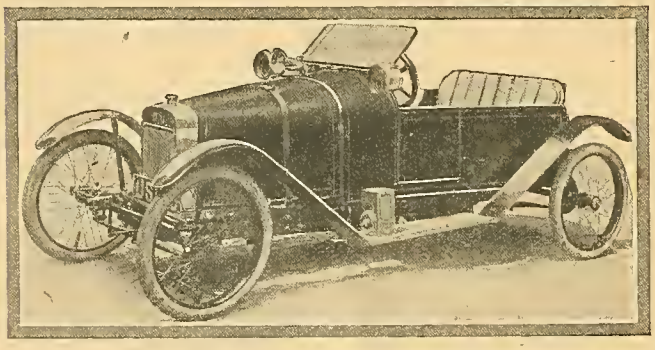
Method of fitting rear lights in connection with the Lucas dynamo lighting outfit.

The whole job has been carried out with great care, and both the fitting and type of lamps provided are highly commendable. The gearing allows the generator to cut in at about twelve miles per hour—an advantage when much traffic riding is performed.

The D'Ultra Cycle Car.

A Simple Machine incorporating Friction Disc and Single Chain Drive.

FOR some time now Mr. Harold Dew has devoted much time and study in evolving a cycle car which can hold its own with the reliable sidecar combination which is so popular at the present time. His latest type savours very much of high-class automobile practice, but, at the same time, simplicity has been kept in view throughout. The frame is made of reinforced ash, and is of quite simple design with only three cross members. The engine utilised is a twin-cylinder Chater-Lea with a bore and stroke of 85 mm. × 85 mm., and is water-cooled. The water is contained in a tubular radiator, which has a very neat appearance in conjunction with the tapered bonnet. The transmission is by propeller-shaft to which is attached a friction disc driving a counter-shaft, whence the power is transmitted finally to the solid rear axle by means of one roller chain. This type of drive, although simple, is very efficient, and is, at the same time, light and cheap to make. The gears, of course, can be varied infinitely between two points, which is a great advantage in light vehicles with engines of moderate horse-power. The rear axle is mounted in bearings housed at the end of the cantilever springs, which are very effective in action. The front spring is of the transverse half-elliptic pattern, and, in conjunction with the rear springing, allows the weight distribution to be taken up very evenly all over the chassis. The steering gear is of the rack and pinion type, which is used on a number of vehicles of this description, and has always proved itself to be thoroughly satisfactory. Two brakes are embodied in the rear wheels, and are respectively internally expanding and externally contracting.



THE LATEST D'ULTRA CYCLE CAR.

The neat taper bonnet and radiator and transverse underslung front spring will be noticed.

The good points of this cycle car are many, and chief, perhaps, among them is its excellent value for the money asked for it—viz., £115, complete with two head lamps, hood, and wind screen—which ought to make the vehicle a sound commercial proposition, as it is extremely comfortably to drive and handle. Its low centre of gravity renders it very stable.

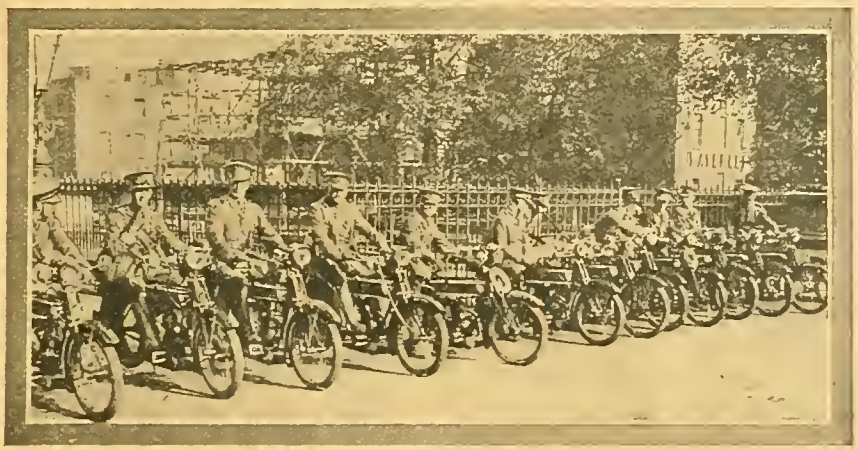
Motor Cyclists for the Intelligence Department.

A New Branch of the Army to Provide Mobile Interpreters.

LAST week we inspected a detachment of twenty-one motor cyclists who were leaving for the front for work with the Intelligence Department. The detachment was raised by Major L. Sandwith, 8th Hussars, while in command is Captain Blackburn. All the members of the detachment had to speak French and German fluently, and before being accepted by the War Office were examined orally by the Civil Service Commissioners in these languages, and, on being passed, were given £20 for the purchase of their kit and were gazetted with the rank of lieutenant. An extraordinary amount of kit was carried, which made the luggage carriers appear to be of much too small dimensions.

The Well-equipped Machines.

The machines are the very latest pattern Rudge-Multi, equipped with Lucas lamps and generator, and Jones speedometers registering in kilometres. All machines are finished in black and are fitted with handle-bar mirrors. The full list of spares required by the War Office on active service is, of course, carried. The tyres are ribbed pattern Dunlops. The kit consists chiefly of a large Willesden canvas holdall, a big hand-bag, and a knapsack. The usual arrangement is to place the bag on the carrier, put the holdall over it at right angles, and strap the knapsack to the back, over the rear number plate. The men were enthusiastic to go to the front, and, undoubtedly, they will have a most exciting time, as working for the Intelligence Department they will be up in the front, and at times even beyond it. We heard that General French had asked for several of these men early last week, and we were able to supply the War Office with quite a number of names of those on our register who were linguists. In conversation with one man, he told us that he thought the examination for languages was very much too easy. Unfortunately many of the men had had little motor cycle experience. However, as the corps was raised rather hurriedly, this can scarcely be wondered at, as it is not easy at a moment's notice to raise even a comparatively small number of expert motor cyclists endowed with the necessarily high qualifications demanded.

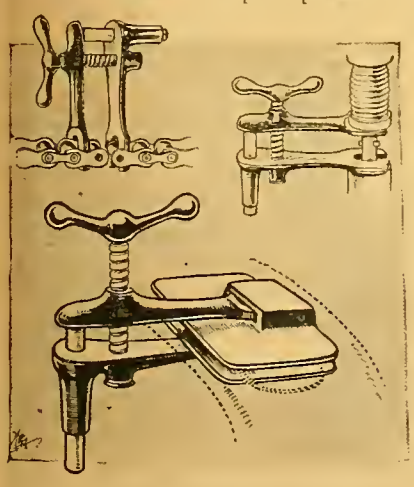


Some of the members of the motor cyclist corps for the Intelligence Department of the War Office, which has just been raised. These riders all speak French and German, and have been gazetted to the rank of Lieutenant. All are mounted on 3½ h.p. Rudge-Multis.

AMONG THE ACCESSORIES.

A Useful Tool.

IN our issue of April 2nd we shortly described the Smithowen valve lifter, which has since undergone some improvement. The accompanying sketches also show several methods in which it may be employed to bring the ends of a rather tight chain together, and also, with the aid of a couple of plates fixed over the fork ends, it acts as a tyre patch compressor, in which capacity it should prove very useful. The makers of the Smithowen valve lifter are Messrs. A. S. Smith and Sons, Charles Street Works, Walsall.



The sketch in the top left hand corner shows the chain tightener, that on the righ the valve spring compressor, and the lower one the tyre patch compressor.

The Crown Counter-shaft Pulley.

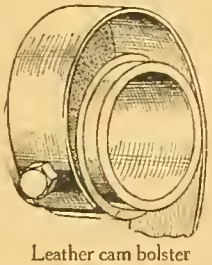
Messrs. Lee Bros., 9a, Ada Road, Havil Street, Camberwell, have placed on the market a variable pulley which is intended to take the place of pedalling gear, and to convert a single belt drive into a combined chain and belt transmission. An eccentric adjustment is provided, and the outer flange of the pulley can be screwed in and out as required, half a turn or more at a time, when a small bolt has been removed; a spring clip prevents this bolt from working loose.

Aluminium Soldering.

We receotly had an interesting demonstration of aluminium soldering carried out by a representative of the Croydon and District Model Aero and Engineering Co., 3, Wellesley Parade, West Croydon. The solder, which is composed of tin, aluminium, silver, etc., works very well, and can be applied with an ordinary clean bit from which all trace of solder has been removed. To solder two pieces of aluminium together it is necessary to clean the surfaces until they are absolutely bright, place the stick on the clean portion and apply the iron to it. It should then be rubbed up and down until the faces are properly "tinned." The solder runs quite smothly, and when both surfaces have been treated one may be placed over the other and the iron applied to the top and round the edges, when a good solid joint can be obtained.

A Philipson Pulley Alteration.

A small but nevertheless important improvement has been carried out on the latest form of the now well-known Philipson pulley. It consists of what is termed a leather cam bolster, which is fitted below the smallest diameter spring coil at its point of attachment to the central member. This apparently small taper leather pad has a very useful effect in that it practically prevents spring breakage, even under bad treatment, and also imparts a very smooth action to the pulley. All new pulleys are fitted with this device and existing types can be converted. Three stamps, to cover postage, if sent to the makers at Astley Bridge, Bolton, Lancs., will bring the necessary parts, but it must be remembered that the washer under the present fixing screw should be left out.



Leather cam bolster as fitted to the latest type Philipson governor pulley.

The Dearth of Magnetos.

A correspondent writes: "In the light of your recent enquiries, may it not be said that the talk of a dearth of magnetos is pure bosh?"

The Commercial Sidecarrier.

The sidecarrier promises to enjoy a big vogue in the near future, as leading business houses are adopting it. Incidentally, a number of new firms are taking to its manufacture.

Second-hand Market Good.

From actual experience the second-hand market for motor cycles is quite brisk. Two members of our staff who advertised their machines for sale in the columns of this journal disposed of their mounts after the first appearance of the advertisement. Furthermore, enquiries have continued to arrive from prospective buyers.

Another British Magneto.

Still another British magneto is announced, and an illustrated description of it is given in another part of this issue. Motor cyclists in general will hail with delight the arrival of the C.A.V. magneto, especially as the Rudge-Whitworth and B.S.A. companies are expecting early consignments of this latest British instrument.

Motoring Centres in the War.

Two small towns which are appearing daily in the papers at the present time, Chateau Thierry and La Ferté Sous Jouarre, also Soissons and Compiègne, were traversed in the A.C.C.F. Circuit de Paris in 1912. Chateau Thierry is, of course, famous for its hill, which, however, does not now offer any difficulties to the riders of motor cycles.

Off to the War.

We learn that F. P. Mayell, captain of the Sutton Coldfield and Mid-Warwickshire A.C., has rejoined the regiment with which he went through the Boer War, and has left Birmingham for the front, and that J. St. John, trials hon. secretary of the same club, volunteered as a motor cyclist on August 6th, and expects to be called up for service shortly.

A Rally of Non-military Motor Cyclists.

At a preliminary meeting of motor cyclists held at the Victoria Hotel, Wolverhampton, it was unanimously decided to form a non-military motor cycle body. It was further resolved to call a rally of motor cyclists on September 27th, 10.30 a.m., at the Talbot Hotel, Wolverhampton, to proceed afterwards to Penn Common, when the objects of this body will be fully explained.

Too Fast for the Foe.

In the *Daily Mail* the other day we noticed a letter from Corporal Graham Hobson, R.E., who is in a motor cycle section of the Expeditionary Force. He states that he is in command of a section of ten men, nearly all of whom were educated at the University, while one of them got his half-blue for running. The other day the latter was being chased by some German infantry when his motor cycle broke down and he had to run. He simply left the Germans standing over a half-mile over rough ploughed land. So far only one of the section has been seriously wounded. The corporal goes on to state that he feels very fit, and is enjoying himself immensely. All lights are put out at eight o'clock, and they lie in their blankets and tell each other lies about the number of Germans they have shot and the hairbreadth escapes they have had.

SPECIAL FEATURES.

NEW BRITISH MAGNETO.
OVER THE ROOF OF LAKELAND.
A DASH FOR LIBERTY.

Brooklands Open as Usual.

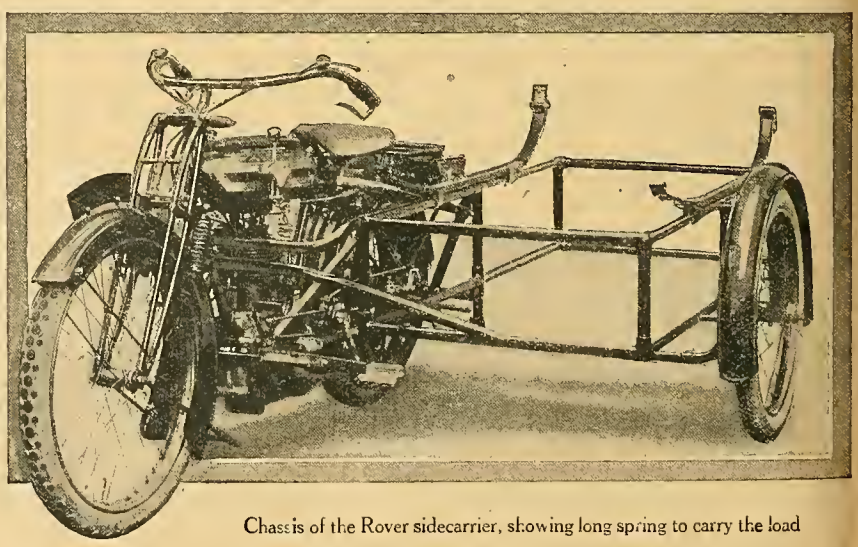
Although the September meeting of the B.M.C.R.C., which was down to be held on Saturday last, was abandoned, members are reminded that the track is available for use as in normal times.

F.N. Works Safe.

We are glad to be able to state that the F.N. Works at Liège have not been destroyed. Mr. Kelecom, the chief designer and one of the principals of the firm, is at present in England, and he has assured Mr. Gelder, the manager of F.N. (England), Ltd., that the works are intact and are being used as a German Red Cross Hospital.

The Rover Sidecarrier.

Last week we illustrated one of the 3½ h.p. Rover sidecarriers in use by the General Post Office, a noticeable feature of which is the method in which the load is supported on long springs. We now illustrate the cradle chassis, which clearly shows the springs in question and also the arrangement of the compensated brake for the back wheels.



Chassis of the Rover sidecarrier, showing long spring to carry the load

Motor Cycles for Russian Army.

We understand that Messrs. Phelon and Moore, Ltd., have been ordered to supply two hundred of their motor cycles to the Russian Government for military purposes immediately.

The Speed Limit.

There seems to be a fairly general opinion that the speed limit is in abeyance; we would warn our readers that this is not the case, though trapping is much less prevalent than usual.

Racing for the Belgian Relief Fund.

On Saturday next, at 7.30 p.m., some motor racing is to take place on Crazy Curran's Motordrome, White City. The proceeds will be devoted to the Belgian Relief Fund, and the meeting will be held under the patronage of H.E. the Belgian Minister. It is only fitting that one of the competing cars should be an F.N., made at Liège. This car will be driven by Mr. A. E. Gelder against a 30 h.p. automobile. Other events on the programme include a pursuit race, solo driving, trick driving, and neck-and-neck races, and, when one considers the smallness and trickiness of the track, a very thrilling entertainment may be expected.

Sport and the "Carry-on" Principle.

While the most varied opinions exist as to the propriety of continuing sport in its various branches, it is interesting to read the reply of the War Office to the Football Association's letter as to whether the continuance of the League matches would interfere with recruiting or be viewed with disfavour by the authorities in Whitehall. The War Office sees no objection whatever to the carrying out of the F.A.'s programme, but suggests that a portion of the "gates" should be set aside for the benefit of soldiers' dependents, and, further, that when a large crowd was gathered together the F.A. should seize the opportunity of bringing the need the country has of men before the crowds in a prominent manner.

The T.T. Winner on Service.

We understand that Cyril Pullen, who won the Senior Tourist Trophy Race this year on a Rudge-Multi, is now serving as an air mechanic in the Royal Flying Corps Sub-depot, Sheerness. A large number of well-known competition riders are acting in the same capacity.

An Entirely New Model.

Continuing its first descriptions of new model motor cycles, *The Motor Cycle* is this week able to provide its readers with the first particulars and photographs of the new two-stroke Singer machine. The new all-British C.A.V. magneto and the Dixie magneto for two-strokes are also described.

An Enlistment Opportunity.

Special facilities are granted to motor cyclists, and highly educated men connected with the motor cycle industry, to join the special battalion of Colonial Infantry now being recruited under Mr. Arthur du Cros, M.P., and Mr. Norton Griffiths, M.P., at the White City. Special opportunities to friends to serve together will be given. Applications to join should be made to either of the above-named gentlemen at the Uxbridge Road entrance to the White City.

A Recruit Heavily Fined.

We were glad to be able to record recently that in Surrey many summonses against motorists, who had gone to the front, were withdrawn by the authorities. On the other hand very different treatment was meted out to M. J. Stretch at Burton-on-Trent last week. Stretch, who was accused of dangerous driving, had enlisted in the North Staffordshire Regiment, and consequently could not defend the case. He was fined £5 and £3 6s. costs, or two months' imprisonment, and in addition his licence was suspended for six months. It is, however, only fair to say that the police stated that Stretch had been previously warned and many complaints had been made against him. Still, we think, under the circumstances, that some leniency might have been shown.

English Machines for Belgian War Office.

The Belgian Government last week placed an order with the Enfield Cycle Co. for fifty 3 h.p. Enfield motor cycles for the use of despatch riders.

The Sidecarrier.

A name given by *The Motor Cycle* on August 20th when describing three commercial sidecars and pointing out their possibilities, is being generally adopted. The commercial sidecarrier is catching on, as we predicted would be the case; live agents in the large centres are demonstrating it to tradesmen. Ever since *The Motor Cycle* a month ago first drew the attention of manufacturers to the opening for sidecarriers among bakers, butchers, grocers, who had been rendered horseless owing to the war, the movement has gained ground, and each week the subject has been dealt with in the columns of this journal.

The Awakening.

FROM A CONTEMPORARY, SEPTEMBER 8TH, 1914:

"Whereas in London one sees hundreds of men in khaki, in Coventry one hardly ever sees a man in uniform. Is Coventry going to ignore Lord Kitchener's appeal for MEN?"

FROM THE SAME CONTEMPORARY, SEPTEMBER 15TH, 1914:

"There are very few single men left in Coventry, so great has been the response for men for Kitchener's Army."

"Coventry is now deserted, most of the well-known riders having enlisted, and the trade is working short hours on Colonial orders."

Motor Cyclists in the A.S.C.

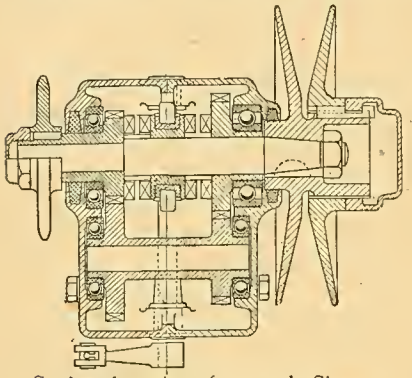
Many of our readers will be interested to know that S. A. Rowlandson, the well-known Rudge rider, together with C. T. Newsome and D. H. Noble, well-known as riders of the Rover machines, and W. L. T. Rhys (who once broke records on a Rudge) have joined the Army Service Corps (Transport Section), in which they are driving motor lorries. G. Featherstonhaugh has been at the front some time, and J. H. Ponntney has volunteered.

Numerous scouts, despatch riders, and other military motor cyclists patrol the roads on the North East Coast The photograph shows a group of men attached to the East Yorks. Regiment at their headquarters (Louth). There are thirty men with the regiment. The same number are attached to the Hants. Cyclists, and this regiment has all motor transport, the roads in the district being especially good.

A TWO-STROKE SINGER.

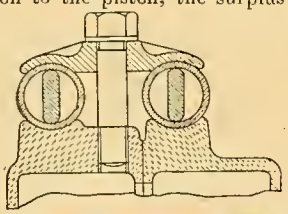
Engine Capacity, 349 c.c.; Drip Lubrication; Two-speed Counter-shaft Gear.

THE Singer Co., Ltd., of Coventry, have always been to the fore with a medium powered lightweight, and, after their many successes with the four-stroke type, it is not surprising to find them coming into line with a very neat and fully equipped two-stroke. The company are believers in the machine of moderate power as opposed to the "toy" engine, so that we find a single-cylinder engine of 75 × 79 mm. bore and stroke, giving a capacity of 349 c.c. The engine is peculiar in several ways, and though built under Peco patents is quite distinct in general appearance. The engine is of the three port type, having the transfer pipe cast with the cylinder and very high crank case compression. Roller bearings are employed on the crankshaft and big end, assisted in the former case by plain



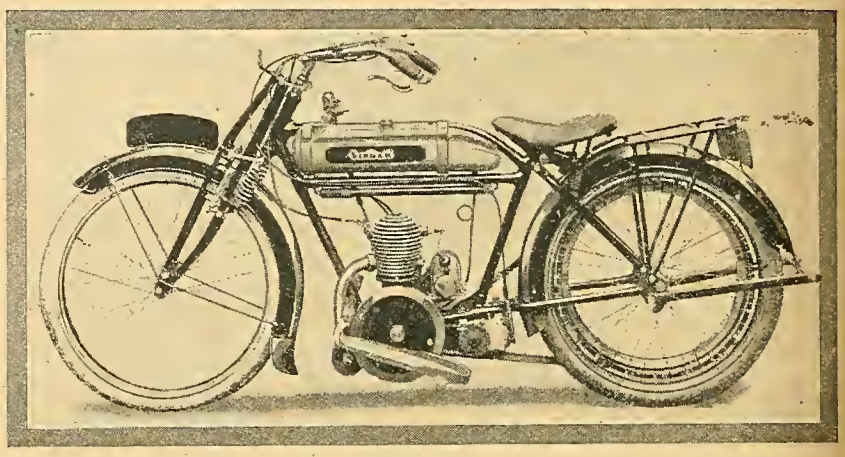
Section of gear box of two-stroke Singer, showing dog clutch mechanism.

compression retaining bearings. The piston has two top rings and is constructed with a double top which, besides raising the crank case compression, prevents the usual deposit of carbon below the head. Lubricating oil is fed through a sight feed drip to a ring round the cylinder formed by two cast iron ribs formed close together and closed by a surrounding wire. Thence the oil is led direct on to the piston, the surplus pass-



Method of attachment of gear box and liners within the frame tubes.

ing to a groove in the top of the crank case and thence through ducts to the main bearings. By this means the piston gets the full lubricating effect of the fresh oil—an important feature in a two-stroke engine where high piston temperatures are prevalent. The outside flywheel is of large diameter and all the weight is in the rim. The new two-stroke Singer is a fast machine on the road—43 m.p.h., we are told, is its maximum pace. This will not be wondered at when we state



Flywheel side of the new two-stroke Singer.

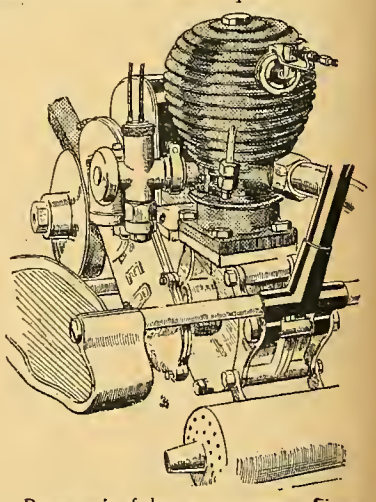
that during the exhaustive tests of the engine by the Singer Company the revolutions attained were 3,900 per minute.

An enclosed roller chain transmits the power to a two-speed gear, the change being effected by dog clutches, and both shafts run on ball bearings.

The actuation of the dogs is carried out by a lever on the handle-bar connected to the gear striking lever by Bowden wire. The handle-bar lever is fitted with a ratchet after the manner of Singer controls, and this scheme, besides being self-locking, does away with the necessity of an adjustment, for the slack of the wire is automatically taken up by moving the lever a notch further. An adjustable pulley of 6in outside diameter is a refinement which tourists will greatly appreciate. The normal ratios with the belt at the top of the pulley are 4⅓ to 1 and 8¼ to 1.

The Detail Work.

As might be expected, the cycle work and fittings are of the first order. Druid type forks, stout stand and carrier, 26×2in. tyres, Rotherham filler cap petrol gauge, and fully valanced mudguards are supplied, while special mention must be made of the fact that, unlike most manufacturers of light machines, the Singer Co. fit a large and comfortable saddle—to wit, the Brooks B 180. The U.H. magneto, which is placed high up behind the engine, is controlled from the handle-bar by a lever fixed directly above the gear lever, and an Amac carburetter supplies the mixture. The top tube of the frame is neatly dropped, and a cylindrical tank contains one and a quarter gallons of petrol and rather over a quart of oil.



Power unit of the new two-stroke Singer, showing method of lubrication and unusual shape of footboards.

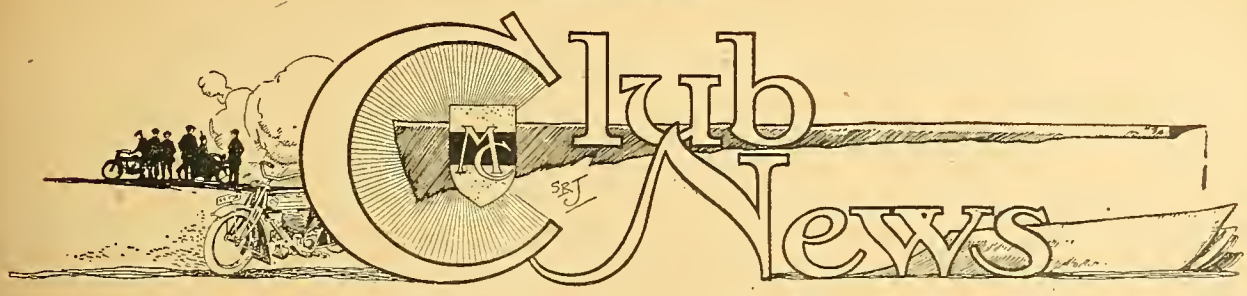
One other feature deserves special notice, and this is the fitting of aluminium foot plates, shaped to fit the foot, and having a curved up front to protect the toe. The top of this curved front is grooved, and forms an alternative position for the feet.

This very attractive little mount sells at £40, and should have a ready sale.

OUR ADVICE TO CLUBS.

At a time when every motor cyclist is anxious to serve his King and Country, and when all army vacancies are for the present filled, the advice of "THE MOTOR CYCLE" to Club Committees is to encourage members to cultivate assiduously an intimate knowledge of their own particular localities, to become well versed in the art of map reading, and practised in the handling of a rifle, so that, should their services be required they will be as useful as possible.

Ordinary competitions having been cancelled, Clubs might well arrange map reading contests and reconnaissance tests in districts not occupied by troops.



South Birmingham M.C.C.

After due consideration it has been decided to hold an informal competition on the 19th inst., starting from headquarters at 2.30 p.m. The route will be about sixty miles, and will include Beacon Hill, Rubery, and Abberley Hill.

Purley and District M.C.C.

A "treasure" hunt was held recently, clues being given in the form of a set of small photographs, with the aid of which the competitors had to find their way over a circuitous course. Results: 1, R. H. Billinghurst (3½ Rover); 2, J. Bemsham (6 Enfield sc.); 3, A. H. Wright (6 A.J.S. sc.); whilst other competitors won bronze medals. Despite the number of keen members who have been called to the colours, there was a very fair attendance, and twenty sat down to tea at Leatherhead.

Cork and District M.C.C.

A hill-climb took place on the 9th inst. R. B. Baker, who did the best performance in the flexibility test, is the holder of the Pike Challenge Cup. The formula used was: $\frac{\text{Slow time} \times W.}{\text{Fast time} \times C.}$ In Classes A, B, and C *The Motor Cycle* formula was employed. Results:

CLASS A. Machines up to 350 c.c. On Formula.—1, R. B. Baker (2¾ Douglas) 2, S. H. Driug (2¾ Douglas). Fastest time, R. B. Baker, 43⅘s.

CLASS B. Machines 351-600 c.c. On Formula.—1, C. S. Hosford (3½ Rover); 2, Jack Healy (3 Enfield); 3, J. Atkinson (3½ Rudge). Fastest time, J. Atkinson, 41⅘s.

CLASS E. Sidecar Machines 600-1,000 c.c. On Formula.—1, R. S. Russell (7 Matchless); 2, L. Dobbin (7 Matchless). Fastest time, R. S. Russell, 47⅕s.

FLEXIBILITY TEST.—1, R. B. Baker (2¾ Douglas); 2, R. S. Russell (7 Matchless sc.); 3, S. H. Driug (2¾ Douglas).

After careful consideration the committee has decided to run a few events.

Wolverhampton M.C.C.

On the 5th inst. the Wolverhampton M.C.C. held a paperchase over a sporting course. The team prize was not awarded owing to the small number of entries. Miss Lily Stevens made a most meritorious performance. Results: 1, W. Rudge (3½ h.p. Wolf), time error 2m.; 2, S. H. Shrubball (2¾ h.p. A.J.S.); 3, W. Stevens (2¾ h.p. A.J.S.) Silver medals were also won by the following: Miss Lily Stevens (6 h.p. A.J.S. sc.), J. E. Greenwood (6 h.p. Sunbeam sc.), A. H. Mould (6 h.p. A.J.S. sc.), H. Stevens (6 h.p. A.J.S. sc.), W. H. Egginton (6 h.p. Enfield sc.), and V. Edwards (3½ h.p. James sc.)

The twenty-four hour reliability trial for the Corke Cup will start at midnight on the 19th inst. from Ireland's Garage. Route: Wolverhampton, Worcester, Cheltenham, Bristol, Langford, and Weston-super-Mare. The return journey will include Cheddar Gorge.

Dublin and District M.C.C.

The Walker Cup, competed for in the reliability trial on the 5th inst., and reported in our last issue, was won by A. W. Mooney (6 h.p. Bradbury sc.) He and G. Roche (3½ h.p. Rover) secured equal marks in respect of reliability and restarting, and the result was determined by the difference between their times in the flexibility test. Roche was awarded a gold medal, and silver medals were awarded to the following, who secured over 95% marks, viz., J. Doleman (3½ h.p Rover), P. H. Hurst (3½ h.p. Rover), W. A. Campbell (3½ h.p. Rudge), J. Browne (3½ h.p. Rover), T. Toole (3½ h.p. Rover), and P. J. Fox (3½ h.p. Rudge).

The reliability trial which was to have been held on Saturday last was abandoned, but the concluding race meeting of the year at Portmarnock will take place on Saturday next.

Bridgwater Motor Cycle Corps.

On the 6th inst. a test was held by the recently formed motor cycle corps. Instructions were given to forty members to proceed by various routes singly, and at different times, to Cheddar, each man having to check at different places *en route*. Thirty-two members checked in on time, and only one man had trouble, and was unable to reach the rendezvous.

Meetings are being held each Monday and Friday at the local rink, where the men are instructed in drilling, rifle drill, signalling, and first-aid, and upwards of fifty men are rapidly becoming efficient. The corps has already supplied quite a number of men for Lord Kitchener's Army, and the Somerset Yeomanry and Territorials.

FLAGS ON TRANSFERS.

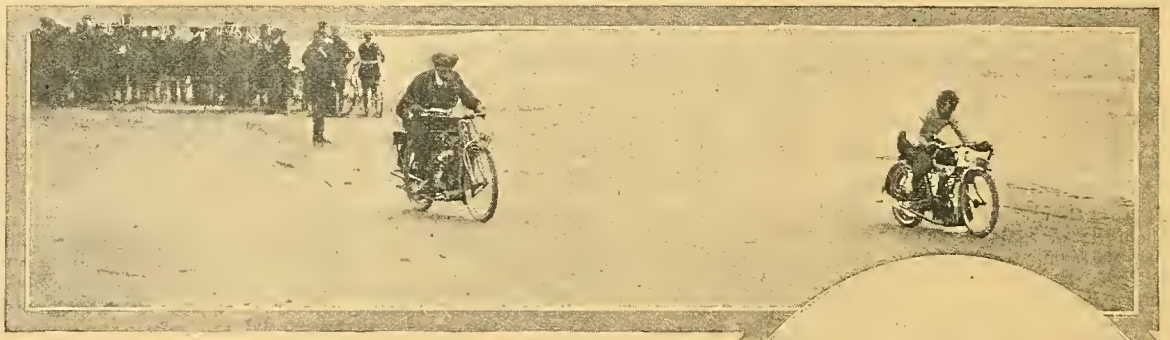
IT is an uncommon sight nowadays to see a motor vehicle of any sort minus a flag, so extensively has the national emblem been adopted by motorists in their spirit of patriotism. It must be confessed, however, that flags are not an entire success on fast-moving vehicles, as the fluttering to which they are subjected in the wind soon results in their edges becoming jagged and frayed. Quite a neat alternative has just been introduced in the form of a transfer produced in true colours, which is especially suitable for affixing to sidecars (particularly the coachbuilt variety), cars, and motor cycles. These transfers are particularly neat

A transfer flag in true colours on a sidecar

in appearance, not easily damaged, are absolutely out of the way, and are nevertheless attractive to the eye. Transfers of the national flags of all the Allies, measuring 3½in. × 2¾in., are now obtainable from our publishers, Iliffe and Sons, Ltd., 20, Tudor Street, E.C., at 7d. each post free. We illustrate a Union Jack as affixed to the front of a coachbuilt sidecar.

Speed Trials on Mablethorpe Sands.

THE Lincolnshire M.C.C. held a series of speed trials on the sands at Mablethorpe on Saturday last under most unfavourable conditions. There was a strong wind, and the driving rain rendered the sands wet and soft, thus causing a couple of spills. Really fast work was rendered quite impossible, but some interesting racing took place. Boards were placed on the sands to facilitate starting. Class I. proved a triumph for Mrs. Jennison, who managed her Douglas admirably. H. Petty (Norton) repeated his successes of the Coventry hill-climb and was first in no less than three classes. J. Veasey (Levis) and S. B. Briggs (Campion) were each twice successful. The heats were run off in pairs. Results are given below:



CLASS 1 (up to 350 c.c.)
Mrs. Jennison (Douglas)
J. Beckett (Diamond)

CLASS 2 (up to 600 c.c.)
H. Petty (Norton)
Second disqualified for not crossing line.

CLASS 3 (up to 770 c.c.)
H. Petty (Norton)
C. B. Sanderson (Ariel)

CLASS 4 (up to 1,000 c.c.)
S. B. Briggs (Campion)
G. Williamson (Indian)

CLASS 5 (two-strokes up to 350 c.c.)
J. Veasey (Levis)
W. Copley (Regal Peco)

(The above classes were for touring motor cycles.)

CLASS 6 (sidecars up to 600 c.c.)
W. Herring (Zenith)
— Jennison (Bradbury)

CLASS 7 (sidecars up to 1,000 c.c.)
B. Rhodes (Zenith)
E. Kemp (Campion)

CLASS 8 (T.T.'s up to 350 c.c.)
J. Veasey (Levis)
Mrs. Jennison (Douglas)

CLASS 9 (T.T.'s up to 600 c.c.)
H. Petty (Norton)
J. B. Drakes (B.S.A.)

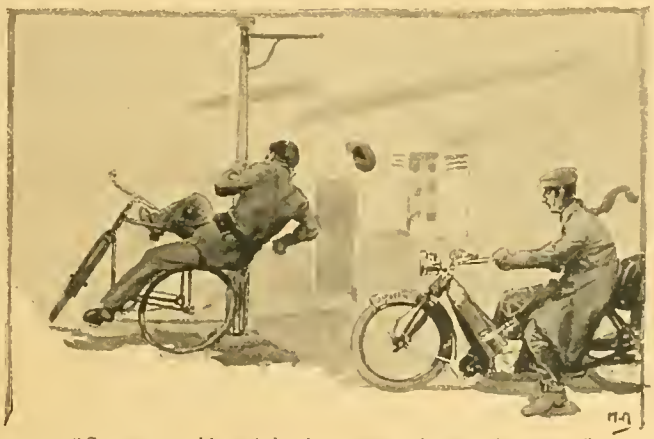
CLASS 10 (T.T.'s up to 1,000 c.c.)
S. B. Briggs (Campion)
B. Rhodes (Zenith)

(1) J. Veasey (Levis) getting away well. (2) A fine race between S. Briggs (8 h.p. Campion) and G. Williamson (7 h.p. Indian). (3) Start of a sidecar event. Boards were provided to assist starting.

A DASH FOR LIBERTY.

Thrilling Adventures of a Scott Rider in Germany and Belgium.

I WAS living at Karlsruhe, in the Grand Duchy of Baden, when the official mobilisation order was issued. War with France was inevitable, and as there seemed a great probability that England would join in before long, Germany could not be called a pleasant country to stay in. Trains were still running, but no one would guarantee that I would be taken to my destination, which was to be Brussels in the first instance, then London. A dash for liberty on my Scott motor cycle struck me as being much better sport than to be stranded in some German town, and I quickly decided to have a try. By means of a host of letters of recommendation, and after various difficulties, a military passport was procured. This allowed me to cross the German frontier "with my machine." The latter phrase was included after the paper had been filled in, and when I made the request I had no idea that on it would depend the safety of my mount. The next thing was to find some fuel. All the petrol had been requisitioned by the German Government. Through a friendly chauffeur I "found" four gallons. Two went into the tank and two one-gallon tins were strapped each side of the carrier in place of the tool bags. The latter, with a spare suit, some linen, and a few things I did not wish to leave behind, were stored in a portmanteau, and this was fastened across the carrier. A tin of oil in place of the end number plate brought up the rear.



"So great was his zeal that he at once rode into a lamp post."

All night from the 2nd to the 3rd of August the bicycle was overhauled and packed, with the assistance of the landlady's daughter, whose job it was to flash an electric pocket lamp wherever light was needed.

Adventures Soon Commence.

At 5.30 a.m. on Monday, the 3rd, I set out for Brussels. The road circumstances would choose, but it was certain that it lay towards Cologne and not through Luxemburg, as sharp fighting had taken place in Alsace, and the wounded had already been brought to Colmar. Friends who knew of my intentions prophesied many things—they were mostly not exactly cheerful. Everyone was certain that I would never reach Brussels, and most people agreed that I would be shot before crossing the Rhine. The common advice from everybody was "Don't go." After riding for ten miles I was stopped for the first time, my papers were verified, and my luggage searched. The stopping is done in a most effective way. The street is barricaded and two members of the civic guard or soldiers point a loaded rifle with fixed bayonet at you. One man covers you while you pass your little exam. If the guards decide that you are O.K. you are told that you may ride on but will be shot unless you dismount at first call. These stoppages occurred about every ten miles. Most of them went off as described. The men were business-like and strict, but not impolite. A few instances, however, deserve special mention.

While riding along in Mannheim in search of the Belgian Consul, and thinking of nothing except my machine, which was ticking over most beautifully, I suddenly heard violent shouts. It turned out to be a man who was pursuing me on a push bicycle. He rode up with great dash and informed me, "*Sie sind ein Franzose*" (You are a Frenchman), and that I was under arrest. All argument was useless, so I asked him to show the way to the Belgian Consul. By this time we had a crowd around us, and it had been decided that I was a French spy. Still there was no danger in taking even a spy to the Belgian Consul, and the gallant captor proudly led the way. So great was his zeal that he at once rode into a lamp post, and on turning my machine I found the poor man picking himself up. Anxious not to provoke the slightest suspicion of wishing to escape or to go wrong I asked if that was my road. He looked furious, mumbling something about every German doing his duty for the Fatherland.

A Search for the Consul.

We had quite a long ride together, as he first took me to the wrong end of the town and then almost back to the starting point. In the course of our travels, I apologised to my companion for the trouble I was giving him, and hoped that I was not monopolising too much of his valuable time. The answer was a very neat little speech in which I learnt that every son of the Fatherland cannot spend his time better than in sacrificing it to stop the disgraceful practice of spying which is resorted to by other nations and which alone endangers the position that great empire holds in the sun. Furious glances also came my way. Not being vain enough to think that they might be meant for me, I asked my escort how he liked my machine. As there was no answer, I proceeded to explain the advantages of a water-cooled, two-stroke, valveless, chain-driven, double-geared English motor cycle, and it only occurred to me much later that the man was watching me as perhaps he feared I might run away. Such thoughts I am prepared to forgive him. He was surely no motor cyclist, and, therefore, could not understand the far greater merits of a machine creeping silently along the streets through the traffic, at almost a walking pace, compared to the possibility of my bolting on the throttle suddenly being ripped open; besides, he was doing me a great favour by showing me the way.

A Dash for Liberty.—

Finally, we did reach the Belgian Consul, whom I knew very well. He sent off the man and informed me that the Belgian frontier was still open; whether it would be when I reached it he could not say. My patriotic escort looked calmed and a little sheepish. This did not prevent us parting on quite good terms. After obtaining some advice about the roads, I thanked him for his services and expressed a hope that the same courtesy would be shown to all foreigners.

The disagreeable thing about these stoppages was the loss of time. To reach the Belgian frontier that night 350 miles had to be covered. This had made me decide that the speed limit should be governed by the state of the roads and nothing else. As there were 80 lb. of luggage on the carrier, besides fuel and oil, I could not do much more than 45 m.p.h. whenever the road was at all uneven, for fear of something coming unstrung.

Arrested as a Russian Spy.

The next unpleasant experience was at Seeheim, on the famous Bergstrasse, which runs along the hills from Heidelberg to Frankfurt. There two worthy old men were guarding the barricade. The first one wanted to shoot me because on stopping I stayed astride my machine. How was I to steady it otherwise and have my hands free for showing my papers? Number 2 did not think his companion-in-arms had a right to pot me there and then, or perhaps he feared being robbed of his share of honour and glory. A heated discussion started. I awaited my turn sitting on the bicycle eating chocolate, as there was nothing else to do.

"In a small village I was stopped by a Landsturm man."

To Shoot or not to Shoot.

Gradually things went worse. No. 1 was determined to have his way on the "I saw him first" principle, and let daylight through me at once. Luckily, No. 3 turned up and, joining No. 2, overruled his bloodthirsty countryman. A crowd of so-called patriots always linger at these "hold-up depots." They had all more or less joined in the argument, but Nos. 1, 2, and 3 shouted loudest. When anyone comes along on car or bicycle, people spring up by the dozen to see the fun. This time I was a Russian spy. My papers were false, the petrol and oil tins contained explosives, and the club mascot was a bomb to be exploded by the wire holding it.

These facts had one good effect, they forced the crowd back. I was first ordered to remove the bombs. This was not done without fear, as the brave guards were trembling for all they were worth, and I was not at all sure that one of the shakes would not pull a trigger of the rifles, which were, of course, pointed at me. The electric connections with the bicycle, which were to let loose these "infernal machines" having been cut, the liquid running from tins and the sawdust from the mascot soon proved what I had not dared to argue. But this was no proof of my innocence. I was next made to half undress on the road, then marched back and guarded until a *gendarme* could be fetched. This took two hours. Fortunately it was warm, or my half-naked condition might have been less pleasant than it was. On the arrival of the *gendarme*, the usual examination was gone through and I was set free. The humour of the crowd at once swung round, and, when the kick-starter set the engine going, it was amid the cheers of the people who only a quarter of an hour ago had sworn to lynch me. It may be unpleasant awaiting your turn in a room with a howling village mob outside, but I was to learn that things may be a lot worse without being fatal.

Obstructions Worse than Freak Hills.

Darmstadt was reached at about three, and my hopes of reaching Aachen before dark rose. As I was nearing the fortified regions on the Rhine, things did not go as smoothly as they might have done. In spite of more or less serious checks, it was not too late at Mainz to get, at any rate, to Cologne before night fell. I crossed the Rhine bridge with less difficulty than I had expected and found myself on the road to Lingen in high spirits, regretting only that I had no leisure to admire the lovely Rhine Valley I was travelling through. But before many miles had been covered a most unpleasant thing happened.

A Case of Dutch Courage.

In a small village I was stopped by a Landsturm man (member of the civic guard), who had evidently not been satisfied until he had seen the bottom of several bottles, and who was smelling more of drink than of powder. His condition made it absolutely impossible for him even to recognise my military passport, and before a few minutes were over a furious crowd had gathered, whose leading members were much in the same state as the man I had to thank for my none too envious situation. The fact that this man had a loaded rifle made things look decidedly black. A *gendarme* happily turned up, saw the danger, rushed me into a building, and took the matter into his hands. He thought my papers, or me, rather lukewarm, and decided to get someone who knew French and English to examine the contents of my pocket book and letter case. My luggage was searched as it had never been searched before, but, as all things were known to him, except, perhaps, the toothbrush, there was nothing to be said. W.S.

(To be concluded next week.)

NEW MAGNETOS.

An All-British Machine, and a Small Instrument for Two-stroke Lightweights.

THE C.A.V.

MESSRS. C. A. Vandervell and Co., Warple Way, Acton Vale, W.—a firm which has studied the electrical side of motor cycle engineering ever since the inception of the industry—have for some years past interested themselves in an excellent magneto which, like others in this country, hailed from the land of the King's enemies. Now, however, they are engaged in turning out large quantities of British-made C.A.V. magnetos at their splendidly equipped electrical works, which are an improved copy of those which up to the present have been made abroad. Firms such as Rudge-Whitworth and B.S.A., which already have contracts with Messrs. C. A. Vandervell and Co., will very shortly receive consignments of magnetos made at the Acton works.

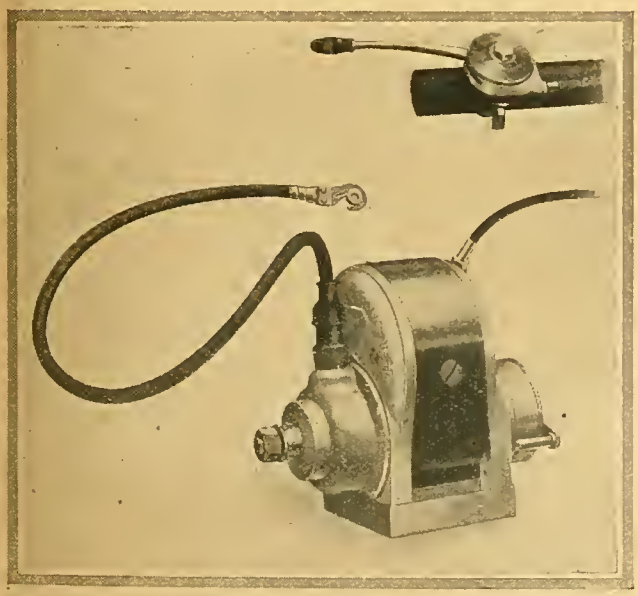
Easy Starting Attained.

The C.A.V. magneto possesses several distinctive features. It is made with the greatest accuracy to limit gauge, it is light in weight, and will start the engine more easily than those magnetos in which the magnets are placed side by side, as, in the C.A.V. the field magnet system is over the soft iron portion of the armature, and consequently less lag and greater liveliness are claimed. There are also no spaces through which water can enter, and it is claimed that the C.A.V. will work perfectly when completely immersed in water. Yet another point worthy of comment is the making of the carbon brush holder and terminal in one, a very fine piece of work which makes a secure electrical connection and is quite waterproof. Before being screwed with the threaded portion in the interior of the terminal, the high tension wire is bared, unravelled for about half an inch, and the ends turned back over the insulation. The contact breaker can never give trouble through a sticking rocking arm, as such a thing does not exist, since the movable platinum point is mounted on a spring which is forced outwards when the large and loose fitting fibre roller comes between the cam on the inside of the contact breaker case and the block holding the stationary platinum point.

The C.A.V. magneto, with contact breaker mechanism exposed.

No Lubrication Required.

With these magnetos no lubrication is needed, and the ball bearings are greased before the machine leaves the makers and no further attention is needed. The company have records of magnetos which have run for four and five years without any necessity for further lubrication. When the advance and retard are controlled by Bowden mechanism, the outer cover of the contact breaker is provided with two pins, of which one limits the range of movement while the other abuts against a ball, behind which is a powerful spring half buried in a groove in the end plate. This spring is entirely covered by the contact breaker cover, and, thanks to the former's protected position, the latter can never stick or jam even in the wettest weather. At the time of our last visit to the Acton works we saw the first batch of British-made C.A.V. magnetos undergoing their tests. These will be made in all forms to suit every type of motor cycle engine.

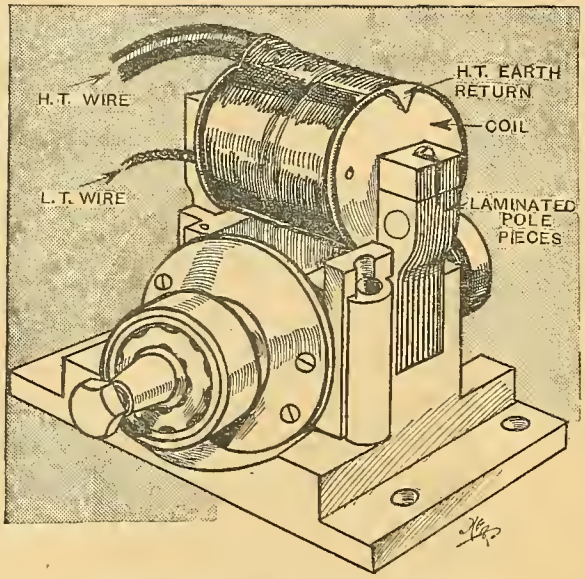


C.A.V. Bowden controlled magneto, showing high tension terminal and brush holder.

THE DIXIE.

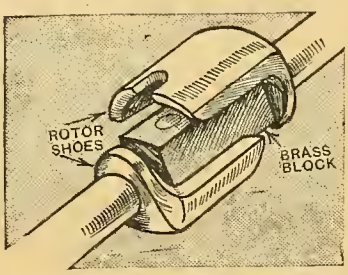
The Splitdorf Electrical Company, 6, City Road, E.C., has lately placed on the market a magneto specially designed for lightweight two-stroke engines. In this type of engine the high number of revolutions attained causes a heavy strain upon the armature winding of the magneto. To get over this difficulty the new Splitdorf magneto departs considerably from standard practice. In the first place, there is no armature proper, but a rotor with staggered shoes, while the magnets are placed in line with the rotor spindle instead of at right angles to it as in the ordinary

New Magnetos.—



Dixie magneto with magnets and end plates removed.

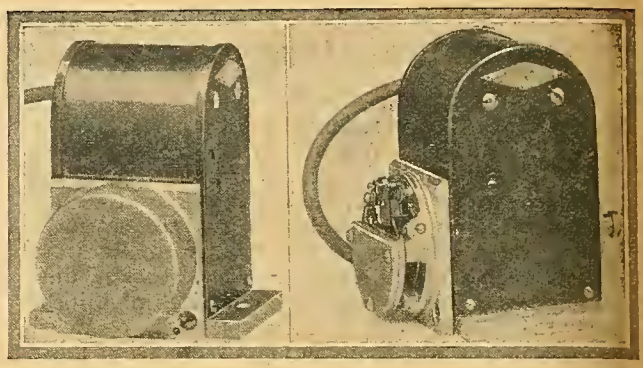
magneto. The pole pieces proper are of laminated steel, and above them is carried the coil which takes the place of the ordinary armature winding in a standard magneto. It is placed on the top of the laminated pole pieces, attached by means of two screws, and can be easily removed. It is interesting to note that the ends of the coil are of insulating material, and there is no tendency whatever in this carefully thought-out magneto for the high-tension current to jump to the side.



Novel rotor of the Dixie magneto.

The Novel Rotor.

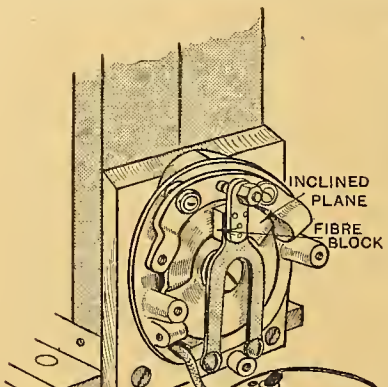
The rotor shoes are mounted on a block of non-magnetic material, which serves to hold the entire rotor structure together. The rotor shoes run in close proximity to the flanges, against which the magnets abut when in position (these latter being held by the waterproof casing, no screws being employed), one magnet being on either side of the spindle, consequently the rotor shoes are of opposite polarity, and there is no change in the direction of the magnetic flux through the rotors, the only reversal of the magnetic lines taking place through the laminated pole pieces and the core of the coil. This causes a short free path for the reversal of the magnetic lines, and hence the hystereses and eddy currents are reduced to a minimum. A high tension lead is brought out through the cover by means of an insulating wire connected to the sparking plug terminal, and thus does away with the necessity of a carbon brush and collector ring.



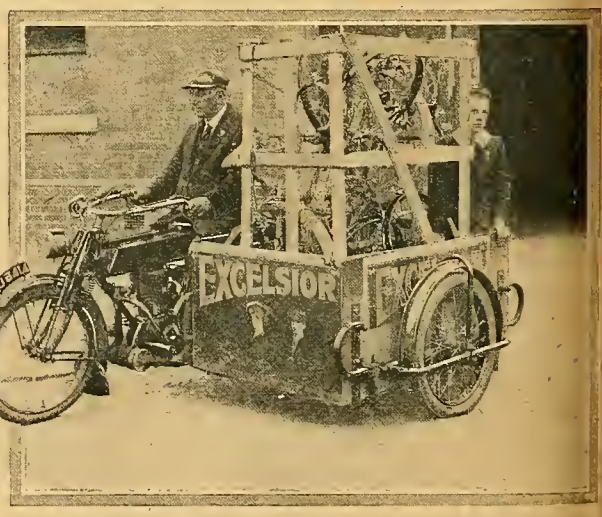
Two views of the complete Dixie magneto.

The Contact Breaker.

The contact breaker is of peculiar pattern, and its differences from standard practice will be seen from the accompanying sketch, while the condenser is carried on the end plate carrying the contact breaker mechanism. One of the obvious advantages is that while in the standard magneto the very high armature speed causes a tendency for the winding to unwind itself owing to centrifugal force, such a state of affairs cannot possibly obtain in the magneto described. The magneto fires at extremely slow speeds, even with the spark under high compression.

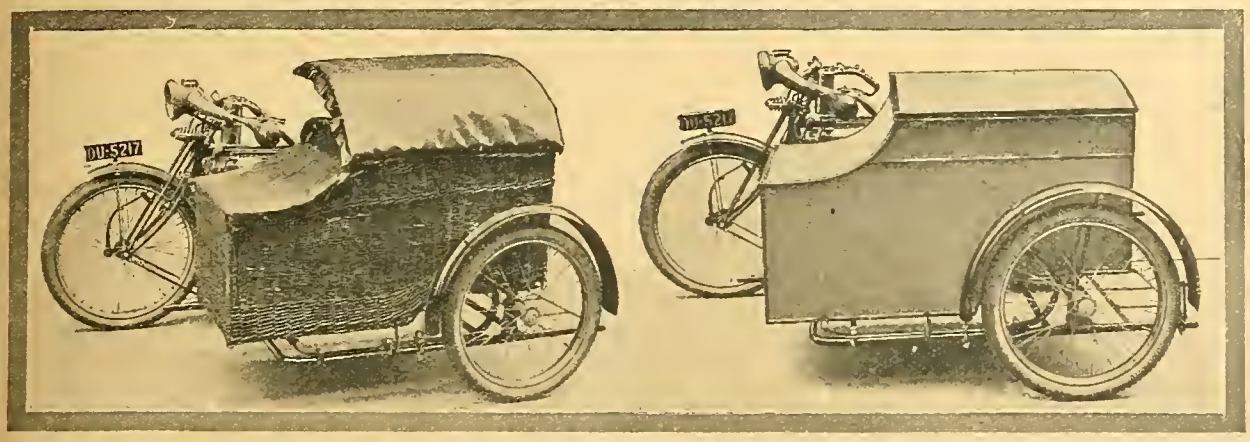


Showing condenser removed.

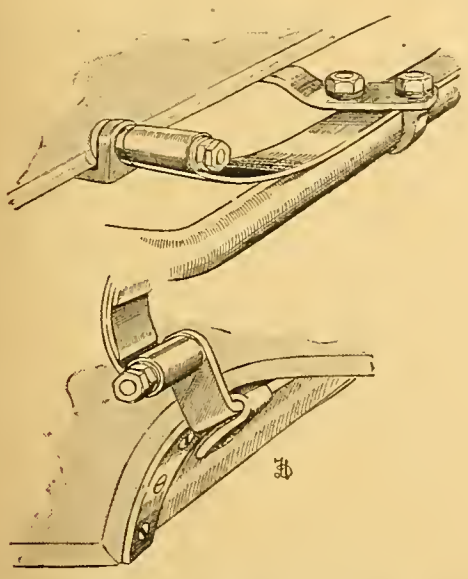


The Excelsior sidecarrier in use in the cycle and motor trade.

THE GLORIA SIDECARRIER.



The Gloria wicker and coach-built sidecarriers.



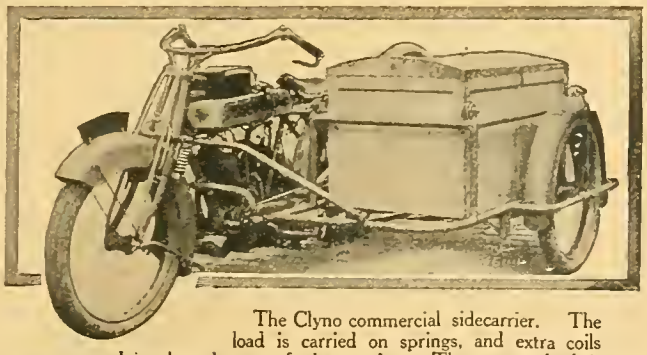
The easy and accessible attachments of the Gloria sidecarrier body. The standard No. 1 or 1a chassis is used.

ONE of the most interesting features of the new Gloria commercial carriers is the fact that the body can be fitted to the standard No. 1 or 1a chassis quickly and without alteration. The touring body is removed and the bar connecting the rear springs left in place, and the attachment of the box carrier is effected in a most simple and convenient manner, with no inaccessible nuts to get at.

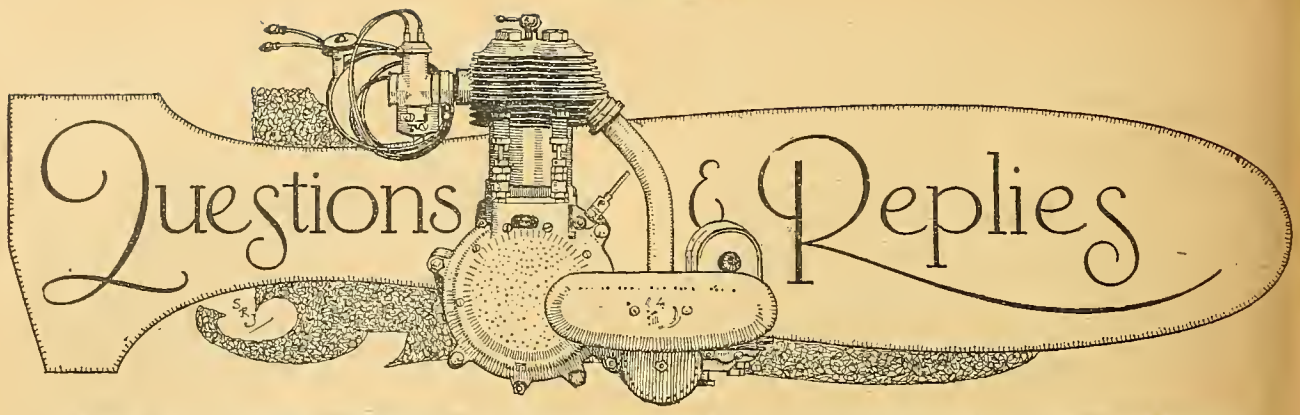
The under part of the box towards the rear of the machine is fitted with two long and substantial hooks, which slip over the above-mentioned bar connecting the rear springs, while the front rests on a similar bar joining the front springs. In addition to this, a spring bar is fixed to the bottom of the box close behind the front cross bar. This is clipped to the frame by a U clip on each side, all the nuts being outside the body and consequently easy to reach. It will be obvious that this third crossbar forms an auxiliary spring as well as a fixing, so that it is of little consequence if a heavy load is placed well forward. The body, which may be either of wicker or coachbuilt, is cut away at the forward end so as to allow the handle-bars full motion and increase the available steering lock. In all details both body and chassis are really well carried out, and the carrier has been thoroughly tested under heavy loads.

THE CLYNO COMMERCIAL SIDECAR.

FOR some time the Clyno Engineering Co., Ltd., have been supplying the New Zealand postal authorities with special sidecars. We are illustrating a vehicle which has been designed by this firm for all sorts of commercial purposes, and can be fitted up to any specification that might be put forward by a tradesman. The frame is built up sturdily with very few curves in it and is square in form. The body is suspended on two leaf springs underneath, whilst at each corner small springs are located to absorb any further shocks. There are, of course, many advantages in using such a combination, as a spare wheel can be carried which can be interchangeable throughout. This particular type of sidecar has been thoroughly tested, as the firm was building these some two years ago.



The Clyno commercial sidecarrier. The load is carried on springs, and extra coils support and insulate the top of the carrier. The spare wheel is carried beside the box.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Gear for Sidecar Work.

I have a 1912 single-cylinder motor cycle fitted with a N.S.U. gear with variable pulley. The lowest gear I can get on top is 4½ to 1 with 1in. belt. Is this gear too high to run a sidecar?—C.P.

The gear should be about right for sidecar work if the engine is a fairly powerful one. You do not mention this in your letter, and, of course, it is the most important point. If the engine develop a reasonable amount of power you could take a sidecar over most places, but not up many single figure gradients.

Learning to Fly.

Although it is not exactly connected with motor cycling, I should be glad if you could inform me where I could take a course of lessons in the management and working of aeroplanes, and how much such a course of instruction would cost?—W.C. (Monaghan).

There are numerous aviation schools in England, but we are not sure whether there are any in Ireland. Probably you would obtain information on this score if you wrote to the Editor of *The Motor News*, 34, Lower Abbey Street, Dublin. In England, there are large schools at Brooklands, Surrey, and Hendon, N.W. If you wrote to the secretary of either of these, you would obtain full information such as you require.

The Midlands to the West.

Will you be good enough to plan me a route from Leicester to Torquay? I propose to take two days over the journey, staying at a point about halfway for the night. Perhaps you could recommend a good stopping place. I am riding solo, so that hills will not worry me.—E.B.B.

This is a pleasant trip, and we advise you to go from Leicester *viâ* Lutterworth, along Watling Street to Daventry, then through Banbury, Chipping Norton, Burford, Cirencester, Chippenham, Melksham, Trowbridge, Frome, Bruton, Sparkford, Ilchester, Ilminster, Honiton, Exeter, Chudleigh, Kingsteignton, Torquay. Cirencester would be a convenient place to stay the night, and there are one or two very good hotels in that town.

More Speed Required.

Can you assist me in regard to my 3½ h.p. 1913 motor cycle and sidecar? With the running I really have nothing to complain of up to 25 m.p.h.; it starts easily, runs smoothly and quietly, but if I should exceed this speed the engine races tremendously. The sidecar may be somewhat heavy, but in the first quarter of the year I could get up to 30 m.p.h., after which the above trouble made itself felt. I have recently fitted a new carburetter and belt, had the pulley re-turned, and, further, the back wheel with three-speed gear has been overhauled by the makers. I do not think, therefore, the trouble is due to belt or clutch slip. I have well cleaned the cylinder, piston, and rings, removed carbon, etc., adjusted valves, and all has been inspected by an expert motoring friend who pronounced all in good order. I do not wish to become a "speed merchant," but would like to feel that when travelling 20-25 m.p.h. I still have something in hand, and from what my friends tell me in regard to their outfits I ought to get it from mine. But they don't tell me how to do it!—R.W.

You should certainly be able to do more than 25 m.p.h. on your machine, and the slipping which you complain of must almost certainly either be due to the clutch or to the belt. There is just a chance, however, that the key of the pulley has been left out, and that if you take off the pulley and inspect this detail you might be able to stop the slipping. But we think that you will find the fault is due to clutch slip when under heavy load. Wash the clutch out with a little paraffin and then lubricate with thin oil and see that the plunger rod operating the clutch is quite free of the toggle when the clutch is home.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected matter will only be returned provided a stamped addressed envelope is enclosed for the purpose.

Abergavenny to Preston.

I should be obliged if you would give me the best route, together with the approximate mileage, from Abergavenny (Mon.) to Preston (Lancs), avoiding as far as possible the large towns. At the same time, can you recommend a good road map, and give a note of the cost?—H.R.H.

Your best route would be to go from Abergavenny to Hereford, and thence through Leominster, Ludlow, Craven Arms, Church Stretton, Shrewsbury, Whitchurch, Tarporley, Warrington, Wigan, and Preston. If you like, you can avoid the manufacturing district by following the road signposted by the Royal Automobile Club from Warrington through Rainhill, Prescot, Rainford, Ormskirk, and Rufford to Preston. This, however, is a little difficult to follow. The distance is approximately 157 miles. The best map for England and Wales we can recommend is *The Autocar* Sectional Road Map, price 4s. 10d. post free from Iliffe and Sons Ltd., 20, Tudor Street, E.C. Bartholomew's half-inch maps are also excellent.

Powerful Twin for Overseas Use.

Would you kindly favour an Overseas reader of your paper with your opinion on the following point? I have a 3½ h.p. single-cylinder machine of first-class make, which I use solo, but am thinking of getting a powerful twin-cylinder for sidecar use, and have a *penchant* for a M.A.G. engine. Do you consider these engines are first-class in every way; that is to say, fast, flexible, silent, and powerful? This make of engine is rather scarce out here at present.—E.W.S. (Melbourne, Australia).

The engines in question are magnificent; they are beautifully made and well finished throughout. We are of opinion that you will be entirely satisfied if you order one of these engines. They wear very well and are fast, and will stand a fairly high gear, and are remarkably silent. We are only too glad to help our readers, especially those who live so far away, from whom it is always a pleasure to hear.

¶ Hitherto we have refrained from recommending the use of Lodge plugs simply because they were British made.

¶ Our aim has always been and always will be to make the **best** plug in the world.

¶ We understand, however, there is at this present juncture a special desire on the part of motor cyclists to know which accessories are really British. Accordingly we have pleasure in stating that

LODGE PLUGS

are made in England, : by an English firm, : with English capital.

AS USED BY ALL H.M. GOVERNMENT DEPARTMENTS.

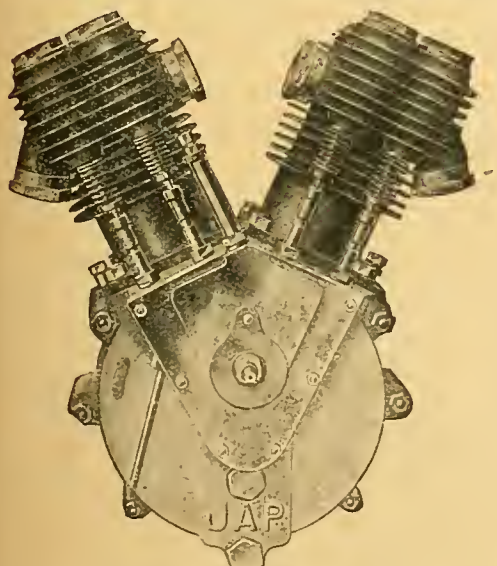
Standard model, as illustrated, **4/-** each, of all dealers,

or post free, by return when remittance accompanies order, direct from the manufacturers:—

THE LODGE SPARKING PLUG Co., Ltd., BIRMINGHAM.

THE — J.A.P. MOTORS — ALL BRITISH.

Juniors, Amateurs, Professionals,



are all unanimous in the sterling qualities of the J.A.P. MOTOR.

Irrefutable proof of the efficiency of J.A.P. Motors is to be found in every race or trial in the world The overwhelming success attained this year has more than justified their title of "The motor of motors," and they continue day by day increasing the great popularity gained at their inception

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. ooo, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

Acme.

ACME-ARIEL, 3½h.p., coachbuilt combination, complete, and equal new; cost £70, £50, no offers; great bargain.—Luckhurst, 32, Boulevard, Weston-super-Mare. [X9540

A.J.S.

A.J.S., late 1913, 2¾h.p., 2-speed, E.R.S. headlight, new spare cover and tube, condition perfect; £35.—Ogilvie, Guy's Hospital. [6955

1913 A.J.S., 6h.p., coach sidecar, perfect, just overhauled; owing to enlistment sacrifice, £56, cost £87.—Collins, Chemist, Pontefract. [X9589

A.J.S., 1912, 5h.p., with 2-seater Bowser sidecar, lamps, horn, speedometer, 3 spare tubes, etc., not run 1,500 miles since thoroughly overhauled by makers; £55.—Brooke, Temple Buildings, Swansea. [X9552

Antoine.

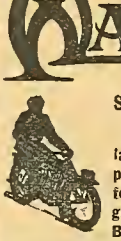
ANTOINE, 2¾h.p., Bosch, B.B., Druids, 26×2¼, low, overhauled, enamelled and plated; £14; any trial.—50, Thornhill Rd, Barnsbury, N. [X9475

Ariel.

ARIEL, 1913, 3½h.p., sidecar, complete accessories; £35.—Palmer, 76, Bedford Hill, Balham. [7021

ARIEL, latest 5-6h.p. model, 3-speed counter-shaft, brand new; exchanges invited.—Bunting, Harrow. [X9547

IF YOU GET IT AT HAUCHOPES



SATISFACTION IS SURE.

THE DRUID

—means easy and vibrationless riding, always.

"Vibration" has no terrors for the thousands of Motor Cyclists who ride "DRUID-equipped" machines — they never trouble about rough roads — for "The DRUID" smooths out their path and ensures easy and vibrationless riding.

— Are you troubled with vibration? — if so, get your machine fitted with "The DRUID," you'll then ride in perfect comfort — its "*Scientific Design*" and "*Perfect Spring Principle*" ensure this.

— "The DRUID" Spring Fork was fitted on the WINNING MACHINE (A.J.S.) in the 1914 JUNIOR T.T. Race.

— Ask us for particulars.

FORWARD MOTOR CO.,
Summer Row, Birmingham.

Why wear the "Red Seal" Motor Suit—

ONE REASON.

61, DALE ROAD, BUXTON, *May 18th, 1914.*

I ear Sirs,

The "Red Seal" Motor Cycle Suit which I bought some months ago has passed through a very severe test, and I am pleased to say that your guarantee can be safely relied upon. I was compelled to travel over forty miles in an incessant downpour of heavy rain, in order to fulfil an engagement as organist at a chapel one Sunday morning, and thanks to the storm-resisting qualities of the "Red Seal" I arrived at my destination quite dry and fulfilled my duties without the trouble of changing my clothing. Hoping other motor cyclists will recognise the splendid quality of goods you are making.

I remain, yours faithfully, ERNEST HARGREAVES.

Wholesale only from—

ROBERT H. PATTERSON (Manchester), LTD.
CANNON STREET, MANCHESTER,
who can supply all sizes by return in seven distinct styles.

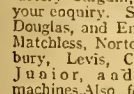
SCOTLAND'S BEST BARGAINS

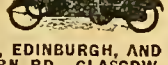
IN

MOTOR CYCLES AND SIDECARS FOR TRADE OR PLEASURE PURPOSES.



Also in 2 Stroke and Lightweight Motor Cycles, and reliable Light Cars.

If you want a really satisfactory bargain, New or Second-hand, send us your enquiry. Sole Scottish Agents for Indians, Douglas, and Enfields. Agents for Williamson, Matchless, Norton, P. & M., Bat, B.S.A., Bradbury, Levis, Calthorpe Junior, and Veloce machines. Also for Ford Calthorpe, and G.W.K. Light Cars.



123-125, LOTHIAN ROAD, EDINBURGH, AND 272-274, GREAT WESTERN RD., GLASGOW.

EXCHANGE.

ENFIELD Combination, 1914, gears, chains, for 3½h.p. 3-speed.—Riches, Wollaston, Stourbridge. [X9577

EXCHANGE Metallurgique Motor Car for new Douglas and cash.—246, High Rd., Balham. [7029

NEW Bramptoo Gear, fit Triumph; 70/-, or exchange free engine wheel.—61, Albert Rd., Luton, Beds. [7049

1911 V.S. Sidecar, 7h.p., 2-speed, for 1914 2-stroke, with gears.—Dunning, 7, Baronsmere Rd., East Finchley. [6998

2-SEATER Vulcan Car, value £35, for 3-speed combination, or A.C. sociable.—84, Brushfield St., Bishopsgate, E.C. [6963

EXCHANGE 1913 3-speed 5-6h.p. Clyno motor cycle for 1913-1914 3-speed Triumph and cash.—70, West Hill, Wandsworth [6958

DE DION Car, 4-seat., 10-12h.p., complete, for good motor cycle; sell £50.—Aoforth, Raikes Rd., Great Eccleston, Garstang. [X9282

EXCHANGE 5-6h.p. V.S. end sidecar for 3½h.p., 3-speed, handle or kick starter; sell £25.—Daniels, 32, Grenard, Peckham. [7008

1914 3½h.p., new Fofnir, Armstrong VII., latest fittings, for lightweight and cash; sell £35, lowest.—B.H.P., 2, Park Av., Hampstead. [7086

CLYDE 2-seat. Car, live axle, dual ignition; exchange for motor cycle, or sell £40.—Longman, 1, King St., Acton. Tel.: Chiswick 1578. [6880

4-CYL. F.N. (1909), in good condition, hot stuff, tyres good; sell £17; too fast; exchange lower power.—Page, 29, Artillery Rd., Guildford. [X9474

1913 Wilkinson T.M.C. Combination, cost £115, for lightweight or solo machine, or sell £50, offers.—Rev. Dowoman, Alvington, Lydney, Glos. [7108

SMART 2-seat. Light Car, exchange modern high-powered chain-drive combination, Indian preferred.—Woodside, Robin Hood Lane, Sutton, Surrey. [X9546

EXCHANGE 1912 4h.p. Rex, 2-speed, cane sidecar, 3 lamps, speedometer, accessories, spares, for good furniture; sell £34.—Collins, 18, Crawford St., London, W. [6960

SMART Little 2-cyl. 9h.p. Darracq 2-seat., hood, screen, lamp, Stepney; exchange sidecar combination, cash either way.—P. Riddelsdell, Boxford, Suffolk. [7044

2¾h.p. Minerva Motor Cycle, B. and B., Palmer tyres, exchange for push cycle and cash.—Letters only, E. Overington, Station Approach, Earlswood, Surrey. [7017

8h.p. Williamson, Canoelet de Luxe sidecar, 1914 improvements, kick starter, drip feed, new tyres, perfect condition, for Morgan or light car.—Duckham, Clytha Sq., Newport. [7054

HUMBER Cycle Car, 2-seat., water-cooled, low, painted French grey, 6-6h.p., for good 3½h.p. or 5h.p. motor cycle, twin preferred.—Herring, 49, Manor Rd., Stoke Newington, N. [X9612

HALIFAX.—Special exchange allowances against new 1914 Williamson and Rex-Jap models; also new 1913 Rexes at special bargain prices.—Motor Exchange, Westgate, Halifax. [0488

ADVERTISER, having recently purchased 1914 7h.p. 2-speed chain drive Excelsior, which he has not used, is desirous of exchanging same for 2-seater car.—Write, H. Seymour, 7, President St., E.C. [7122

EXCHANGE 8h.p. Bat-Jap, 2-speed, kick starter, and sidecar, fully equipped, many spares, excellent condition, very powerful, any trial, for lightweight and cash, or sell £42.—Offers to A. Sealey, 88, Princes Av., Watford. [6992

REGAL, T.T., 1914, 3½h.p. twin Moser engine, Armstrong 3-speed, purchased August, done 400; exchange higher power, Indian T.T. preferred; sell £41.—Stevenson, Francis Villa, Woodfield Av., Wolverhampton. [7056

REPAIRERS.

ANTOINE Cylinders, pistons, and parts; prompt delivery.

CYLINDERS, crank cases welded; quotations free.

COMPRESSION Cylinders ground and new pistoo fitted, 24/-.

OLDEST Engines restored to highest vitality.

COMPLETE Overhauls at lowest possible prices. Full stock of Rex, Triumph, and J.A.P. parts.

COUNTER-SHAFT Gears.—We can now quote the trade for our Rex-J.A.P. 3-speed gear at inclusive prices, including fitting to old machines.—The Premier Motor Co., Ltd., Astoo Rd., Birmingham. [0246

VALVES.—Nickel steel valves, any size, 3/6; per pair 6/-.—C. R. Foster, Kirkstall Rd., Leeds. [0253

WELDINGS, Ltd., Dept. M.C., 235, Gt. Ancoats St., Manchester.—Oxy-acetylene welding experts.

BROKEN Flanges, valve seats, pistons, crank cases, water jackets, welded and machined complete.

SEND Your Old Engine or complete machine for overhauling, re-bushing, cylinders re-ground, new pistons, rings, and gudgeon pins fitted.—Weldings, Ltd., Dept. M.C., Manchester. [6234

THE LATEST NOVELTY IN FLAG MASCOTS.

No. 108b—2/-, Complete as illustrated. with three Flags. Postage 1d. No. 108c—2/7, Any combination of Nationalities may be had Size of Flags 4" × 2".

No. 108a. Large Motor Cycle Size, 6/9 complete, Postage, 2d

All with Polished Aluminium Number Plate Clip.

FLAG MASCOTS A SPECIALITY.

Motor Cycle Flags mounted on Nickel-plated Pins, with solid brass ornaments.

Sizes—6" × 4" .. **10d.** each. Ordinary Pin.
" 6" × 4" .. **1/1** " Stout Pin.
" 6" × 3" .. **9d.** " Ordinary Pin.
" 6" × 3" .. **1/-** " Stout Pin.
" 4" × 2" .. **7d.** " Postage 1d.

With Nickel-plated Number Plate Clips, or Handle-bar Clips, **6d.** each extra.

For fitting to Radiator Cap or Mudguard, **3d.** each extra.

ENGLISH, FRENCH, BELGIUM, RUSSIAN, Etc.

Any of the above Flags can be supplied in pairs fitted on one clip. **Price—the cost of two Flags and 6d. extra for clip.** (Handle-bar or Number Plate).

Owing to the abnormal demand for Mascot Flags, orders will be executed strictly in rotation.

SMALL SILK BUTTON-HOLE FLAGS.

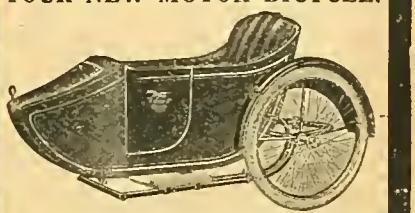
No. 106L. With Gilt Pin or Safety Pin Fastening. Price **2d.** each.

No. 106M. Cheaper quality .. .. Price **1d.** each.

Fast Colours—Real Silk—True Union Jacks. Postage 1d.

P. & P. ENGINEERING CO., LTD., ILFORD.

WE WANT YOU to FIT a SUPREME Sidecar TO YOUR NEW MOTOR BICYCLE.



Graceful, Low, Comfortable, refined in every detail, and after once lining up to machine you can detach or attach sidecar to machine in 30 seconds with the Supreme Lightning Connections.

Models from **£9** to **£14**

Cheap Petrol. How it would Energise the Motor Industry.

PETROL at a shilling a gallon! Would that this could become an accomplished fact! But has any reader stopped for a moment to consider what it would mean in the present state of affairs, how it would revive the motoring industry, attract new converts, and extend the uses of motor vehicles in scores of directions? Let us seriously ponder further over this bold suggestion. It is only a few years ago that petrol was sold in this country at less than a shilling a gallon, and that on a comparatively small output. Nowadays the price is 1s. 9d. per gallon, and at the moment people practising economy to the letter are constrained to use it sparingly. It seems to be the general belief that petrol is sold in this country at a ridiculously inflated figure. That may or may not be the case, but support is given to this assumption by comparing the present price with that prevailing a few years ago in connection with a small output—certainly not one-tenth of present-day consumption.

Supposing that a shilling a gallon for petrol *would* bring in a profit to the distributers, can any reader even imagine what might be the tremendous and far-reaching effects of such a reduction? First and foremost we must remember that the motor industry as a whole, representing millions of pounds of capital, is to a very large degree dependent upon petrol, and incidentally the controllers of that precious spirit. In other words, the actions of a comparatively small ring of petrol dealers could greatly affect —either adversely or otherwise by an increase or reduction in price—the entire motor industry. At the moment (though the supply of motor spirit has not so far been curtailed) the demand is considerably restricted, mainly owing to motorists holding up their cars and motor cycles, but also to the large number of public vehicles which have been commandeered by the War Office for use abroad and thus no longer run on our roads, and there is little prospect of an improvement in this state of affairs, in the immediate future at any rate. The petrol suppliers must know best to what extent the country has been affected by war conditions, and thus can gauge better than anyone how many in this country have for the time being dispensed with the luxuries of a car or motor cycle. And this country, it must be remembered, is the only one of those engaged in war wherein what may be described as normal conditions prevail. But the holding up of orders for new vehicles on the score of expense is a very serious matter.

Considerations such as these must convince any thinking person that nothing could conduce to revive normal conditions, in the motor world at any rate, more than a substantial reduction—say to a shilling—in the price of petrol. Indeed we cannot picture where the good effect of a price reduction would cease, for cheaper motoring would be bound to revive orders and business generally, seeing what a huge hold motoring has made on our business and private lives. As is well known, the motor trade rely upon a great many allied trades for supplies. The petrol companies are organised for a tremendous output and a marked reduction in the consumption of petrol must unquestionably affect their organisation seriously. Here is an opportunity of at least keeping the output at the normal standard, and in order to share in the inevitably increased business in motor vehicles and petrol, retailers must forego part of their profits per gallon.

Finally, we should explain that our suggestion, which is prompted by consideration for the general welfare of the motoring movement, is not made without the knowledge that our stocks of spirit are more than sufficient for ordinary needs. Board of Trade returns show that the record number of seventeen million gallons of petrol were imported into Great Britain during July last, and even during the first month of the war another twelve and threequarter million gallons arrived in this country.

Testing the Intelligence Department.

Scenes at the Examination of Military Riders in the Broad Walk, Kensington Gardens.

BEFORE war was declared the Broad Walk, Kensington Gardens, was consecrated to the use of nursemaids, perambulators, and children; save for baby carriages and an occasional cart belonging to the gardens, its gravelled neatness was never disturbed by vehicular traffic until it was devoted early last month to the parking of motor cars for the War Department.

A scene in the Broad Walk, Kensington Gardens. A candidate takes on the riding test.

The other evening near the gate opposite Prince of Wales Terrace were to be seen three Rudge-Multis in charge of mechanics from their makers' Tottenham Court Road depot. Rudge-Multis are the machines chosen by the War Office for the Intelligence Department, and several candidates for this important branch of the service were to be examined as to their technical knowledge. All had passed the languages test, but, unfortunately, linguistic and technical abilities do not always go hand in hand.

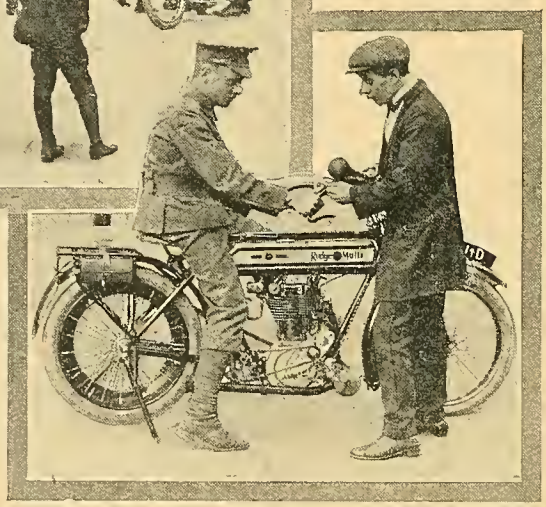
The Intelligence Department at Sea.

The examiner, Mr. Hugh Gregory, chief of the Technical Department of the Royal Automobile Club, asked No. 1 to show him the exhaust valve of the resplendent machine near which we were standing, and gave him a pencil the more clearly to indicate its position.

No. 1 took the pencil, scratched his head, waved the pencil about for some seconds, and then acknowledged defeat. He was sent back to the R.W. depot for further instructions. Yet, he told us, he had driven a motor bicycle a good many hundred miles, but when anything went wrong someone else had put it right for him.

No. 2 spotted the exhaust valve correctly the first time, and being asked how to remove it pointed out that the inlet dome was taken off. The examiner asked him if any other operation was necessary, but no reply was forthcoming. He was then asked what he would find to allow the valve to be taken out after the dome had been lifted off, to which he answered, a small screw. Sent back for further instruction.

No. 3 came up on his own machine and got through with flying colours. Next he passed the riding test, which consisted in his riding to the top of the hill and then describing the figure 8.



An Anglo-French Territorial receives instructions from a Rudge tester.

No. 4 found the exhaust valve without difficulty, also the float chamber and contact breaker. He was, however, rather hazy about the symptoms of a punctured float, could not accurately describe the adjustment of the platinum points on the C.A.V. magneto, though he knew the correct amount they should separate, and when asked where the jet was pointed to the petrol pipe union. Referred back for further instruction.

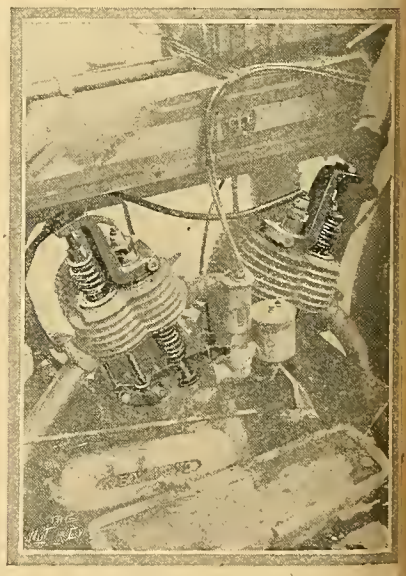
Then came his driving test. The mechanics showed him the control, and he started up the hill as Pullin did when he set forth to win the T.T. Nursemaids, children, dachshunds, and Pekinese fled for safety, and then returning at break-neck speed he skidded almost to a standstill, and thanks to the excellent Rudge clutch he just managed to execute an 8.

No. 2 distinguished himself by passing between a motor car, belonging to a friend of one of the candidates, and a seat on which several ladies were sitting, an exhibition which did not improve their peace of mind.

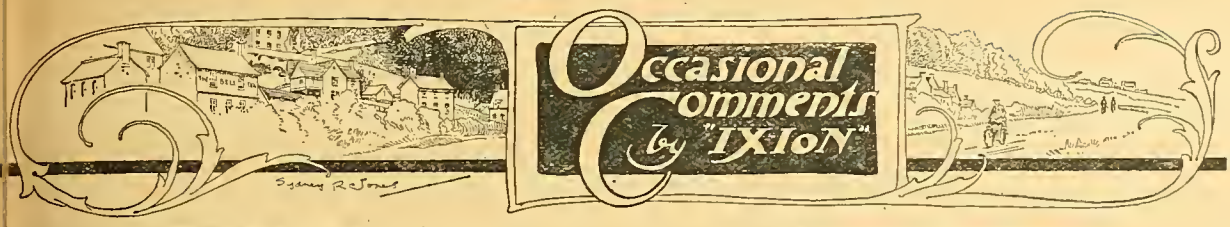
The last man to be examined charged down the Broad Walk at full speed, and, as he could not stop, the park keeper opened the gate and let him through. On being told all was over the two mechanics leaped upon their machines, flew through the gate, swung past an "island" in the street on which a policeman was standing, and left him and two park keepers speechless with surprise. It may be added that there are no vacancies in the Intelligence Department.

DE LISSA VALVES ON A REX.

Our photograph shows an interesting conversion from the standard poppet valve to the de Lissa type. The engine is a twin Rex, the property of Mr. A. Collinson, of 621 Manchester Road, Bradford Yorks., who is prepared to convert any machine to these lines under the de Lissa patents. It will be remembered that one of the main points of the de Lissa valve is that it keeps much cooler than the mushroom type owing to the large surface exposed to the air, and besides this its shape removes nearly all the pressure from the valve head, and consequently reduces the work on the cams very considerably but it needs a stronger valve spring. Incidentally the engine shown has been fitted by the owner with roller bearings to the connecting rods both in the big and little end bearings, a piece of work which requires considerable skill.



A twin Rex machine fitted with de Lissa air-cooled valves.



Rear Springing.

Whenever I allude to rear springing I am inundated with sympathetic correspondence. It is evident that there is no innovation on which the mind of the general motor cycling public is so firmly fixed; and one imagines with some vividness the groans and curses that have escaped the lips of the motor cyclist gallopers at the front as their rigid frames jar and bump over trench *pavé*, and over roads worn into incredible waves and potholes by the passage of innumerable military vehicles. Well, here is the trade's chance. There is a certain inevitable lull in production. Outputs must necessarily be reduced until peace returns; the responsible staffs, technical and otherwise, are relieved by a breathing space from the prolonged hustle of competition, production, and development. They have time to tackle such urgent problems, and the problem which I identify is far from insoluble—simply to insulate the rear half of the frame from violent road shocks, as the fore half has long since been insulated. We want a design that is not too obtrusive and ugly in aspect, that adds no absurd avoirdupois, and that is tolerably cheap to make. Are British brains unequal to the challenge? The firm which first meets it will reap rich dividends.

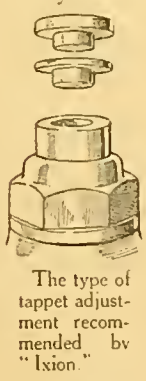
Weak Mixture and Misfires.

We live and learn. I have been trying to reduce the petrol consumption of an engine equipped with a magneto possessing a visible safety sparking gap. After various adjustments I thinned the mixture down a shade too much, and misfiring set in. I not unnaturally ascribed my trouble to the carburetter, but chanced to see the engine running in the darkness of its shed at night, and saw sparks leaping from the outside of the plugs to the engine. This captured my attention, and further research, aided by advice from a kindly correspondent, showed (a) that the plugs did not leak when the carburetter was furnished with a normal mixture, and (b) that when the mixture was weakened beyond a certain point, the spark at the plugs' electrodes ceased, and either a spark occurred at the safety gap in the magneto (with one type of plug) or between the outside of the plug and the cylinder (with a less strongly insulated type of plug). This looks as if a very weak mixture offered peculiar resistance to the passage of the spark, and that if a large advance in petrol economy might conceivably be obtained by using a heavier spark.

In this connection one remembers that this very claim has been advanced for the "B" spark of Sir Oliver Lodge's patented ignition. I regard the latter without great enthusiasm, because the present-day spark is quite searching enough for the present-day sparking plug, and I have no wish to use a stronger spark unless some genius provides a more resistant insulator than we possess as yet, or alternatively persuades engine makers to tap their engines for plugs of much thicker diameter.

A Curious Experience.

Here is a diagnosis for the experts. A Scott rider was compelled to remove his magneto by the roadside, and, in replacing it, timed it too fast. Being a novice, it did not occur to him to retard the ignition lever on hills; as the engine could just make shift with the surplus advance on the flat, he ran merrily on for a good distance, putting up with the knocking on hills. During the day's run he broke three sparking plugs. The Reliance plug is recommended for the Scott engine: it has a shielded porcelain butt to its insulation in which is mounted a very slender platinum-iridium wire electrode, which emerges through a tiny hole drilled in the centre of the metal dome at the business end. In each case the tip of the porcelain holding the electrode was broken clean off and shivered into fragments. After he retimed the ignition more correctly, a single Reliance plug lasted for thousands of miles. *En passant*, these Reliance plugs are "absolutely it" for smoky engines; they soot up less readily than any plug I know, and, thin as the central electrode is, it never seems to burn away.



The type of tappet adjustment recommended by "Ixion."

Adjustable Tappets.

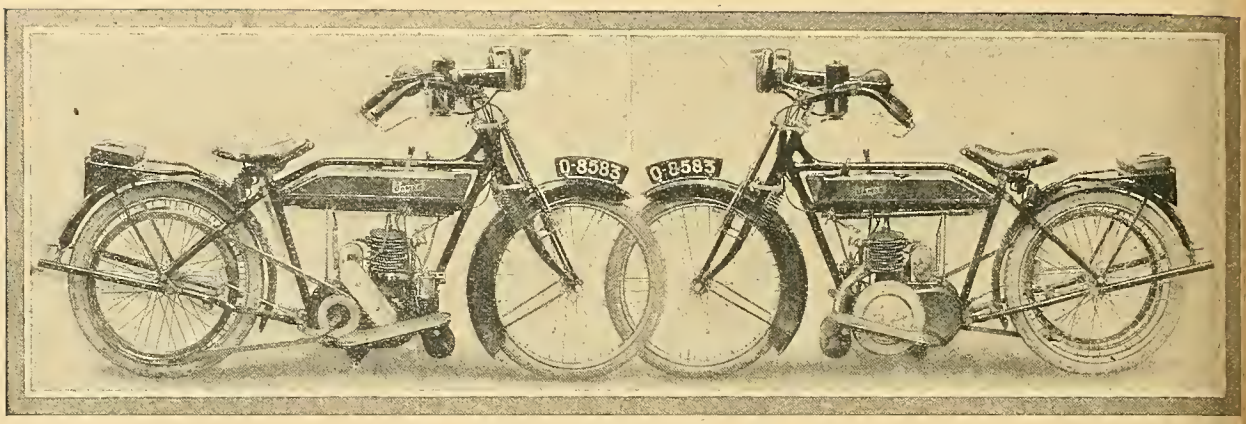
I illustrate herewith the type of adjustable tappet employed on a certain foreign cycle car. As the sketch shows, the tappet is very cheap to make, and the adjustment is made without the aid of tools by the substitution of a thicker capping disc. I think it is preferable to the usual type of adjustable tappet, which embodies two or three nuts, and is a fiddling thing to set.

A Small Self-contained Lamp Needed.

A special type of lamp is really needed for the host of cheap lightweights now flooding the market. It is only within recent years that a genuinely satisfactory lamp for the Douglas type of machine has been marketed, and these lamps are too bulky and expensive to suit the twenty-five guinea featherweight machine. I daresay there are suitable lamps in a few makers' catalogues, but up to date I have not encountered them. I was riding a borrowed 100 lb. two-stroke last week, and as I expected to reach my destination late at night, I sorted over my lamp shelf, but in vain. The smallest lamp it contained was a Lucas self-contained "Acetyphote," which was too heavy for the light tongue bracket. Before leaving the town I called at the two best local dealers; one had nothing between push bicycle lamps of the flimsiest character and the big £3 sets; the other had nothing smaller than the 30s. type, usually bought for 2¾ h.p. machines. I fancy the self-contained lamp may prove best suited to the little two-strokes; where weight is of importance one wants a lamp which can easily be removed on daylight rides.

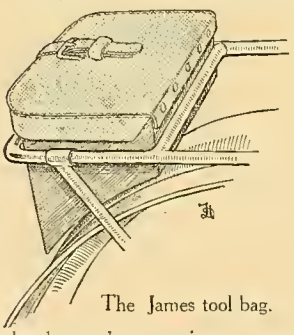
MACHINES ON THE ROAD.

THE 2¼ h.p. TWO-STROKE JAMES.



Both sides of the 2¼ h.p. two-stroke James.

WHENEVER it has been our lot to visit the works of the James Cycle Co., Ltd., at Greet, Birmingham, the roads have invariably been "up." Whether for sewers, water pipes, gas, or for the laying of tramlines, the fact remains that the roads were up. This has nothing to do with motor cycles, the reader may say, but in this particular instance it has, seeing that we started out of the James works on a two-stroke mount entirely strange to us, and at once commenced winding in and out a network of ropes and notices "Road up," often with less than the space of a yard between the roped off portion and the stone kerbing of the pavement. But this was no anxiety; in short, the controllability of the little James leaves nothing to be desired. Its control can be mastered by any novice in a few minutes. It starts with the greatest ease by a dig with the foot on the ground whilst sitting in the saddle, and we repeated this operation regularly during the time the machine was in our possession—no matter whether the engine was stone cold after standing some time, or warm after a run. It will crawl along on low gear two-stroking regularly by the simple expedient of retarding the spark lever and cutting down the throttle opening, and immediately accelerate when the throttle is opened. A blow-back or spluttering through the carburetter was occasionally experienced when the compression release was operated, but this failing applies to practically every two-stroke engine on the market, and the obvious remedy is to govern speed on the throttle only.



The James tool bag.

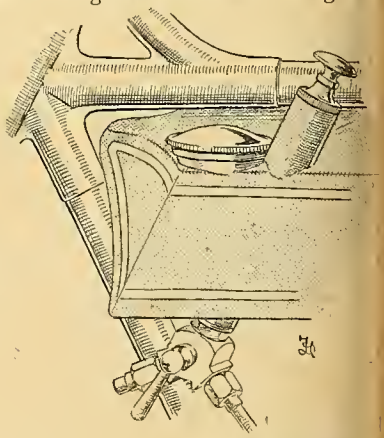
An Ordinary Stock Model for Trial.

The particular machine we sampled was not one got ready specially for test, but was in just such a state as we prefer to try new models.

Those who know Meriden Hill, on the Birmingham-Coventry Road, will gain some idea of its hill-climbing abilities when we state that it ascended this quarter mile rise of about 1 in 12 at 25 m.p.h.—on top gear of 5½ to 1, of course. As a matter of fact, we formed the opinion that a slightly higher ratio for the top gear would be an advantage, as when travelling at full speed on the level vibration in the handle grips and footplates made its presence felt. It would be a difficult hill that could stop a 226 c.c. two-stroke James with its low ratio of 10 to 1.

A Well-protected Mount.

What particularly impressed us about the James was its cleanliness. Large and efficient mudguards with side extensions, an enclosed flywheel and footboards of large dimensions, combined to screen the rider very thoroughly, so efficiently indeed that we found that legging overalls were unnecessary for short runs.



Two-way oil tap on the James lightweight

The riding position of the two-stroke James has been well studied. The handle-bars are of large size and gracefully swept back to allow a natural pose with the result that one does not get tired even after long runs in the saddle. The detail work generally is very good. The lubrication, it may be mentioned, is by the "petroil" system, that is, the usual mixture of petrol and oil, but we like the idea of an auxiliary pump direct to the crank case so that one may inject an extra charge of lubricating oil if deemed desirable. In a word the James is a very attractive town mount on account of its extreme handiness and low build, and it is nevertheless able to average a speed of nearly 20 m.p.h. over give and take roads.

A DASH FOR LIBERTY.

Thrilling Adventures of a Scott Rider in Germany and Belgium.

(*Concluded from page 354 of the last issue.*)

THE bicycle was far more serious. A couple of spare sparking plugs excited suspicion, and the defenders of the Kaiser involuntarily stepped a ce back when by negligence I dropped one on the ound. The tank was believed to have a double ttom. Every possible thing was dismantled. The nerator of the lamp went to bits and the carbide d to be put very near several noses to convince erybody that it was not explosive. These were tails, but when the old sergeant insisted upon my king off the cylinders I went on strike. After a ng talk he was satisfied at seeing the pistons move and down. Once having to remove the sparking ugs it seemed a kind action to show him what the rt he had previously doubted was there for. A rn of the kick-starter produced the spark, but in- ead of clearing matters it complicated them, and other lecture was needed to clear myself.

Unpleasant Advice from the Mob.

All this took place in the yard of the village school. uring the examination the crowd had climbed the rrounding wall and were hurling advice at the *ndarme* and compliments at me. Russian spies had isoned the waters in Mainz the day before, and venteen were to be shot that evening. This did t improve the temper of the population of the dis- cts, and when my identity had been fully estab- hed I resolved to get back to Mainz and take a in to the frontier rather than risk another such p which might not end so well.

At Mainz I found a train as far as Cologne; with ck I should find one there to take me further, t the railway company refused to forward y machine. This was most distressing, and little little it dawned upon me that I had only dertaken the journey because I objected to English bicycle being the means of rendering vice to an enemy of my country, as would have been e case had I remained or left it behind.

Petty Officials to be Avoided.

During the whole of the journey I had found that e higher placed the official, the more agreeable it s to deal with him, and, therefore, determined to straight to the commanding officer of Mainz and im the safe passage which my military passport aranteed but could not enforce. The old "Platz- mmandant" (commander of the town) was awfully e and gave orders that my mount was to be taken far as the Belgian frontier. All went well until logne, and here difficulties recommenced, the tionmaster flatly refusing the assistance of porters transport the bicycle from one train to the other. t seeing the weight and thinking no doubt of the irs to be gone up and down, he informed me with ironical smile that I might do the job myself. Two ssengers were soon bribed to assist me, and together managed to get it into a luggage van just as the t train was leaving for Herbstal. So close had been shave that we were forced to stay in the luggage van til the next station was reached. The train journey was uneventful. Passengers were informed that any open window near a bridge or tunnel would be shot at without warning and that certain compartments were not to be used.

Over the Belgian Frontier.

At the frontier station the officer in command made a last gallant stand to detain the machine, and it needed many words to convince him that it was no use trying for a thing which had failed so far. With a sarcastic remark about not finding any fuel I was allowed to pass. Luckily I speak English, French, and German equally well, and once on Belgian soil my English nationality, as well as the command I had of the French language, procured me a good reception. A Belgian gentleman was only too glad to give me the little petrol he could spare. This would save me from the Germans, he said, and further from the frontier there would be no difficulty.

Ultimate success now seemed sure, and I felt more at ease than I had done for a long while. Before riding off I could not conquer the desire to bid farewell to the German officer who so generously had let me pass because he was convinced that lack of petrol would prevent my getting away. He was soon found again, and with the engine running very smoothly I thanked him for letting me through. He did not wish me "*Bon voyage.*"

The railway line to Verviers had been taken up, and the road was full of people who were forced to proceed on foot. Just before Verviers a heavy barricade made me turn back. This was a different thing from that which had barred the way in Germany A couple of upturned carts placed across the road, a few felled trees, and yards of barbed wire were stretched from wall to wall.

After a short search some sort of cart track was discovered which seemed to lead to the town. It was tried like other ones had been before, but it was frightful. About fifty yards down I met a peasant who informed me that the track led to Verviers, but that I would never get there. "Why?" '*Parceque vous allez vous cassez le cou*" ("Because you will break your neck"). To be sure, there was a chance. The surface was abominable—ruts, holes, stones, and a gradient which must have been at least 1 in 4 in several places made me fancy myself riding in the A.C.U. Six Days Trial.

Running the German Gauntlet.

In the town all the shops were closed, but a chauffeur consented to let me have some petrol. While praising my luck and filling up, I saw, to my dismay and disgust, that German troops were in possession of the main road and were marching on in an endless stream. This not only made the main road unrideable, but, as the inhabitants told me, would make progress impossible. The marching column had to be crossed somehow, so I waited in a small bye-street with the engine running, and as soon as a somewhat larger space than usual between two guns seemed to justify the attempt, in went the clutch. There were

A Dash for Liberty.—

shouts, and I had the impression that the horses towing the next gun made movements other than were necessary merely to pull their load. The clatter of hoofs proved beyond doubt that some horsemen were giving chase. I don't think that I ever opened the throttle with such a jerk. The machine fairly leaped up the long hill in front of me, and by the time the next corner was reached the sound of hoofs had become fainter. There was nothing to fear except that it might occur again.

So near and yet so far!

How now to get to Brussels? The distance was nothing, about eighty miles. Leaving the main road did not worry me much. I had picked my way over many a mile the day before along byeways and lanes to avoid forts and too frequent stops. The proposition now, however, was different, as wherever I turned the road was barred by felled trees and such like. My military passport had run out when crossing the frontier, and the only permit I had was a paper given by the Customs officer, allowing me to go as far as the first Belgian military post (not much use in time of war).

I had a vague idea what direction to take and rode on, most of the time along the ditch lining the road. When this became unrideable whatever happened to be the other side of the ditch had to do. As often as not this was field; if so it was always protected by a barbed wire fence.

A Regular Cross-country Scramble.

Scruples about cutting the wire soon vanished, and a new pair of pliers did the work beautifully. How the bicycle did not drop to pieces sometimes I failed to understand; the strain, especially on the front forks and frame, must have been tremendous. Sometimes the poor machine was ridden through meadows, sometimes through woods, then again I would find it possible to make use of the road. Thus I kept on, but the job was getting tiresome. I had scarcely tasted any food since Sunday lunch, and had had no sleep since Sunday morning. It was now near Tuesday noon, and no wonder that the strain began to tell. The worst thing was that no end to all these obstacles could be seen. I had stopped counting the times which the luggage was unstrapped to lift first the machine, then portmanteau over a felled tree or something equally objectionable. Once a patrol of guides came up and one man dismounted to help. Once a Belgian artilleryman hurrying to his regiment gave me a lift when I was near giving up. But as long as a drop of petrol remained there was hope, and as long as there was hope the struggle would last. In the morning I had dreamt of lunching in Brussels, but now I dreamt of lunching anywhere.

Information about the Enemy.

About eleven o'clock saw me in Longwy, the outpost of Belgian lancers. A short examination convinced the commanding officer that my hatred for the Germans was as strong as his, and I was questioned

"Just before Verviers a heavy barricade made me turn back. . . . A couple of upturned carts placed across the road, a few felled trees, and yards of barbed wire were stretched from wall to wall."

Dash for Liberty.—

bout the German movements. The little informa-on I could give seemed useful, and was at once wired o the rear. At the town hall a passport to Brussels as made out and things once more looked rosy. oads were now free, at least compared with those hich had been left behind.

Arrested by the Belgians.

Next stop was to be Liège. I managed to pick my ay through the line of forts in front of the city, nd at one o'clock entered Liège itself. With visions f dinner at Brussels I rode on, but while trying to et past the second line of fortifications a lieutenant rrested me as a suspect. By persuasion of a revolver soon gave up my machine, my eyes were bandaged, nd I was marched to the fort of Hologne. The rowd at once sprang up, and the murmur getting uder showed that it was increasing. A stone on my ead proved that its mood towards me was none too iendly.

Arrived at the fort, the customary examination by e commander followed, and then, with my eyes still ndaged, I was led to a cell, handcuffed and guarded a man with a loaded rifle.

Apart from these rather vigorous measures they eated me kindly. I was allowed to smoke and given me water to drink. The commander paid a visit d gave strict instructions that I was to be treated urteously. This consideration must have been the sult of mentioning a few well-known families in russels, a photograph of a Brussels hockey team th the son of the Minister of the Congo sitting next me proving especially convincing. There seemed be doubts, however, and the commander of the *ndarmerie* was summoned. While waiting the alarm ng out. Doors were slammed, troops could be ard rushing along the passages and forming up in e yard. Orders were given, and all the while the gle sounded. I felt distinctly uncomfortable. The rmans could not be far off, and to be detained as a spected spy during the bombardment in a fort might exciting, but it was not what I desired. My fears re soon put at rest. The chief of the *gendarmerie* rived and took me off in an enclosed car to the adquarters. Another cell, another wait, another amination and search and, finally, the news that the cycle was to be confiscated and I would be taken to ège to be court-martialled.

Rough Reception at Liege.

Still handcuffed they drove me back to Liège. re things became serious. It was getting dark, and ng the lighted streets the Belgian troops were rching on to the fight. The car had to stop. ring half an hour we waited, all the while the diers passing, cheering and being cheered by the wd which packed the streets. With one breath i cried, "*Vive l'Armée, vive la petite Belgique*" (Long live the army, long live little Belgium"); in t next, "*Mort à l'espion!* ("Death to the spy!") At the beginning of my ride I had found it ticklish rk to look down the muzzle of a loaded rifle, but v I found that to face, handcuffed and utterly pless, a howling mob which considers you a spy s a far more serious proposition. Had not my two rds drawn their pistols and offered to shoot the t man who came on the car there would have been nothing of me left to prove my identity. It seemed ages before we moved again, and when we landed at the Palais de Justice there was only the *concierge* to be found. He seriously advocated that I should be shot at once. "*Il faudra le fusilier de suite,*" and I was too tired out to answer anything else than "*Vous êtes trop aimable, Monsieur.*"

Then we had another drive through the mob, this time to the headquarters of the *garde civic*. Here the thing was done in style, and the scene seemed most realistic. A group of officers were seated around in a semicircle, in the centre of which was standing the prisoner, still handcuffed and looking very dirty and fagged out. A guard was on each side. The cross-examination that followed was extremely lively, but things went well, and after about ten minutes I was a free man again.

Free Once More.

A *permit de voyage* was made out by the commanding officer of the *garde civic*, and with another interesting document in my pocket I went in search of an hotel. Wednesday morning an early start was made for the Hologne fort to get the machine. While attempting this I was only arrested once. By midday all the formalities had been gone through, and soon the engine was humming merrily, but it was not to last long. Barricades caused trouble, and houses along the roads being blasted to give better views for the artillery were a sad sight.

At the second line of forts there was another check. A sentry led the way to the officer in command, who immediately decided that my papers were too good to be true and ordered a search. The usual questions were asked, and when it came to light that I held a German degree of engineering someone remarked, "He is a German engineer, that's enough." I was not handcuffed or blindfolded this time, merely placed with my back against a wall and guarded by a man with a rifle. The crowd once more had the pleasure of viewing "a German spy" for half an hour while the *gendarmerie* was summoned. At the headquarters a telephone call soon put matters right.

The Sound of the Big Guns.

By now I had got heartily sick of these hold-ups, and decided to finish the last fifty miles to Brussels by train. It was near the evening of the 5th then, the guns could be heard roaring, and, as I learnt later, the front line of forts was already stemming the German advance.

The siege of Liège had commenced, and a few more of those checks could get me into a more serious position than I had any wish to be in. The remainder of the journey is of no interest. Steamers from Ostend to Folkestone were running, and soon I set foot in London town.

But all my troubles were not at an end. After reaching my home in South Wales the story of my escape from Germany soon got about, and the police promptly informed me that, having been born in Germany, I must be a German. I asked if being born in a stable constituted being a horse?

I have only one regret. My poor motor cycle, to which, besides my life, I owe three of the best days' sport I have ever had, is still in Brussels, and though it is stored away in a cellar I tremble when I think of it, defenceless in a city held by the enemy. W.S.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Sidecar Mudguards.

Sir,—I was much interested in "Ixion's" remarks about broken sidecar mudguards in your issue of September 3rd. In eighteen months the stays on my sidecar guard have broken four times. After a stay made especially for me had broken, I decided to try and fix a light sheet metal flat guard to the chair, which is wicker. This can be made to look quite neat, and is very light, and does not shake to pieces. It is made of sheet iron bent over at the edge and fixed to the chair by means of light metal angle brackets. There is plenty of clearance between the wheel and guard, but, of course, this would not always be the case with low racing sidecars. EAST ANGLIA.

The Buttress, Hebden Bridge.

Sir,—In reply to the article, issue of September 10th, describing Mr. Maurice Greenwood's ascent of the latest freak hill, known as Naze Hill, at Todmorden, I beg to inform you that I climbed the said hill on August 14th; therefore I claim to be the first to climb the hill. Also I should like to mention that the machine that I rode was 2 h.p. less than the one my friend rode, my machine being a 6 h.p. Bradbury with sidecar and 11 stone passenger.

He also states that he filled up the ruts, which were a good 7in. deep, to avoid breaking the sidecar frame. I did not do this. I jumped them just as they were, not having examined the hill first, thus proving that the Bradbury will stand hard usage. Then I took it across the moor when I had ascended the hill, and got across without any assistance whatever.

In reply to a letter received by you from "W.L.," I beg to inform you that I successfully climbed the Buttress on a 6 h.p. Bradbury and sidecar with an 11 stone passenger. The gears used were 4¾ to 1, 8 to 1, and 14 to 1. The tyres were Dunlops, 650×65. The hill was ridden under ordinary touring conditions.

I send two photographs of the machine ascending the hill, and you will see from the surrounding houses the big rise that the hill takes in a very short distance. The hill is almost half a mile long, and has never been climbed before with a sidecar. WILL GOODWIN.

The Difficulty of Hearing Sentries.

Sir,—For some time past there have been various instances of motor cyclists being shot at by sentries, sometimes even fatally. Do you not think something should be done to try and prevent this? For example, imagine yourself on a big twin, having a ride on a good road at night, with your head lamp burning brightly. As you come past the sentry he jumps out and shouts "Halt!" but owing to the noise of your exhaust and the metallic rattle of your machine on the road you cannot hear. The next thing is the hospital or elsewhere.

Now, I think you will agree with me that it would be better if something were done. For instance, a red light might be placed in the road where the sentry is; this would necessitate the drawing up of cars and motor cycles, and then the riders might have a chance of hearing or seeing the sentry. RED INDIAN.

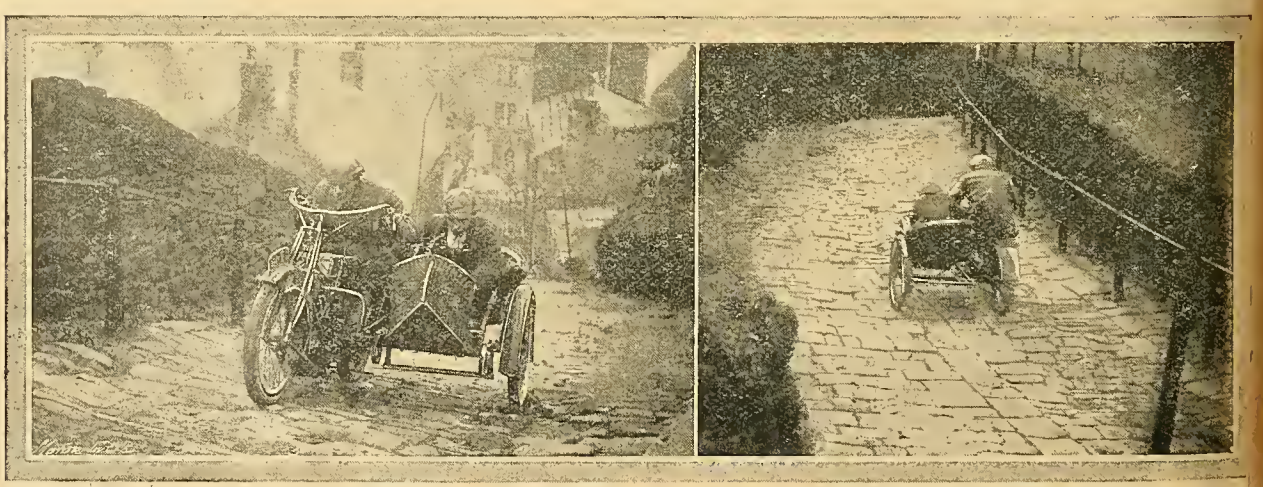
"Wake Up, England."

Sir,—I have been glad to see so many articles and letters in *The Motor Cycle* advocating the pushing of British trades in foreign markets. By all means do so; but do it at once.

Why does the average American succeed where (I regret to say) most of us Britishers would fail? Simply because he sees his opportunity and embraces it, and is content to make things to his customers' specification and not to dictate to him.

Sometimes our friend "Ixion" apologises for his growls. May I do so now for mine? If English firms want to capture foreign trade they must be prepared to supply goods more promptly than they usually do to us here in Ireland. For many years I have bought things direct from English manufacturers, and in every instance except two (Sturmey-Archer and Wolf) I have had to wait for a long time before I received the goods.

I once sent a small repair to a large Birmingham firm, and had to wait for seven months before I received the part cleaned and polished up nicely, but not repaired. I at once started and made the whole affair from A to Z. I had only a small forge and a foot lathe to help me, but in a little less than three hours I had the job finished.



W. Goodwin ascending the Buttress, Hebden Bridge, on a 6 h.p. Bradbury sidecar (see letter).

Experience has taught me that new firms who have not yet made a name will go to a great deal of trouble to oblige a customer, and will supply goods promptly, while the larger and older firms do not seem to care whether small orders are ever filled or not. Of course, there is some excuse at the present time, but I have always found it the same.

Would it not be wise to be a little more prompt? Certainly, if we wish to compete with our American friends we will have to buck up. Of course, the high quality of English-made goods counts for a lot, but customers do not like to be kept waiting indefinitely. I quite agree with "Made in England." There is no reason why this country should not be supplied with home-made magnetos. All success, say I, to the B.T.H. and other companies.

H.H.B.

The Size of Tyres.

Sir,—Not long ago I bought a lightweight, which I have since disposed of. It was cheap, and, as I found out later, nasty. One of my troubles was a tyre which wore down to the canvas in nine hundred miles! I wrote to the tyre company (a well-known firm), and received a letter stating that if I sent them the unsatisfactory cover they would see what they could do for me; they also said my cover was for machines up to $1\frac{3}{4}$ h.p. (My machine had an engine of $2\frac{1}{2}$ nominal h.p.) I was very surprised at hearing my tyre was too small for its work, and wrote to the tyre company asking why they supplied an undersized tyre. I received the following answer:

"We supply the —— Co. with the tyre in question because it is our business to execute orders which we have the pleasure to receive from manufacturers, and we are only their servants in the matter."

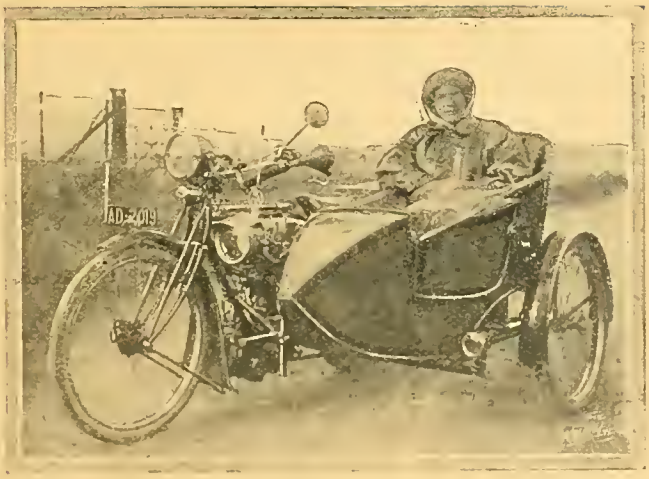
I would much rather have paid half as much again for a really good machine. We now see why "cheap" machines are cheap—at the expense of quality. I do not infer the tyre was not of a quality suitable for $1\frac{3}{4}$ h.p.

UNDERTYRED.

[We have repeatedly urged upon our readers the necessity of using tyres of adequate size and strength. It is not fair to blame the tyre maker, who, naturally, supplies any tyre asked for by the manufacturer of the machine. The buyer can always specify a large tyre. This adds to the first cost, but is an economy in the end.—Ed.]

Electric Lighting.

Sir,—I enclose herewith a photograph of my 1914 Triumph and sidecar. The sidecar, rear and head lights are electrically lit. Sidecar, rear and speedometer and watch lights are four volts and head light eight volts. The current is supplied by two accumulators of four volts each, the second accumulator being used only for obtaining the eight volts for head light. These accumulators stand up well to their work, and have given complete satisfaction. Besides the light the accumulator supplies current for an electric horn, operated by a push button from the sidecar. The lamps are all F.R.S. lamps; the centre one is the acetylene 1,000 foot F.R.S. That lamp alone gives a most magnificent light, and enables one to keep a very good average during night runs. The machine runs and pulls exceptionally well, and keeps up a very good average. I forgot to mention the lights are all controlled by switches. The accumulators are carried in a tin box under the sidecar, which prevents them from being jolted too much.



A reader's Triumph sidecar equipped with electric lamps. (See letter.)

AN ELECTRIC LIGHT ENTHUSIAST.

What is the Ideal Frame?

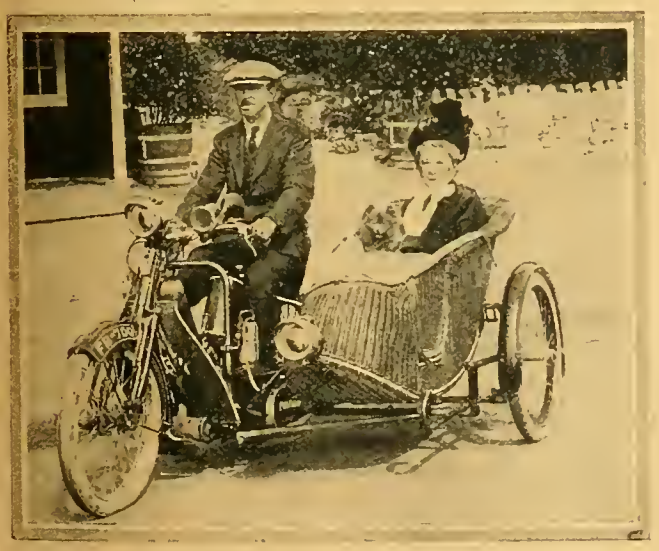
Sir,—Though not as yet an owner of a motor cycle, may I have the liberty of expressing my views through the medium of your columns? Perhaps the most notable change in frame construction is the new model made by the New Hudson Co., with the engine, magneto, etc., designed as a single unit. Is not this the ideal frame? I should be much interested to hear the views of your other correspondents on this matter.

C.F.C.

The Latest Recruit.

Sir,—In these exciting times of "enlisting," the accompanying picture may be of interest as showing what is really possible in the way of recruiting. My respected relative, at the great age of 95, forsakes her bath chair for the more comfortable properties of a Mills-Fulford Cabrio sidecar, and enjoys her morning drive on the sea front with no restriction on the speed whatever. The sweet running of the Scott at any speed from three to forty miles per hour is perhaps the greatest factor in bringing about this "capture."

Bournemouth. R. F. G. KELLY.



A 95 year old passenger on a reader's $3\frac{3}{4}$ h.p. Scott. (See letter from R. F. G. Kelly.)

Wanted—a Three-speed Pedalling Gear.

Sir,—A very light motor cycle, if aided by pedalling, can go practically anywhere, and, as a general thing, it is only now and then that such assistance is required. Moreover, it is surprising what slight assistance is required. The real difficulty is that the gear of the pedalling is very low and one cannot pedal quick enough to keep up with the engine. Two or three speeds are required—the low gear to start on and the middle and high gears for use to reinforce the engine on hills and against wind. This would make an exceedingly light and handy and yet perfectly effective cycle, and the occasional pedalling would be a welcome break in the monotony of riding and also afford a little exercise, the absence of which is the great drawback to motor cycling for recreation. But where can such two or three speeds be got? The spindle or axle of the ordinary pedal hub gear is too short, as the belt rim has to be allowed for. Can anyone help?

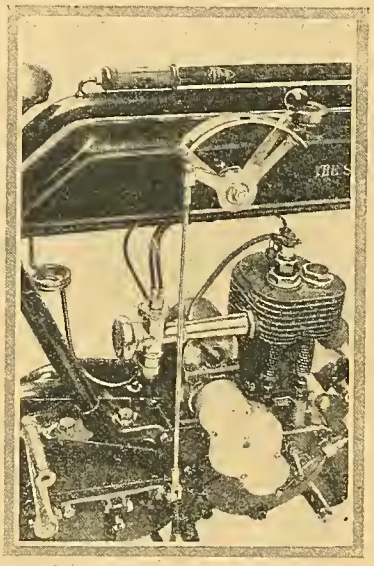
W.D.H.

The 2¾ h.p. Sunbeam.

Some Notes on the Running of a 1914 Model 350 c.c. Motor Cycle.

WE have already commented in these pages on the good running of the 1913 2¾ h.p. two-speed Sunbeam, and so well were we impressed by its capabilities that at the last Olympia Show we placed an order for one of these handy little mounts.

This fact alone will show that the question of reliability was not worth bothering about, because it will easily be imagined that reliability is a *sine quâ non* in a journalist's mount. Our faith in this branch of the machine's good points has been fully justified, and never have we suffered from any involuntary stop on the road, save for one puncture after about 2,300 miles' running. Incidentally, as showing how large a part luck plays in tyre troubles, we may mention that this was our first and last stop for tyre trouble for three years. True, we select good tyres and keep them properly inflated, examining them frequently with a view to extracting any flints which may have become embedded in the tread, but it probably points also to the fact that the 2¾ h.p. Sunbeam is light on tyres, despite chain drive. However, we have never inclined to the belief that chain drive *per se* is hard on tyres—and indeed when running under the ideal conditions provided by the makers of the Sunbeam, and assisted by the beautifully sweet clutch, it is as gentle and smooth a transmission as any belt.



The 2¾ h.p. Sunbeam power unit showing kick-starter.

Of this clutch we really cannot speak in too high terms of praise, and it has made us a determined advocate of hand control for this important part of the mechanism, the advantage of having both feet free to steady the machine being obvious to all. Gear changing is quite easy if just a slight pressure of the finger is applied to the clutch lever, and it is quite unnecessary to raise the exhaust lever at all or even to throttle down the engine.

Of the engine, all we need say is that its pulling powers remind us more of a good 500 c.c. rather than a 350 c.c. which it is. It possesses great powers of acceleration; and the Amac carburetter also allows exceedingly slow running to be indulged in when required. The kick starter, entirely enclosed in the chain cases, is easy, handy, and sure in action, and very substantially constructed. Mention of the chain cases compels us to say that these fitments take rank with anything on the market. It is an exceedingly difficult matter to design chain cases which are oil retaining, silent, and easily detachable, and probably not more than about half a dozen firms have really succeeded in perfecting this part of the machine. Indeed, the designer of one of the finest chain-driven motor cycles on the market confessed to us some time ago that he found greater difficulty in making a really satisfactory job of his chain cases than with any other part of his complete machine.

Let it be said that the Sunbeam designers, with their vast experience of manufacturing oil-bath cases for the chains on their pedal cycles, have succeeded at the first attempt with this tricky part of the motor cycle, with the result that the transmission on our machine is silent, clean, and wonderfully efficient.

An All-weather Machine.

Although tall beyond the average, the writer finds the riding position very comfortable, and in no wise cramped. Instead of the usual footboards, footrests were selected which, if not quite so cleanly, are to the owner's mind, more comfortable and neater in appearance. The handle-bars are of the semi-T.T. pattern, and give a riding position which is easy and provide complete control on the greasiest or roughest roads. One of the points that pleases us most is the almost entire absence of nickel plate. Handle-bars, hubs, footrest bars, fork springs are all black, and the general finish is black with fine gold lines, which is very smart and does not necessitate any undue amount of elbow grease when cleaning takes place, an occasion, we regret to say, rarer than the use of such an excellent mount warrants. The 2¾ h.p. Sunbeam is an eminently workmanlike job, and is most sturdily built throughout. The disposition of the counter-shaft gear box close behind the engine gives it an excellent feeling of good balance on bad roads, and any undue bouncing of the back wheel is obviated, thus adding to the comfort of the rider and the longevity of the 2¼in. Bates tyres with which the machine is shod.

A Little Criticism.

On the principle of giving all the points of the machine, we will here add a little minor criticism. Our only grumbles are that the orifice to the tube

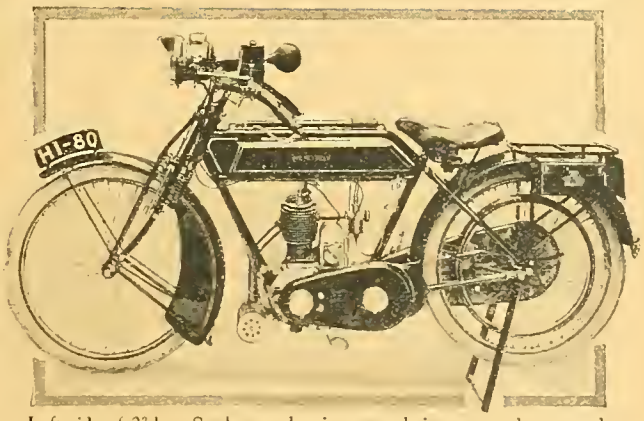
Meteor Works, COVENTRY.

The 2¾ h.p. Sunbeam.—

through which oil is poured to the gear box is not larger, so as to expedite the injection of the lubricant, and that there is no left and right-hand thread adjustment provided on the rod from the lever on the quadrant to the gear box. If there were one it would simplify gear adjustment, and would not necessitate the removal of a nut and bolt at the end of the rod as at present. This is a minor point, but when one possesses such an eminently high-class and high-priced machine as this, one has, perhaps, a right to be ultra critical.

In all other respects we can only say that the 2¾ h.p. Sunbeam in every way fulfils the very exacting demands we have put upon it, and that is about as high praise, in a few words, as we are able to bestow on any machine.



Left side of 2¾ h.p. Sunbeam, showing neat chain cases and protected position of magneto

The Motor Cycle Export Trade.

An Interesting Report showing where our Manufacturers may extend their Activities.

A REPORT giving comparisons of export trade done by Great Britain, Germany, and Austria in motor cycles and parts thereof to various parts of the world has been issued by the Commercial Intelligence Department of the Board of Trade. The figures available relate to the year 1912 as far as Germany is concerned and to 1913 for Great Britain and Austria.

Needless to say, the great bulk of trade in motor cycles all over the world, except in the United States, where they are fully capable of supplying their own market, is done by our own manufacturers; but all the same, quite a considerable amount of business might still be secured which has up to the present been held by Germany. To Norway, Sweden, Denmark, Portugal, and Russia, Germany exported in 1912 a total of 1,417 machines, valued at £57,450, together with a considerable number of parts, and this trade, in addition to that secured by our enemy in the British Empire, might very well, in the opinion of the Board of Trade, be annexed by our own manufacturers.

Austria has very poor figures to show, her grand total of machines exported to all destinations only amounting in 1913 to some 157 machines and some parts, together worth £6,690.

A Valuable and Growing Market.

South Africa has for some years been our best customer, and the figures giving the value of the imports of motor cycles from all sources to that Union from 1908 to 1913 are so remarkable that we reproduce them herewith:

	£
1908	10,634
1909	12,743
1910	22,031
1911	72,938
1912	154,236
1913	225,524

The United Kingdom has been far the greatest exporter, and her share of the trade represented by the figures above has been over 90% for the past four years. It is interesting to quote an extract from a recent American Consular report: "In South Africa the popularity of the motor cycle is growing with remarkable rapidity. The imports run to about 100,000 dollars (£20,833) annually, and are increasing. A somewhat less expensive machine than that now on the market is desired; it should be of 3½ h.p. or more, with an especially strong frame, powerful spring forks and brakes to suit rough roads, chain instead of belt drive, and general ease of control."

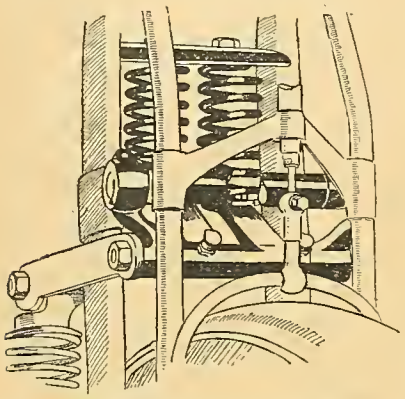
This shows that our American rivals are keenly seeking to fill this valuable market, and Japan is another country where they have actually made headway at the expense of the British manufacturers. The British Commercial Attaché at Tokio, in his report on the trade of Japan in 1913, states that the value of the imports of motor cycles was only £6,900 in that year, as compared with £9,800 in the previous year. The imports from the United Kingdom diminished by £2,800, while those from the United States and other countries increased. This seems a market which our manufacturers might well seek to regain.

Miss D. B. Everdell, the first lady motor cyclist in Stamford, on her 2¾ h.p. free engine Singer. This lady is quite an enthusiast and, we are told, thinks nothing of a run to London.

NEW DESIGN DRUID FORKS.

Backward and Forward as well as Vertical Movement Possible.

THE Druid spring fork, the most extensively used shock absorber on motor cycles, has stood the test of nearly ten years' use in practically every country. How well we remember early in 1906 the late Mr. A. Drew calling at our offices with one of these forks attached to a 3 h.p. magneto Singer, and demonstrating its efficiency

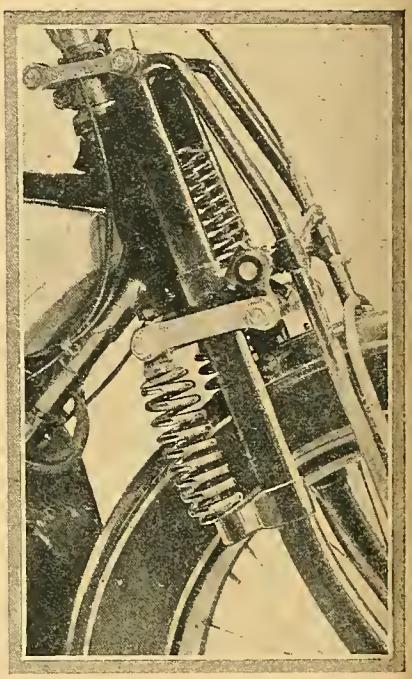


Showing the action of the latest Druid spring fork.

to us on a piece of rough paving near our offices. Now, nearly ten years later, an improved type of fork has been introduced, with the object of overcoming the dithering or bouncing action which users of Druid forks well know occurs when striking a rough stretch of road at speed. The characteristically neat appearance of the Druid fork has been in no way affected by the provision for combined action of the forks—which is the feature of the latest design—indeed, one might not notice at a cursory glance that the new forks are different from the standard type.

The action of the new fork is particularly neat and simple. The top links are attached as usual, but the forward ends of the lower links, instead of being pivoted to the main fork, are attached to a floating bar which is pivoted to the fork at the bridge piece, its movement being governed by a pair of coil springs acting on arms formed with the floating bar. The construction, therefore, permits of a slight forward and backward movement of the wheel, while the normal Druid up-and-down motion is retained in the usual way. A neat bridge piece is formed to take the brake stop, and the shoes are arranged to permit of quick detachment of the front wheel.

We have tried this new fork on a 6 h.p. A.J.S. sidecar outfit, both from the sidecar seat and from the driver's saddle. We were interested to observe from the sidecar seat that the springs were all the time on the move, absorbing large and small pot-holes as they were encountered. In the driver's seat one noticed the unusual effect that any jolting from the handle-bars was less pronounced than in the case of the saddle, and it will be agreed that to obtain this effect, provided a good saddle is used, the forks must be remarkably efficient and the springs of the correct tension for the load. The upper pair of springs are three inches in length; the increased weight is only two pounds, and the extra cost will, it is expected, amount to about ten shillings per fork.



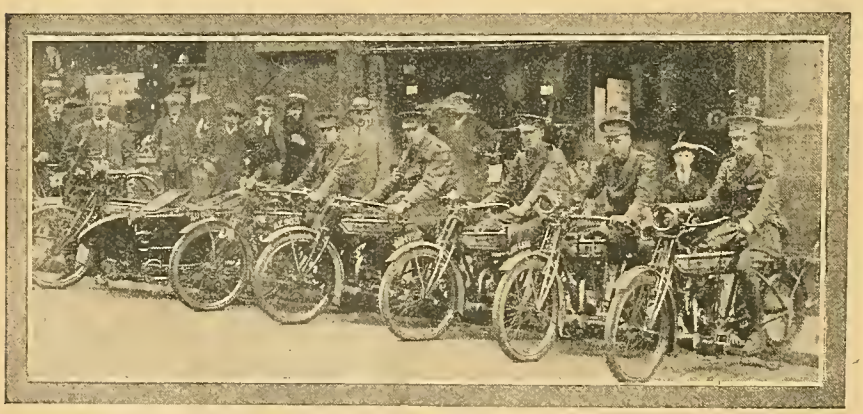
The latest Druid spring fork which has four springs.

Auto Cycle Union Notes.

MEMBERSHIP OF THE A.C.U.—As a special inducement the Auto Cycle Union has decided to give motor cyclists the facilities of membership to December 31st, 1915, upon payment of one year's subscription; thus motor cyclists joining at the present time will receive the facilities of membership for a period of over fifteen months for the one payment. We are informed by the secretary of the Union, that, despite the prevailing circumstances, the influx of members during August has been extremely gratifying. In addition, the North-Eastern A.A., which has a large motor cycle membership, has also become affiliated to the Union.

CLUB SUBSCRIPTIONS TO NATIONAL RELIEF FUND.—A suggestion has been made by the Nottingham and District M.C.C. to the A.C.U. that a subscription list should be opened to which clubs affiliated to, and members of, the Union should be invited to subscribe with a view to handing over the proceeds to the Prince of Wales's Fund. The Nottingham Club has offered to head the list with a substantial donation, but, in view of the fact that several clubs and members have already contributed to the fund, the Union has requested the club to subscribe this amount through the local facilities provided for subscribing to the fund, and the Union expresses the hope that this example will be followed by all other motor cycling clubs.

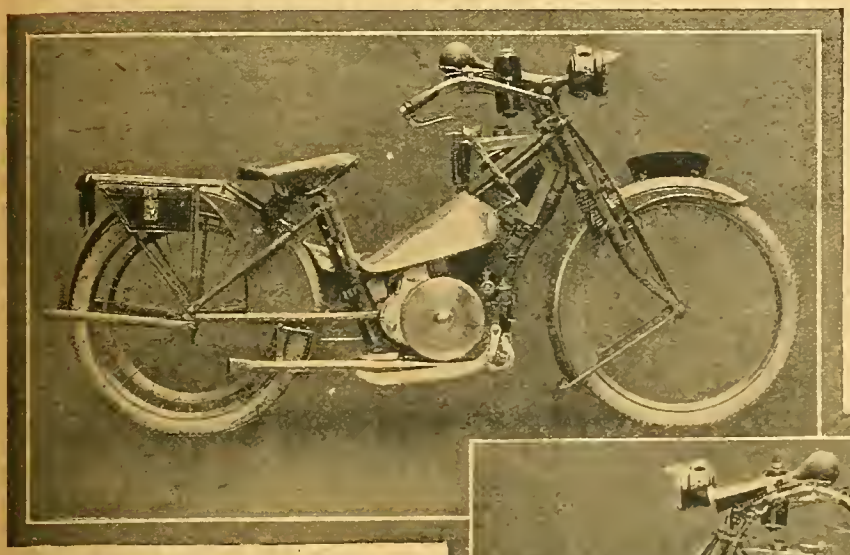
AUTUMN ONE DAY TRIAL ABANDONED.—Although the A.C.U. decided some little time ago to proceed with the organisation and carrying out of the Autumn One Day Trial, yet it is considered that the prevailing circumstances are so adverse that the cancellation of the trial is the only course open to the Union.

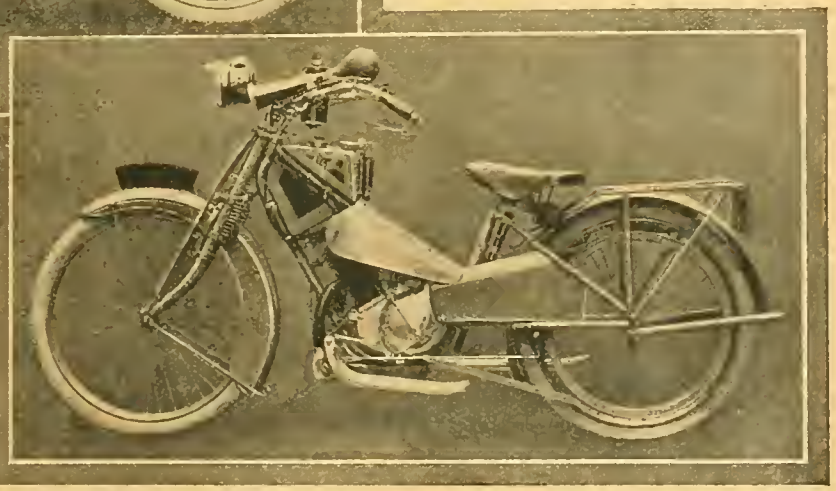


Five despatch riders attached to the Legion of Frontiersmen who left Nottingham for Paris on Wednesday morning last week. All are mounted on Rudge motor cycles. Left to right their names are Spendlove, Charlton, Aldershaw, Edwards, and Hyde.

A New Lady's Model.

THE CLYNO TWO-STROKE ADAPTED FOR LADIES' USE.



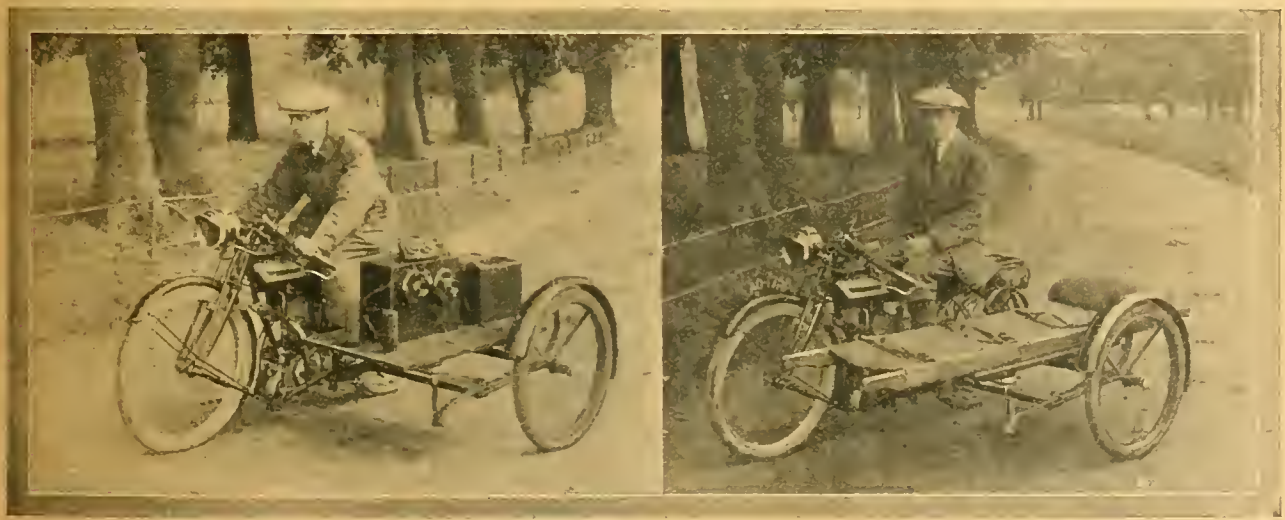


Right and left side views of the new lady's Clyno two-stroke machine

ONE of the smartest open frame models we have yet seen comes from the Clyno factory at Wolverhampton, and its graceful lines are sure to attract the attention of the weaker sex. The power unit is the combined two-stroke engine and two-speed gear exactly the same as on the standard men's model. A large plate clutch is carried inside the 6in. belt pulley and is operated by a convenient handle-bar lever. The normal engine position is retained, and this, in itself, is peculiarly adaptable to the open frame. The loop frame design is similar to the standard except that the top tubes are replaced by a double sloping tube, between which the tank is fitted, overlapping at the top so as to give a very neat appearance. The arrangements for dress guarding are excellent; the flywheel is enclosed in the usual way, and a belt guard has been added to the clutch cover. In addition to this, a neat and quickly detachable engine shield is fitted, and the rear guard is provided with a very deep valance to protect the dress from the wheel. All the controls are very conveniently arranged, and a glass sided oil pump ensures a full charge of oil reaching the petrol tank for mixing purposes. The long, curved aluminium footboards provide ample protection for the feet, and the machine is equipped with lamp, generator, horn, tools, etc.

Showing protection of the cylinder and driving belt.

THE USES OF THE MOTOR CYCLE IN WAR.



A Rover sidecar which has been converted, by removing the body and substituting a wooden platform on the chassis, into a means of carrying either field telephones or an ambulance. The work was done by E. F. Gilbanks, the motor cyclist seen in the photographs, who is captain of the Cumberland County Motor Cycle Club

600th Issue of "The Motor Cycle."

Founded on March 31st, 1903, the present is the six hundredth consecutive issue of *The Motor Cycle*.

Manxmen for the Front.

We hear that D. M. Brown, of Douglas, left for "the front" on Saturday last, taking with him a 3½ h.p. Rover, which he has used during the past season. We understand that Brown is the first Manxman to be accepted for despatch riding. He volunteered in Birmingham six weeks ago.

A Reassuring Outlook.

An article in *The Times* of Thursday last was very comforting reading. The writer pointed out that the trade of this country had not been affected by the war to anything like the extent that had been anticipated, owing to the splendid manner in which the trade routes had been kept open by our Navy. It therefore behoves all manufacturers to keep their works open so far as possible, and to see that lucrative trade, which might be obtained by this country, does not pass elsewhere.

The Fate of the Olympia Shows.

Although not primarily of such importance to motor cyclists as the motor cycle show, the fate of the great Olympia motor car show concerns every one interested in road travel, and the news of the abandonment of the 1914 show will be received with mixed feelings by the public, as it has been by those intimately connected with it in a business sense. However, the decision was arrived at on Friday last by the Council of the Society of Motor Manufacturers and Traders that no show should be held this year. This decision, of course, reflects the opinion of the majority of the council, but there are several prominent members of the motor car industry who do not view the abandonment with favour. Apart from the purely business aspect of the matter, quite a number of members felt that it would be hardly fair to our French and Belgian friends to hold the show, even if we were able to do so, at a moment when our Allies could not possibly participate in it themselves. At the moment of writing the fate of the motor cycle show hangs in the balance, but the decision of the Manufacturers' Union will be found elsewhere in this issue if received before going to press.

B8

A Military Trial Abandoned.

An open military trial was to be held by the Streatham and District M.C.C. on Saturday, but last week the arrangements were abandoned.

Petrol at 1s. a Gallon.

Why not? The possibilities of such a reduction and the good effect to the motor industry generally are discussed in our leading article this week. If the different trade societies were to take up the matter seriously there is a strong feeling that a substantial reduction could be made in the present price of motor spirit.

Preference for British Machines.

Statistics of motor cycle importations into New Zealand make interesting reading. The following figures show the number of motor cycles imported into New Zealand for the years ending March 31st, 1913 and 1914:

	1913.	1914.
British ..	2,778 ...	3,530
Other ...	303 ...	362
Unknown ...	153 ...	225
Total ...	3,234 ...	4,117

Taking the average retail value of a motor cycle at £75 the values show—1913, £242,550; and 1914, £308,775.

SPECIAL FEATURES.

CHEAP PETROL
THE MOTOR CYCLE IN WAR.
MORE NEW DESIGNS.

Auto-wheels for Invalid Chairs.

A hand-propelled invalid's chair has been seen near Woolwich with a wounded officer in charge. To aid hand propulsion an Auto-wheel was fitted to the rear driving wheel.

Indians Favour a Show.

Mr. W. H. Wells has left in the *Mauretania* for the United States, where he will finally decide on the improvements in the 1915 Indian models. Mr. Wells, it is interesting to note, is strongly in favour of holding a show.

The Motor Cyclist Special Reserve.

Two years ago a scheme was drawn up by the Technical Reserve Advisory Committee for the enlistment of motor cyclists on certain terms of service. Unfortunately recruiting was not brisk, and upon mobilisation the War Office found itself short of a good number of motor cyclists. The A.C.U. was approached, and in thirty-six hours the War Office had as many despatch riders as were needed.

During the blackberry season the sidecar combination will be much in evidence in out-of-the-way places.

Works Still Busy.

We hear that the Swiss works of the Motosacoche at Geneva are still busy in spite of the war. The English works at Willesden are, of course, open.

More First Descriptions of New Models.

This week *The Motor Cycle* is able to provide its readers with an exclusive description, accompanied by illustrations, of an entirely new Druid spring fork, also a new Clyno two-stroke lightweight specially for ladies' use.

Motor Cycles as War Booty.

In the course of their march through Belgium the Germans levied blackmail, as is well known, on various towns. Ghent, in addition to being ordered to supply a large number of cigars and barrels of petrol, had also to supply ten motor cycles. We hope they were not in perfect running order!

A Chance for Would-be Despatch Riders.

The Bristol Motor Cyclists' War Committee inform us that they are in urgent need of more good men for active service. It is interesting to hear that the last contingent included Eric Williams and his brother of Junior T.T. fame. The committee has offices open all day long at Queen's Hotel, Clifton.

A Swing Bridge Mishap.

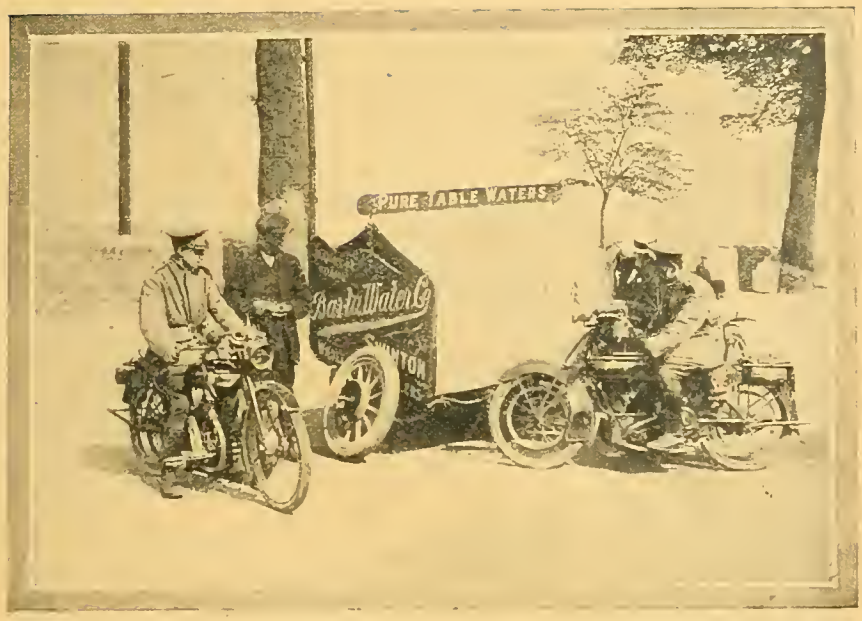
A somewhat remarkable accident occurred at Aberdeen Harbour on Sunday last. A motor cycle and sidecar, carrying three Navy men as passengers—two in the sidecar and one on the carrier—was proceeding to cross the swing bridge, the driver failing to observe that it was open to allow a vessel to pass, with the result that the party ran heavily into a concrete wall. The driver himself was unhurt, but the three passengers were all injured, and, unfortunately, one shortly afterwards died.

Plenty of Petrol About.

As showing the entire absence of any need to worry about the supply of petrol in this country or any likelihood of an advance in price in the near future, we may mention that in July last record shipments amounting to over seventeen million gallons reached our shores, and this was followed up by a further twelve and three-quarter million gallons in August. In addition to this, colossal supplies have reached France for the use of the Allies. Germany, on the other hand, is very short of petrol owing to the closing of the Danube route from Galicia, the source of her main supply, by the Servians.

A New English Magneto.

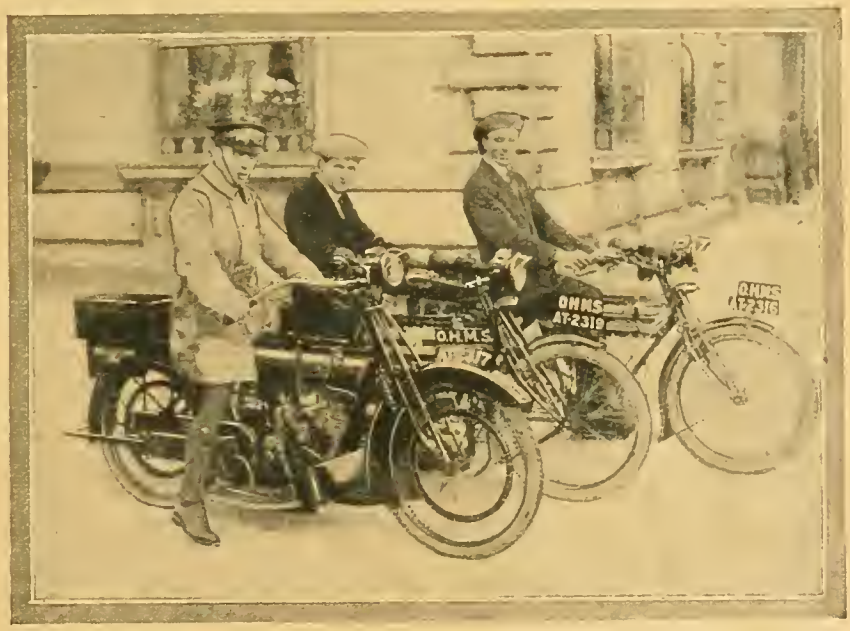
There is no doubt that electrical engineers in this country are doing their best to cope with any possible future demand for magnetos. Messrs. Morris and Lister, of Lockhurst Lane, Coventry, are at the present moment putting through a batch of magnetos suitable for single-cylinder machines. The device is designed to fit standard magneto platforms, and closely follows the general lines of the well-known Bosch instrument. The makers have already had great experience with windings similar to magneto armature windings, and repetition work in small electrical fittings.



Motor cyclist scouts assist with a lorry which had suffered a broken axle. The lorry in question was conveying supplies to the camp. The motor cycles are a Rover and Lea-Francis.

Territorial Motor Cyclists.

Within seven days of the outbreak of hostilities the Territorial units were all filled, and in addition a large number of motor cyclists were on the War Office waiting list. Also, the A.C.U. has a list of 1,500 motor cyclists indexed in the various localities in which they reside, and from which motor cyclists can be supplied as required. The Liverpool office of the A.C.U. has supplied a large number of men for the Mersey defences. Indeed, so great has been the response that it is unlikely that many of the riders who have offered their services will be required, and our readers are advised to seek other outlets for their patriotism, *e.g.*, the firing line, where it is reported that the coveys of Germans are very numerous, well grown, strong on the wing, and likely to provide excellent sport.



FIRST APPEARANCE OF THE O.H.M.S. BADGE ON HULL MOTOR CYCLES.

Three of the Royal Engineers Despatch Riders who have just been appointed and supplied with up-to-date motor cycles for Humber Defence Headquarters. The riders are W. R. Storey (Lea-Francis), E. Woodwood (Triumph), and H. Havercroft (Triumph). Another member is W. Hodgson (off duty on day of photograph), whose mount is a B.S.A.

"The Motor Cycle" Suggestion to Combine the Shows.

We observe with interest that three contemporaries this week revive the original suggestion of *The Motor Cycle* in its issue of September 3rd to combine the car and motor cycle shows this year.

B.S.A. Profits.

The directors of the Birmingham Small Arms Co., Ltd., resolved last week to recommend to the shareholders final dividends for the year ended July 31st, 1914, payable on October 5th next, as follow: On the "A" preference shares 2½%, making 5% for the year; on the "B" preference shares at the rate of 6% per annum for the half-year; on the ordinary shares 5%, together with a bonus of 1s. per share, free of income tax, making with the interim dividend a distribution equal to 15% for the year.

Vacancies for Despatch Riders.

We are informed by Lieut. H. B. C. Pollard, Inspecting Officer, London Motor Cycle Reserve Committee, that there are still vacancies for men, not limited to home defence only, as despatch riders.

Motor Cyclist as Range Finder.

The Express relates a stirring story of the earlier stages of the battle of the Aisne. A motor cyclist dashed almost within touch of the German troops in order to ascertain the accuracy of our heavy gun fire. Speeding back unscathed, he reported that some of the shells were falling some four hundred yards short. The range was then corrected with deadly effect. Later in the day the same motor cyclist had his machine literally blown to pieces from under him by the bursting of a shell; the rider was wounded, but escaped death by a miracle.

A Triumph sidecarist breasting Beacon Hill, near Rednal, in the South Birmingham M.C.C. informal trial on Saturday afternoon last. The hill was dry but the surface rough. There were only two or three failures.

Motor Cycles for the Armies.

The motor bicycle is proving its worth in the war, as everybody with a knowledge of motor cycle matters years ago predicted would be the case. British-made machines are being favoured by all the Allied Armies, and large orders were received last week from Russia, Belgium, and France, whilst the British Government has, too, recognised the valuable work of the motor cyclist despatch rider on the Continent and is placing further contracts. The result is that a number of manufacturers, whose works were on short time, suddenly find themselves extremely busy on urgent orders, and overtime is now the order. It may be added that Russia favoured P. and M. machines, Belgium ordered Enfield mounts, France has requisitioned a fleet of Triumphs, whilst the British Government has mostly purchased Triumph, Douglas, and Rudge machines. Practically every well-known make of motor cycle is in use on the Continent.

Sidecar Samaritans.

The Rev. P. W. Bischoff writes to us with reference to our leaderette last week under the above title. He says that, as far as Bristol is concerned, and probably with regard to all centres where the wounded are being nursed, sidecar owners should not write individually to the hospital authorities, who have an immense burden of correspondence to bear. Riders should organise themselves under one man who alone should approach the authorities. This greatly simplifies matters. It must be remembered that soldiers in hospital are under full military discipline, and can only be allowed out after certain definite formalities have been carried out. In Bristol, this side of the nursing arrangements was placed, some time ago, in the hands of the Bristol Motor Cyclists' War Committee, Queen's Hotel, Clifton, of which Mr. Bischoff is honorary secretary. They will be pleased to accept offers of sidecar drivers for this benevolent work. It is worth noting that all such Samaritans in any part of the country should equip their sidecars with a good warm rug, and also with a small firm cushion, in case any damaged limb needs support during the run.

Quick Delivery.

We learn from Messrs. Douglas Bros. that on Saturday last they received an order from the War Office for ninety Douglas motor cycles, and that the whole of these were duly delivered by the following evening, Sunday, September 20th.

Machines for War Use.

We have received a letter from the 25th County of London Cyclists' Battalion, Fulham House, Putney Bridge, S.W., which reads as follows: "I beg to announce that the makes of machines accepted by the War Office have been limited to the following: DOUGLAS, TRIUMPH, P. and M., RUDGE, ROVER, B.S.A., and JAMES (single-cylinder).—Hugh B. C. Pollard, Inspecting Officer, London Motor Cyclists' Reserve Committee."

Germany's Tyre Trade.

In 1912 the Board of Trade announce that Germany exported motor car and motor cycle covers and tubes of a gross value of £1,731,600. Of this total, France was the largest customer with £422,300. England comes next with £298,400. Australia is another important market for this class of goods, which our own manufacturers should secure in future, as is also the Argentine Republic. The total value of covers and tubes exported from Great Britain in 1913 amounted to £749,300, but this figure does not include tyres fitted to exported cars and motor cycles. Austria's export trade in tyres is insignificant, amounting in 1913 to only £47,600.

Motor Cyclist Competition Riders at the Front.

Many readers will learn with interest that S. A. Rowlandson and W. L. T. Rhys (the Rudge riders), D. H. Noble and C. T. Newsome (the Rover riders), and Emery (the old Norton rider), are in the 69th Company Motor Transport Section, Army Service Corps. They sailed on Sunday last from Avonmouth for an unknown destination at the front, where their lorries will carry the food supplies of the Indian Army. Newsome is a lance corporal and Emery a sergeant.

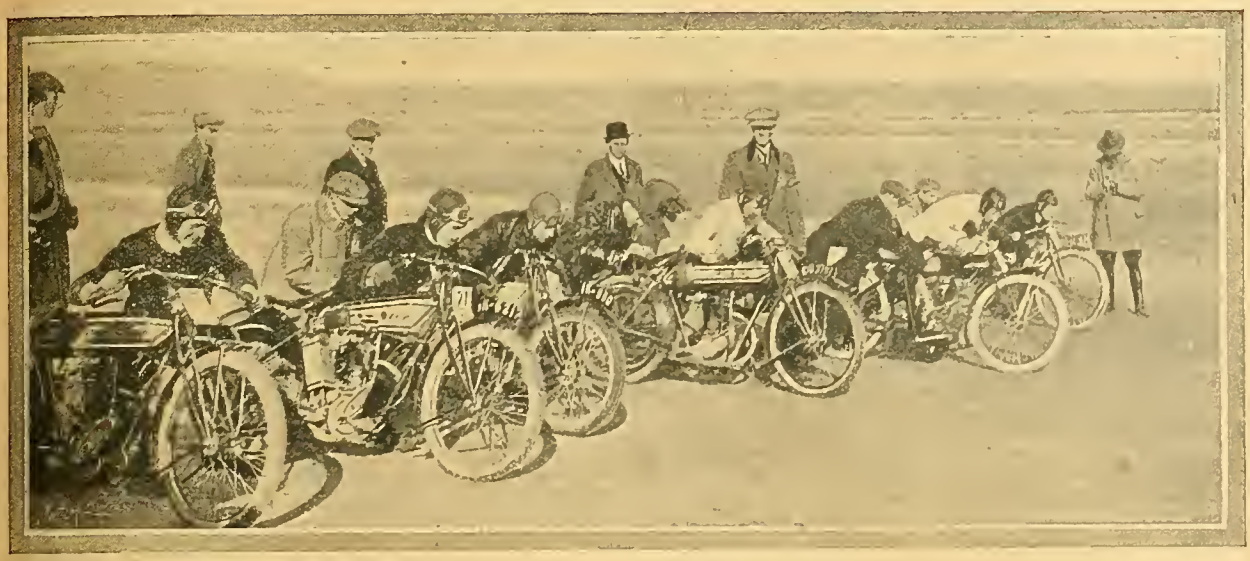
Norman Lea (of Lea and Francis, Ltd.) has been accepted for service in the Motor Transport Section.

THE SHOW ABANDONED.

At a meeting of the Cycle and Motor Cycle Manufacturers' and Traders' Union, held on Tuesday afternoon last, it was resolved, owing to Olympia being taken for purposes of war, not to hold a Show this year.

The suggestion of "The Motor Cycle" in the issue of September 3rd, to hold a combined Car and Motor Cycle Show was considered, but having regard to the fact that the S.M.M.T. had already decided that it would not hold a show for cars this year, the scheme could not be pursued.

RACING AT PORTMARNOCK.



Start of the scratch race on Portmarnock Beach last Saturday.

THE last meeting at Portmarnock for 1914 was held on Saturday afternoon under the auspices of the Dublin and District M.C.C. Granting that there were exceptional circumstances that interfered with the success of Saturday's racing, it must be confessed there has of late been a distinct falling away of interest in racing on the sands, and the entries have been much smaller than those received for competitions on the road. It is felt that the game is becoming too highly specialised, and, apparently, the average motor cyclist thinks it hardly worth while to devote the time and attention to the tuning up of his mount that is called for to ensure success. The lightweight race on Saturday did not fill, and for the two open events the entries were on the small side. The scratch race resulted in a very easy win for C. B. Franklin on a 3½ h.p. Indian, as, indeed, many scratch races at Portmarnock do, and in the fifty miles handicap J. Healy followed up his win in the one hundred miles event at the last meeting by an equally easy victory, winning by about three miles. Results:

SIX MILES OPEN SCRATCH RACE.—Under 500 c.c.

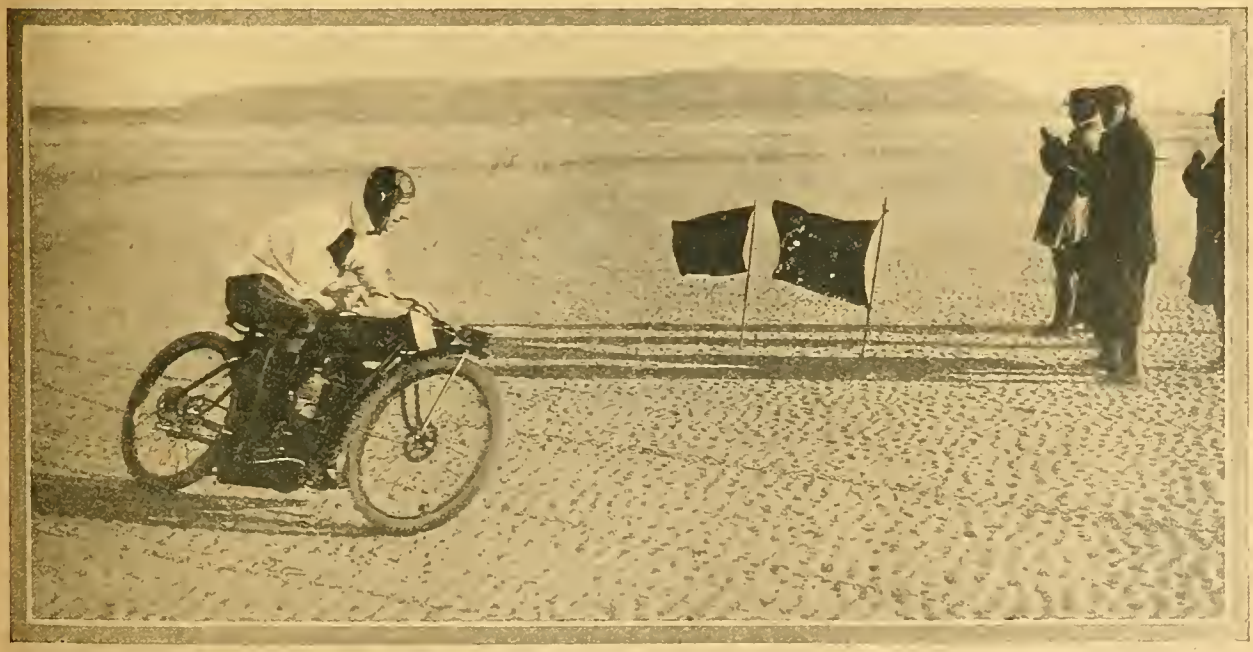
1. C. B. Franklin (3½ h.p. Indian).
2. F. Holmes (3½ h.p. Rudge).
3. T. E. Greene (3½ h.p. Rudge).

Won by twenty-four seconds; four seconds between second and third. Winner's time, 7m. 10s.

FIFTY MILES OPEN HANDICAP RACE.—Unlimited c.c.

	Start.
1. J. Healy (3 h.p. Enfield)	12m. 30s.
2. F. Holmes (3½ h.p. Rudge)	2m. 0s.
3. R. White (3½ h.p. Rudge)	8m. 0s.

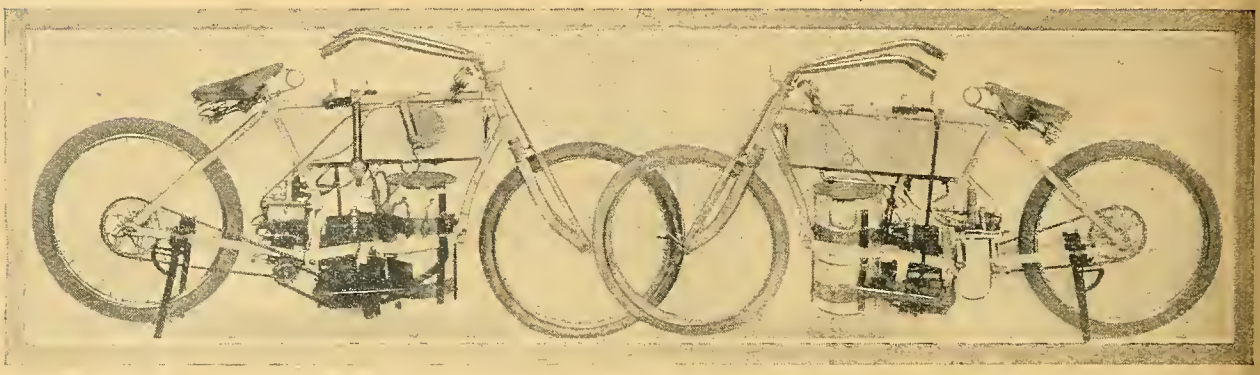
Won by three miles; a poor third. Winner's time, 1h. 12m. 25s.



C. B. Franklin at the turn. This Indian rider has scored many successes since the inauguration of motor cycle racing at Portmarnock.

ANOTHER STEAM MOTOR BICYCLE.

A Twin-cylinder Machine, the Result of Six Years' Experimental Work.



The Field steam motor cycle, showing the disposition of engine, generator, and water pump.

FLEXIBILITY is a point which is aimed at by all motor cycle designers, and is a much more difficult problem to deal with when internal combustion engines are the power units employed. By adopting a steam engine it is possible to utilise a better system from whence flexibility can be obtained. There are, of course, many difficulties which arise when such a source of power is applied to the motor cycle, as trouble is experienced in cutting down the overall dimensions and weight to really practical limits. At the same time, Mr. Field, of 101, Rosemary Road, Clacton-on-Sea, has succeeded after six years' experimental work in building a steam motor cycle of a thoroughly practical nature. His experience has led him to adopt a two-cylinder single-acting variable expansion high pressure engine. The bore and stroke are 45 mm. × 50 mm., and the cylinders are fitted with mushroom valves of special steel. The pistons are practically the same as those generally used in petrol motors, and are fitted with three rings. The crankshaft is so designed that the crank pins are opposed—that is, at 180°—and the big end bearings of the connecting rods are split and are also similar to the usual type which are used in petrol engines. There are only two timing wheels in all, one being on the camshaft and the other on the crankshaft. The valves themselves are placed on one side, and are operated by ordinary tappets. It is possible to vary the lift of the valves by moving the cams, and if necessary the whole of the movement imparted to the valves can be eliminated. The action corresponds to the valve system employed on the motor cycle engine. A steam generator of the instantaneous flash type is fitted, and is supplied with a feed water heater, the whole concern being housed in an asbestos-lined steel case which also contains the burner. This, it will be noticed on referring to the illustration, is placed in front of the engine.

Absence of Controls.

There are no hand pumps other than the ordinary pump used for lubrication, which is identical with that on a petrol-engined machine. The fuel supply is entirely automatic, and is carried out in the following way. There are two fuel tanks, one of which contains a small amount of fuel at a pressure of from about thirty-five to forty pounds to the square inch. By means of this the fuel is conducted to the burners, and as it becomes used up means are provided by which a similar amount is supplied automatically. By such a system it is possible to fill up the main fuel tank whilst the engine is running. The water pump is housed behind the engine and takes up very little room. It is possible with such an engine to utilise a very high gear, consequently the gear ratio is in the neighbourhood of 2½ to 1. Even with a ratio such as is employed the machine can be started on the stiffest of gradients. Chain transmission is fitted from the engine to the countershaft, which is utilised for driving the pump mechanism as well as for conveying power to the rear wheel by means of a chain. The design of the machine generally is well carried out, and the designer has made a special point of getting the centre of gravity as low as practicable.

Power and Simplicity.

The engine is capable of developing from 6 to 8 h.p. owing to the high pressure of steam that can be used. It will, therefore, be seen that a motor cycle on these lines should be excellent for sidecar purposes. The total weight is 160 lb., and this, of course, compares favourably with petrol machines of similar horse-power. The machine is started up in the following way: a small quantity of methylated spirit is poured into the burner channel, and allowed to burn for three or four minutes. When sufficient heat has been imparted to the burners the water and fuel regulators are opened, and by walking the machine for three yards starting can be effected. The control is on the burner and generator, and if an instantaneous stop is necessary the cutting off lever on the side of the tank puts out of action a cam and so stops the valves from opening.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost" and "Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and all that are notified to us are inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.

The Motor Cycle in War.

Instructive Military Experiences with Different Machines at the Front.

By VERNON BUSBY, CORPORAL, ROYAL ENGINEERS.

AS the motor cycle is playing such an important part at the front at the present time, a few words as to my experiences with about fifteen machines attached to the 2nd Army Headquarters, for the satisfactory running and keeping in order of which I was responsible, might not be out of place. I was only privileged for a short time to be with them, viz., about three weeks, before being wounded, but I may truthfully say my observations taught me a good deal even in this time.

To start with, the motor cycle sections were so quickly organised and formed that I regret to say they did not always contain the men best fitted for the work, although several most useful people have gone, whose combined experiences, both military and motor cycle, are excellent. There are still several, I believe, who were disappointed in the tremendous rush, but it is to be hoped their services will be eventually requisitioned. I refer particularly to Public School and University men who have served in their Officers' Training Corps, and have good and practical motor cycling experience, but, in my estimation, long motor cycling experience is of more value than military, although it is desirable to have plenty of both. I am also of the opinion than a man should be taken on wherever possible with his *own* machine in preference to being provided with a Government mount, which will most likely be strange to him, and a machine has to pay very heavily for its rider's lack of knowledge of it, as a good number of those I saw were having a terrible time.

What the Machines have to Stand.

The machines in my section were for the most part three-speed Triumphs, the remainder consisting of a Douglas and a Rover and my own T.T. Sunbeam, which, by the way, was still doing good work in the hands of another rider when I left. I will not attempt to criticise these machines, as many would think my opinion biassed, and, again, their total mileage was nothing very extraordinary. If I may be allowed to suggest what long experience has taught me to be the most practical form of machine for the purpose, I say without the slightest doubt that it requires an absolutely special model. I might mention here that the majority of machines, especially the Government ones, were suffering from the riders' lust for speed, and were being pulled into all sorts of queer shapes, handle-bars, footrests, etc., some, but not all, at the rider's will, others by numerous falls, as most of our gallant recruits thought it necessary to indulge in the highest possible speed where the road was not crowded with troops.

The Type of Machine Required.

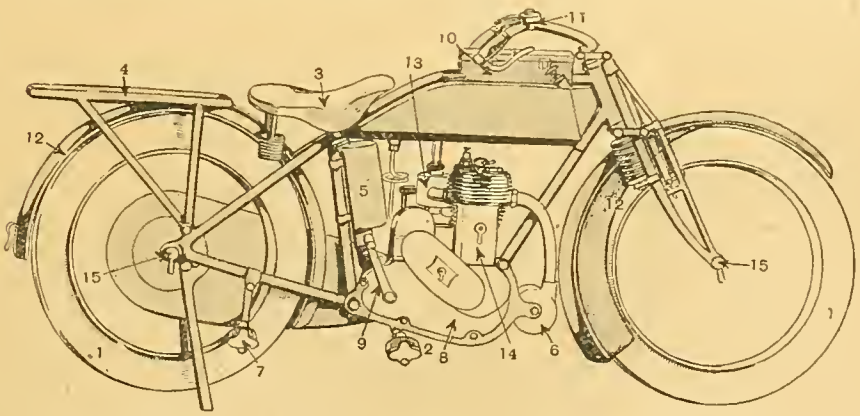
It is a most mistaken idea to think that the 60 m.p.h. racing machine stripped as much as possible is the one for the purpose, although I agree a modified T.T. mount conforms somewhat to my ideals, as far as speed is concerned. I consider 40 to 45 m.p.h. all that is necessary, and maintain that a 500 to 600 c.c. engine so constructed will give a higher and much more reliable average speed over, say, 2,000 to 3,000 miles than the faster engine is likely to do. It should be constructed in the simplest possible way, accessibility should be studied to a fine point, and it should be possible to be dismantled quickly with the simplest tools by any ordinary man of a mechanical turn of mind. The valves, and, if possible, the magneto timing should be simply marked.

The frame is a most important matter, as it is necessary to carry the kit on the carrier, and this being bulky and somewhat heavy naturally upsets the steering considerably. Again, the motor cycle proved itself very useful at Mons, by taking officers on the carrier who had lost their horses, and served no end of other useful purposes, while it is easily possible to bring along wounded men (suffering from arm and leg wounds) in the same manner. Consequently, one may have to depend upon putting considerable weight on the carrier, and I think it very advisable to fix the saddle position further forward than on standard machines; there is also room for ingenuity in discovering how best to pack away one's kit conveniently, as the carrier position is rather high. The frame should be rather stronger than usual, and designed neatly to take a two-gallon tank and half-gallon spare tank. The fork springs should be rather stiff, and incapable of breakage.

The practice of small brazed lugs instead of clips, which is now almost universal, is to be highly recommended.

Gear and Transmission.

Although, perhaps, one may think that I may be biassed, I assure the reader I have an intimate experience of all the well-known machines on the market, and can promise him I have found nothing better than the enclosed chain and spring drive transmission. The chains of my own machine have only been adjusted once in ten thousand miles and appear almost as good as when new. The majority of enclosed chain drives give most excellent results, and I personally consider them all superior for war purpose to either belt or chain-cum-belt drives, although very good results are obtained from both these systems.



SKETCH OF MILITARY MOTOR CYCLE SUGGESTED IN VERNON BUSBY'S ARTICLE.

1. 3in. tyres
2. Big ground clearance.
3. Saddle far forward.
4. Extra large flat top carrier.
5. Spare petrol tank.
6. Large silencer.
7. Footrests for pillion rider.
8. Engine and two-speed gear unit
9. Kick starter
10. Tool box on top tube.
11. Handle-bar control for plate clutch.
12. Large guards with big clearance.
13. Exhaust heated carburetter.
14. Enclosed valve gear.
15. Detachable wheel.

A SCENE IN CAMP.

Motor cyclist despatch riders attached to the Leicestershire Yeomanry at Diss (Norfolk). B.S.A., Campion, Douglas, Matchless and Humber motor cycles are used.

Two or Three Speeds?

As far as the gear is concerned, I think a two-speed counter-shaft gear box with sliding dog clutches the most suitable by reason of its light weight and the fact that it is more likely to stand rough handling, and, although, of course, a three-speed gear possesses advantages, I do not think the extra weight and complication are worth while if a low top gear is fitted, and a good reliable (plate) clutch that will stand almost continuous slipping. Finally a neat and reliable kick starter is a great asset.

I can think of nothing better than the detachable wheels now on the market, and consider them splendid fitments. The spokes should be of stronger gauge than standard, and as to tyres and rims, I strongly recommend a three-inch tyre for the tremendously hard work called for. It should not be necessary to touch the brakes to take out either wheel. They should be efficient, simple, and should possess large braking surface. I am not in favour of wires for working them if these can be avoided, as they are hard to replace in case of breakage. An efficient silencer which is well clear of the ground, and a quiet and protected valve gear are desirable.

The Country Traversed.

Some may think my points far fetched, but I can assure them that to be of any real use the machine must be carefully and thoughtfully designed for the extraordinary conditions it has to encounter. The motor cycle is quite capable of doing the most wonderful work, even though it has to be driven perhaps by several different drivers in a reckless manner, and over terrible surfaces, when every minute counts. We ourselves in one instance drove across ploughed fields, when our machines dropped in the mud up to their axles with the wheels still revolving, and yet the machines stood it, although they would have done much better had they been fitted differently; while upon two separate occasions they were left to the full blast of a thunderstorm all night long.

Points to be Observed.

Summing things up, the essential points are:

High ground clearance.

Ability to resist all weather conditions.

Absolute reliability, and ability to cover the longest distances with the minimum attention possible; consequently the ultra-efficient engine is unsuited.

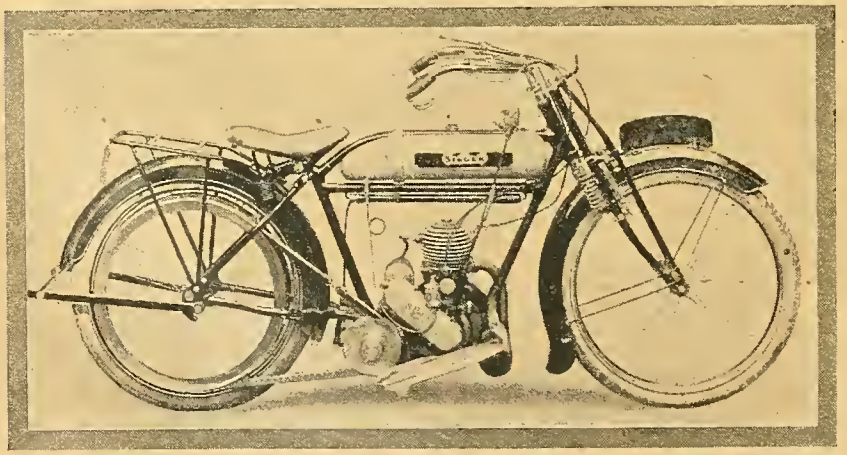
Simplicity of construction and control.

Perfect standardisation and standard threads.

Some Suggestions.

An excellent thing would be to be able to change complete power units, including gear box, in a few minutes, as should a machine have to be abandoned very often room may be found on a lorry for the unit, whereas the machine may be too bulky, and also, in case of damage to frame, etc., it would be easier to fit a new unit quickly. Bowden wiring, simple and easily detachable with interchangeable cables; low compression; carburetter to be kept as warm as possible, so as to be able to run on the crudest fuels; large petrol filter, and the filler caps *non*-detachable; nail-catchers fitted; good clearance mudguards and strong *stays;* small undershield protector; proper fittings for carrying spare tyres and tubes; tool-bag on top tube, and map case fitted on top of that—are all important details, and an all-black machine is essential. Before going to the front, we had to black all the bright parts to minimise the risk of detection by searchlights.

In conclusion, I may say that it is most desirable that the machine should be of a slow and sure type, as absolute reliability is essential, but high speed is not so necessary



ANOTHER ADDITION TO THE LONG LIST OF TWO-STROKE MACHINES.
Belt side of the 2¾ h.p. Singer, showing position of carburetter, footboards, and lubrication.
A description, with illustrations, appeared in last week's issue of this journal, page 350.

STANDARD

BELT FASTENERS.

THERE'S nothing "just as good" as a "Standard" whatever price you pay. The Fastener made by the Belt Fastener Specialists is the only one for you if you want a really dependable and serviceable connection. The only fastener guaranteed for ever without reservation. You simply can't put a "Standard" out of action. Costs only 10d., and with the three "S" Hook adjustable feature at 3d. extra you can shorten or lengthen your belt in a few seconds. Made in all sizes, and a special type for Dunlop round top belting. If you require a cheaper fastener the "SIMPLEX" at 6d. and 9d. will meet you — nothing better at the price that will really do the work.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

R.A.C. Horse Power Formula.

Can you tell me how the R.A.C. rating of an engine is obtained? Is the power of a motor cycle engine found in the same way as that of a car engine?—F.D.S.

The R.A.C. formula is not much use for motor cycle engines. It is the same formula for both motor cycles and cars, and is as follows:

$$\frac{D^2 \times N}{2.5} \text{ or } \frac{D^2 \times N}{1613}$$

D^2 = diameter of cylinder squared.
N = number of cylinders.
2.5 = constant when diameter is in inches.
1613 = constant when diameter is in millimetres.

Sidmouth to Northwood.

Can you give me assistance in planning out the best route from Sidmouth (Devon) to Northwood (Middlesex), and from Northwood to New Cross and Clapham Common, from which point I wish to return to Sidmouth?—J.L.

From Sidmouth, go through Honiton, Chard, Crewkerne, Yeovil, Shaftesbury, Wilton, Salisbury, Andover, Whitchurch, Basingstoke, Bagshot, Staines. After crossing the river, go straight on through Colnbrook, follow the signposts to West Drayton and Uxbridge, and at the latter place ask your way to Northwood, which is comparatively easily found. For the route from Northwood to New Cross and Clapham Common, see the R.A.C. Official Map of Recommended Routes Around London, obtainable from these offices, price 1s. 8d. post free. From Northwood to New Cross is a tiresome journey, but as there is not very much traffic in London at the present time it should not be so difficult as ordinarily. The best way to proceed would be to get into London through Pinner, Wembley, Willesden, Harrow Road, Edgware Road, Park Lane, Grosvenor Place, Vauxhall Bridge Road, Kennington Oval, Camberwell New Road, New Cross. To return, your best way would be to go down New Cross Road, Camberwell Green, Acre Lane, Clapham Common, Wandsworth, Upper Richmond Road, Mortlake, Richmond, Twickenham, Sunbury, Staines, and back to Sidmouth by the route previously given through Basingstoke and Salisbury.

Condensation on Inlet Pipe.

I have a $2\frac{3}{4}$ h.p. motor cycle of this year's make. I find that there is always a damp deposit on the top of the induction pipe where it joins the carburetter when the machine is running. I suspected a leak at first, and had a new washer fixed between carburetter and induction pipe, but with no result. What do you think is the cause of the dampness?—J.B.

The trouble of which you complain is due to condensation through the extreme cold of the inlet pipe, caused by the vaporisation of the petrol. It may be cured by taking steps to see that the carburetter is adequately warmed, either by the exhaust or by fitting a funnel through the intake close up against the cylinder. If this is done a marked improvement in the running will be the result. Such a funnel can probably be obtained from the manufacturers of the machine.

A Question of Balance.

With my engine ($3\frac{1}{2}$ h.p.) warm, plug, etc., removed to relieve compression, and the belt removed, I find that if I place the piston on the firing stroke it will fall to the bottom of the stroke. Does not this point to the piston being too heavy? Would you advise a little drilling to make lighter, or increase the counter-balance? If the latter, how? I mention the firing stroke to show there can be no question of valve spring pressure. Would too heavy a piston cause early knocking on hills, as the compression and bearings are excellent?—BALANCE.

You cannot judge your balance by the method indicated, and if the engine is sufficiently free the piston should drop to the bottom of the stroke, as the total weight of the reciprocating parts is never completely balanced. As a general rule, in single-cylinder engines the rotating parts and half the reciprocating parts are balanced. This would leave at least half the weight of the piston to cause it to drop to the bottom. A heavy piston is not likely to be responsible for the knocking on hills, unless the weight is very much in excess of what it should be. From what you tell us, we should imagine the compression is slightly too high. A thin plate under the cylinder would probably cure this. Try benzole to cure the knocking.

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints, half-plate, 1/6 post free; mounted, 1/9 post free. This refers to photographs taken by "THE MOTOR CYCLE" operators.

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

Valve System Conversion.

Is it possible to convert automatic inlet valves, as fitted to a Peugeot engine, into mechanical valves? If so, what is the best procedure, and the approximate cost?—N.E.

We should not think it would be at all advisable to convert the automatic inlet valve on your machine to a mechanical one. The difficulty would be in designing the new timing gear, which would be an expensive matter, and, in our opinion, not worth while carrying out. We imagine from your remarks that you are not satisfied with the automatic valve. As a matter of fact, excellent results can be obtained from this type of valve with a little experiment with valve springs. See hints in "Motor Cycles and How to Manage Them."

Machine Runs Too Fast.

I have a $3\frac{1}{2}$ h.p. horizontally opposed twin with Amac carburetter, and 26 jet. I should be glad if you will kindly tell me by what methods I can reduce the speed of the machine? It is a new machine, and runs too fast for me, for on a little more than a quarter throttle the speed is 30 to 35 m.p.h. Would the 24 jet slow the machine and fire and start correctly, and would a decompressor give slower running?—T.P.

You could reduce the speed of the engine quite well by using a smaller jet. This will also allow you to lower your petrol consumption considerably. Starting should not be affected. We do not think it will be necessary for you to fit a decompressor for slow running, as in the majority of cases, especially where mixture is allowed to escape into the atmosphere, the fuel consumption is raised unnecessarily. It should be easy to be able to throttle down a twin of this type to run slowly, as the engine balance is almost perfect.

Difficulty in Starting.

Can you tell me why the following symptoms invariably occur when starting up my motor cycle, which is fitted with a kick starter on the counter-shaft gear? Whenever I start the machine it always seems to fire back with such violence that the kick starter flings my foot off it, and sometimes strikes me on the leg. The lever flies back with tremendous force. I invariably inject a small amount of petrol, and open the throttle about one-third. Sometimes I use a decompressor. Also, can you tell me why, when starting, one loud explosion frequently occurs?—F.M.B.

From what you say we should imagine that the trouble is simply due to the ignition being advanced too far. Try starting with the spark more retarded, and if this proves difficult check the ignition timing to see that it is correct. It should be adjusted so that the points of the magneto are just breaking when the piston has reached the top of the stroke and the spark is retarded. The explosion you speak of at starting is probably caused by an unexploded charge being drawn into the silencer and fired by the next exploded charge.

Rain on Goggles and Glasses.

I have lately taken to a motor cycle in my calling as a commercial traveller, but, owing to the fact that I have to wear glasses, have been greatly worried by the rain settling on them and confusing my outlook. As winter comes on this will be worse, but I have heard that there is a material with which you can polish the lenses so that rain will not lodge on them. Can you let me know what this material is and where it can be purchased?—K.S.

We can fully sympathise with you in this difficulty, as we know it can be very troublesome. At places like Dunhill's and Gamage's you can buy a pencil to rub over the glasses, or a simple plan is to rub the finger over the glasses as soon as they get wet. This will prevent any drops forming and enable you to see much better. Another alternative is to wear goggles and to do the same thing with these. There is a preparation known as Glasso which is also effective up to a certain point, but, broadly speaking, it is always difficult to ride in heavy rain when wearing glasses. A very little thin vaseline rubbed over the glasses is also said to have a beneficial effect.

Increasing Cylinder Bore.

I am writing to ask if you would give me advice regarding the renewal of a cylinder. I have an 87 × 87 mm. single-cylinder machine, the cylinder of which was some time ago bored to 89 mm. It is now showing wear and need for reboring or renewal. I think it would hardly stand the former, but what I want to know is this. Would an 89 × 89 mm. cylinder be suitable, or would the extra 2 mm. clearance at piston head give too low a compression? My 87×87 mm. had a too high compression and knocked on hills, but after turning some of the metal off the underside of the exhaust valve cap I obtained a good flexible engine with apparently no loss of power.—A.E.N. (Durban, Natal).

We should not advise reboring the cylinder a second time In all probability the 89×89 mm. cylinder would be quite satisfactory because the compression would be somewhat lower, but probably you would have an increase in petrol consumption. If compression were found to be too low you could probably fix a plate on your valve caps or obtain new and deeper caps. This is better than putting a plate on the piston head. If you attempt to fix these plates on the valve caps make sure that the valve head does not throw up to a sufficient degree to foul the caps. We should be inclined to advise you to consult the makers before carrying out the experiment.

To Cure Sluggish Running.

I have an 8 h.p. twin with sidecar to which I have fitted a Roc two-speed gear. The machine has been running splendidly for a long time, but now it seems to me to lose power on approaching hills, and when running on the level road it does not pull as it ought to, but the engine races a lot. Could you give me advice as to what ought to be done to remedy it? Both low and high gear seem to be all tight and firm, and the gears change properly.—W.S.C.

The trouble seems to be in the engine requiring a general overhaul. After running for some time the valves require grinding in, the strength of the valve springs requires testing, and if they appear to have become weak, stronger springs should be fitted. The carburettor should be taken down and cleaned, and particular care should be taken to have the inlet joints perfectly airtight. Also it is quite probable that the pistons are badly carbonised and require cleaning. Get a competent man to do it, if you do not care to do the work yourself, and when cleaning the pistons see that the rings have no carbon behind them, and that they are a good fit.

EXPERIENCES WANTED.

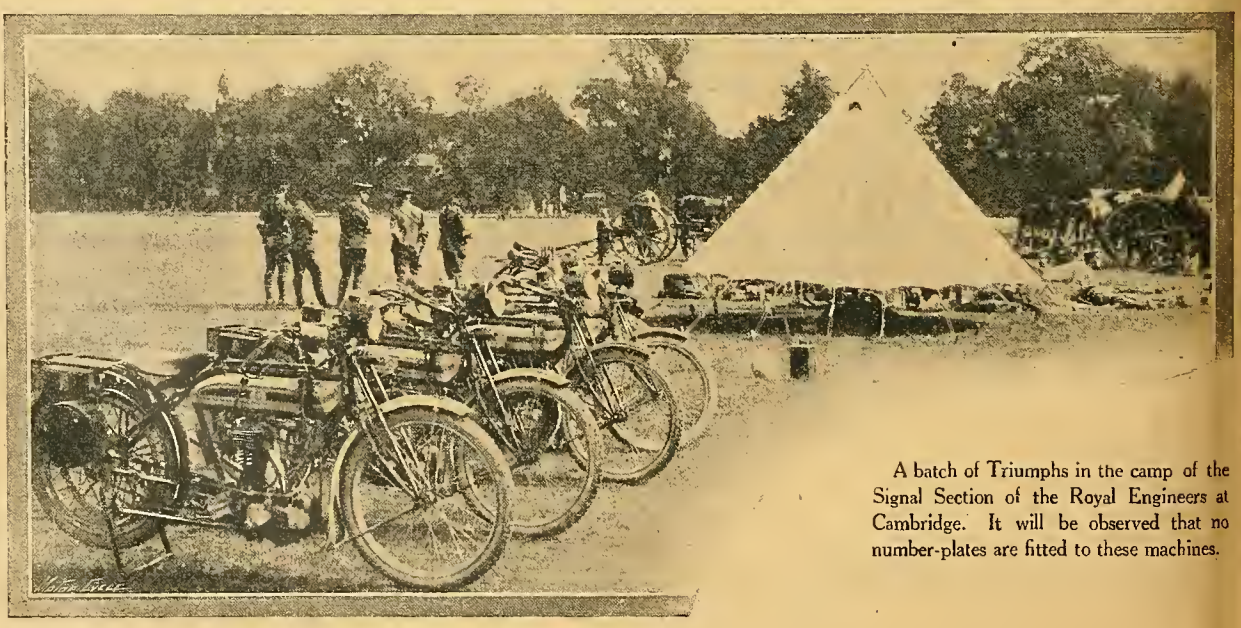
"T.W." (Bristol).—Efficiency of dissolved acetylene and dynamo lighting.

"P.N.S." (Broadway). — Reliability petrol, and oil consumption of 3½ Douglas Model B.

"A.G." (Cornwall). — 3½ h.p. twin James. Efficiency, consumption, average speed, and hill-climbing powers.

"G.H." (Southampton). — 2¾ h.p. A.J.S. and 2½ h.p. Calcott. Speed durability, and general behaviour.

"A.L.L." (Broseley).—Reliability and efficiency of Binks three-jet carburettor and the Wilkinson twelve-jet on a 3½ h.p. twin-cylinder engine.



A batch of Triumphs in the camp of the Signal Section of the Royal Engineers at Cambridge. It will be observed that no number-plates are fitted to these machines.

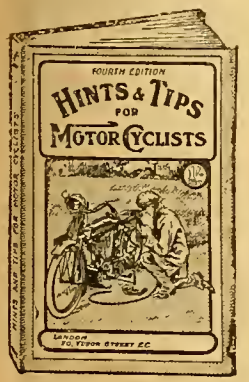
And from all Booksellers & Bookstalls. (Remittance should accompany orders sent by post)



A Useful Little Pocket Companion.

¶ Every motor cyclist should make use of this book It is brimful of sound advice respecting the care, management, and repair of motor cycles. Every hint and tip is numbered, and reference is made very simple by a very exhaustive alphabetical index.

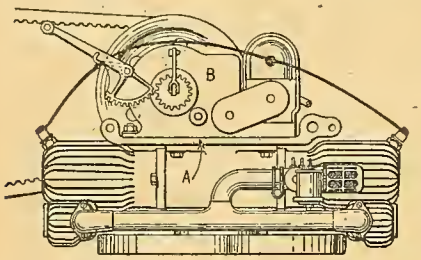
Fourth Edition, Revised and Enlarged.

Obtainable from—
ILIFFE & SONS LTD., 20, Tudor Street, London, E.C.,
and all Booksellers and Bookstalls.

Price 1/- net.
By post 1/2.

A Horizontal Engine.

This engine has twin horizontal cylinders arranged beneath a platform A, above which is mounted the gear box B and the magneto. The whole power unit is therefore attached to the platform A, and can be bodily fitted to the frame. The crankshaft is vertical, the flywheel lying beneath the cylinders, whilst the



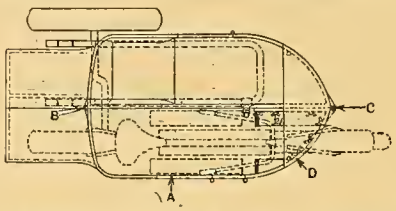
crankshaft projects upwards into the gear box, driving the horizontal gearshaft through a worm gear.—G. F. Rayner, No. 1,404, 1913.

A Novel Sidecar.

In this arrangement the sidecar body has attached to it a shield which embraces the centre of the motor cycle, and is shaped to conform with the sidecar body. The appearance obtained is, therefore, that of a wide sidecar body with two seats. The body is spring-suspended from the sidecar frame, and the shield A, which embraces the motor cycle, is

PATENTS by Eric W. Walford

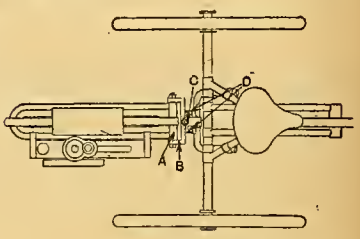
attached at B and C by hinges, the pins of which can be easily removed so as to provide access to the machine. The front portion D of the shield is separately



detachable, and a side door is provided to allow the rider free access to his seat. —N. Daniel, No. 12,221, 1913.

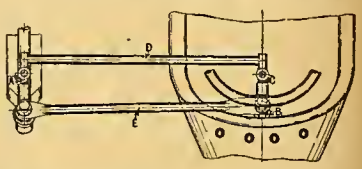
Auto-wheel Attachment.

For the attachment of an auto-wheel to the rear axle of a tricycle it is provided with a horizontal pivot pin A, carried by a fork B, which can swivel about the vertical pin C. It is important that the auto-wheel should always tend to come into a straight line immediately after turning, and to induce this, spiral springs are arranged at D and stops are provided to prevent the auto-wheel swivelling too much.—F. Hucklebridge, No. 29,345, 1913.



Sidecar Steering.

To enable a motor bicycle to be steered from the sidecar, the steering stem has attached to it an adjustable arm A, and a socket B is fixed to the front of the sidecar to accommodate the handle-bar. This is provided with an adjustable arm C, and the two arms are connected



together by a link D. A stiffening stay E is used to connect together the two steering heads. In this way a substantial steering gear is provided on the sidecar. —G. R. James, No. 9,827, 1913.

COMMENTS

Troops Billeted in Factory.

We hear from Mr. Norman Barrett that the U and I sidecar factory, King's Road, St. Albans, is being used for drilling troops, and that three hundred men are billeted in the factory itself. However, a certain portion of the factory is being kept open for repairs and for carrying on export business on hand.

Name for New Chemico Oil.

We hear from the County Chemical Co., Ltd., Bradford Street, Birmingham, that the competition which they inaugurated to find a suitable name for the new Chemico motor cycle oil has resulted in the first prize of ten pounds being awarded to Mr. F. Stafford, George Road, Erdington, who suggested the name "Coolie," and in future this lubricant will be known as "Coolie" motor cycle oil.

British Tyres for War.

Motor cyclists employed in military service should, of course, pay the greatest attention to tyres, and take care to utilise only those which are made by well-established British firms. The Avon Indiarubber Co., Ltd., is specialising in a cover of very sound construction suitable for motor cycles up to 8 h.p. This is known as the Sunstone tyre, and the tread is so constructed as to be favourable for all types of road surface. We should also like to mention that this firm employ over 1,000 hands, and they are doing their utmost to keep on their men during the present crisis. They also state that there is no need to fear shortage of materials used in making the tyres, and their deliveries in England are not affected in any way.

British Company's Generosity.

Over £350 per week is being paid by the British Petroleum Co., Ltd., to their employees who have joined the forces. These number two hundred and twenty men, and their places are being kept open for them till the end of the war. This is practical patriotism worthy of much praise.

Enfields for the Front.

The Belgian Government has just placed an order for fifty 3 h.p. Royal Enfield motor cycles, and the machines were despatched to the front at once. We believe that this is the first Government order in this country for V twin machines, and from what we know of the Enfield, from personal experience, we should say that the Belgian Government will have no reason to regret their choice.

Famous Chain Maker's Advice.

Mr. Hans Renold, addressing his workpeople and office staff the other day, said that there were two ways in which a man could be of service, one was to shoulder a rifle and take his place in the ranks, and the other was to keep the business of the country going and thus contribute to the support, not only of those who were fighting, but also of their dependents who were left behind. He urged every young man without ties and family responsibilities to volunteer immediately.

An All-British Tyre.

Messrs. Oylers, Ltd., are the manufacturers of the British-made Skew all-rubber non-skid tyre, the tread of which consists of staggered indentations on its outer edge, and also of the Skew square tread tyre, the pattern of which is more or less standard.

A Big Order.

Some idea as to the extensive use which is being made of the motor cycle in the present crisis may be gleaned from the fact that Messrs. Herwin, Canny and Co., of William Street, Woolwich, have just despatched 5,000 of their Simplex Improved belt fasteners to our army in France.

Tyres for Auto-wheels.

We hear from the Palmer Tyre Co., Ltd., that, although very busy with Government business, they are in a position to deal with all orders that may be received, whether cycle, motor cycle, light car, motor car, or their latest production—a new special tyre particularly adaptable for the Wall Auto-wheel.

A Comprehensive List.

A remarkable price list has been issued by The Service Co., Ltd., High Holborn, W.C. It is a complete guide to every possible thing any motor cyclist, or even motorist, can require. The whole catalogue, which consists of over 300 pages, is admirably got up and profusely illustrated, and our advice to all motor cyclists and cycle car users is to get a copy at once, and then to avail themselves of the many excellent bargains contained therein. For overseas riders we can imagine nothing more useful.

All-British !

Duty and satisfaction coincide when you buy Wood-Milne Motor Cycle Tyres—duty in your support of British-made goods, satisfaction in having the strongest, fastest, and safest tyres in the market.

"Over 6,000 miles on back wheel," writes Mr. C. H. Watkins, Cardiff. "and the Wood-Milne Tyre is still good for another 1,000."

The BRITISH MADE **Watford** Speedometers

The First MOTOR CYCLE SPEEDOMETER

to enter and pass an officially observed

AUTO CYCLE UNION 3,000 MILES TEST

Venton, Totnes, July 18th, 1914.

Dear Sirs,—You will be glad to hear I won the Special Gold Medal in the Exeter M.C.C.'s Trial, held from Exeter to Staines and back last Saturday. I used one of your "Trip" Speedometers, which was most accurate, both as to speed and mileage. The hand was perfectly steady at any speed; and ran with a stop watch perfectly. The milometer registered the miles to the 10th very accurately throughout the whole trip. I consider it an ideal instrument, and speak from a good deal of experience.

(Signed) J. E. D. MOYSEY.

Type 706 **£3 3 0**
Speedometer with total mileage counter.

With Watch, **£1 - 1 - 0** extra.

THERE IS A REASON FOR WATFORD SUPREMACY.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

WANTED, modern clutch lightweight, must be cheap for cash.—Lee, 702c, Fulham Rd., London. [7196

DOUGLAS, 1913-14, 2-speed, wanted, perfect condition, fully equipped, accessories; £30 cash; deposit.—Roper, Thorpe-on-the-Hill, Lincoln. [X9913

CLYNO, Matchless, or Sunbeam 1914 Combination wanted; cash.—Ponzio, Whipp's Cross, N.E. [X9863

WANTED, sidecar, semi-T.T. bars, cut out, for Rudge.—Marks, Cranleigh, Bromley, Kent. [7260

RECENT 6h.p. A.J.S., or 5h.p. Sunbeam combination; lowest cash price.—Fergusson, Essendy, Blairgowrie. [X9458

WANTED, a 2 or 3-speed Model F.E. 2¾-3½h.p. Motor Cycle.—Box 6,673, *The Motor Cycle* Offices, Coventry. [X9744

WANTED, hub, with sprocket, for chain drive, left side, and engine sprocket.—Denholme, Ferneth, Dunkeld. [X9959

WANTED, for cash, twin 2-speed combination, modern; particulars.—109, St. Michael's Rd., Aldershot. [X9803

CASH Waiting.—Wanted, motor cycles, any condition.—Box 6,684, *The Motor Cycle* Offices, Coventry. [X9906

WANTED, 8h.p. twin air-cooled engine, cheap; give full particulars; deposit.—Hennessy, Kilbeggan, Westmeath. [X9933

WANTED, magneto, speed gear, carburetter, tyres, lamp set; cheap.—Write, Brooks, 23, Park Rd., West Green. [X9968

WANTED, 1913 6h.p. A.J.S. combination, for cash, or part exchange 1914 T.T. Douglas.—Else, Daisy Bank, Matlock. [X9914

WANTED, second-hand 6h.p. twin Peugeot, Minerva, J.A.P., also Triumph cylinder.—A.S.C., c/o Gradior Co., Stafford. [7315

WANTED, in exchange for 8h.p. twin light 2-seater, clutch model, Rudge or Triumph.—Particulars, 24, Macdonald Rd., Forest Gate, E. [6981

WANTED, 1912 2-speed 6h.p. Rex de Luxe, will give 1912 2-speed Premier and cash.—Minikin, 115, Bradford St., Keighley. [X9966

WANTED 2 or 3-speed gear, also lamp set, speedometer, good saddle, and motor cycle accessories, cheap.—125, London Rd., Manchester. [0560

WANTED, Rex front cylinder, 1908, automatic inlet valve, good condition essential.—Lowest to 22, Linwood Rd., Handsworth, Birmingham. [7157

WANTED, motor cycles, cycle cars, good cash prices. —Wandsworth Motor Exchange, Ebner St., Wandsworth Town Station. 'Phone: Battersea 327. [X6518

WANTED, clutch wheel, with controls; also Philipson pulley, tool roll, speedometer; all for Triumph; cash, or exchange Dulcephone. — Lewington, Enfield Wash. [7251

WANTED, good motor cycle, or combination, in exchange for select semi-detached house, or pair; one pays all outgoings and repayments for the two, and leaves the other free and clear for occupation or investment.—Age and particulars to Legros, Lances Rd., Mounslow. [7177

WANTED, any number of motor cycles, combinations, light cars, sidecars, engines, accessories. We buy, sell on commission, or exchange. We have several clients waiting for good machines. Send us particulars. We have the largest clientele, the finest salerooms, and obtain the highest prices; terms, testimonials, etc., on application.—Morgan and Maxwell London Motor Salerooms, 80, High Rd., Streatham, London. [X9559

EXCHANGE.

MORGAN and Maxwell, 80, High Rd., Streatham, London, for exchanges. (D) [X9955

PALMER'S Garage, Tooting, will make you a good exchange. Write for complete catalogue. [7255

EXCHANGE.

MABON Clutch, fit Minerva, for heavy 26×2¼ beaded tyre.—Crispin, 2, Chapel St., Colchester. [X9879

VIOLET Bogey Cycle Car, new, 1913, for 1914 combination.—80, Bispham Rd., Southport. [X9898

3½h.p. Centaur, low, mag., spring forks, chain drive; offers; sell £14.—39, Westmead Rd., Sutton, Surrey. [7281

3½h.p. Chain Drive Humber and 5½h.p. w.c. Benz engine; wanted, sidecar machine.—95, Alma Rd., Sheerness. [7181

EXCHANGE A.C. Sociable for piano; cash adjustment.—H.S., Popular Cafe, High Rd., South Woodford. [7198

MATCHLESS 8h.p. 1913 Sidecar Combination; would exchange for lower power.—5, Park Av., Palmer's Green, N. [X9742

5-6h.p. Rex Clutch, all fittings, for lower and cash, or sell for £15, bargain.—K., Croft Cottage, Riverbank, Staines. [7128

1914 3½h.p. Precision, soiled only, and cash, for 4½h.p. single; expert examination both ways.—Foy, Wokingham. [7129

HUMBER Van, 12h.p., 8-cwt., perfect, for combination, furniture, offers. — Hughes, Boat Builder, Selly Oak. [X9977

ENFIELD 1914 Combination; sale £70, exchange lightweight Levis, A.J.S., Douglas.—Ashcroft, Underdale Rd., Shrewsbury. [7270

EXCHANGE 1910 3½h.p. 2-speed N.S.U. with sidecar for furniture and cash.—Box 6,685, *The Motor Cycle* Offices, Coventry. [X9920

9-10h.p. Torpedo 2-seat., excellent condition, for motor cycle and sidecar, value £30.—4, Bath Buildings, Cheltenham Rd., Bristol. [X9923

PETROL Gas Plant, cheap to run; exchange for motor cycle, piano, or anything useful; sell £10.—Hughes, 5, Exeter Rd., Ellesmere Port. [7167

COLLIER'S Motories, Westgate, Halifax, quote best allowances obtainable; any exchange considered. Get our list of motor cycles, cycle cars, etc. [0446

BAT-J.A.P. 6h.p. 1912 Combination, in new condition throughout, for lower powered machine, or sell £35.—Peat, 127, Trentham St., Southfields, S.W. [7199

DE DION, 4-seater, complete, good condition, for good motor cycle; sell £40; 4-cyl. magneto for single and cash.—Registry, 47, Windsor Rd., Penarth. [X9889

1913 Scott, Senespray carburetter, Cancelet sporting hood sidecar, 2 large F.R.S. lamps, and generators, etc.; £50, or lightweight part.—Anson, Tailer, Selby. [7150

REAR 1911 Humber Frame, mudguard, kick start, 2-speed wheel complete, less 2 pinions; exchange for 45° anti twin magneto.—9a, Brightwell Crescent, Tooting. [X9880

TRADESMAN'S 3-wheel Delivery Car, 6½h.p., photo, new dry cell, accumulator, perfect, for motor cycle; sell £20.—Hawkins, Baker, Dartford, Kent. [7261

10-12h.p. Humber 2-seat. and dickey, completely equipped, perfect order; £50; exchange sidecar combination.—G. G. Williams, Crowland, Peterborough. [X9921

EXCHANGE Enfield, 2¾h.p., 1912, 2-speed, chain drive, good condition, and cash, for sidecar combination, or higher power, or sell £27.—W. Summere, West End, Honiton. [X9815

4h.p. Rex and Sidecar, Sturmey-Archer gear, Stewart, Bosch, B. and B., etc., perfect, up to date lot; £29, or gold watch and chain, or lathe part.—Johnson, 49, Renmuir St., Tooting Junction. [7155

EXCHANGE 5-6h.p. 1911 F.N. motor cycle, automatic carburetter, Xl'all saddle, shaft drive, drip feed, Bosch mag., spring forks, etc., and Millford 2-seater sidecar, with mahogany cabinet, the whole shod with new Palmer cords, 650×65, and in splendid running condition; exchange for 4-seater car, or sell £40.—B. and P. Motor Cycle Co., 89, Kingston Rd., New Malden. [7290

REPAIRERS.

ANTOINE Cylinders, pistons, and parts; prompt delivery.

CYLINDERS, crank cases welded; quotations free.

COMPRESSION Cylinders ground and new piston fitted, 24/-.

OLDEST Engines restored to highest vitality.

COMPLETE Overhauls at lowest possible prices. Full stock of Rex, Triumph, and J.A.P. parts.

COUNTER-SHAFT Gears.—We can now quote the trade for our Rex-J.A.P. 3-speed gear at inclusive prices, including fitting to old machines.—The Premier Motor Co., Ltd., Aston Rd., Birmingham. [0246

MORGAN-MAXWELL, Streatham, for cheap, good repairs. [X9954

VALVES.—Nickel steel valves, any size, 3/6; per pair 6/-.—C. R. Foster, Kirkstall Rd., Leeds. [0253

BRADBURY Spares and Repairs a speciality.—Bright and Hayles, Church St., Camberwell. 'Phone: Hop 60. [7225

BRITISH VICTORY.

1914 6 h.p. **A.J.S.** and sidecar, hood, screen, detachable wheels; original price £94 17s. 6d.; shop-soiled; reduced to ..	80 gns.
1911 **TRIUMPH**, grand condition	18 gns.
1914 **TRIUMPH** junior	40 gns.
1914 **TRIUMPH**, 3-speed, 4 h.p.	£60 0
1914 T.T. **TRIUMPH**, 4 h.p., 3-speed, Cowey speedometer, lamp, horn, etc.	50 gns.
1914 **TRIUMPH**, 4 h.p., 3-speed, speedometer, lamp, horn, etc.; cost over £65	48 gns.
1913 **DOUGLAS**, 2-speed, absolutely as new	30 gns.
1912 **DOUGLAS**	24 gns.
1913 **B.S.A.**, 2-speed, and sidecar	50 gns.
1914 **CLYNO**, 2-stroke	£30 0
1912 **ENFIELD**, 2-speed	24 gns.
1914 **IMPERIAL-J.A.P.**, 2-speed	31 gns.
ARIEL, Bosch magneto, B. & B. carburetter	10 gns.
FAFNIR	8½ gns.

LIGHT CARS IN STOCK.

1914 **PERRY** Cabrio Coupé, shop-soiled	145 gns.
1914 **PERRY**, complete, shop-soiled	120 gns.
1914 **SINGER** de Luxe, dynamo lighting set, shop-soiled	170 gns.
1914 **SINGER** de Luxe, special finish	£226 0
1914 **FORD**, 5-seater, as new	98 gns.
1913 (Sept.) **G.W.K.**, with £6 6s. lighting set	95 gns.

UNPRECEDENTED

CASH BARGAINS

Bedrock Prices. Highest Value.

This week we are offering for cash a list of second-hand machines which in other times would be cheap at 25% increase on the prices now quoted. Every machine in perfect order. The following is not the full list. Write for it.

1914 **P. & M.** 3½ h.p., 2-sp. gear	£50
1914 **LEVIS** 2½ h.p., 2-sp. gear	£38
1914 **ZENITH GRADUA** 6 h.p. Clutch	£60
1914 **JAMES** 4½ h.p. S.C. Comb.	£60
1914 **DOUGLAS** 2¾ h.p., 2-sp. gear	£38
1914 **JAMES** 3½ h.p. Twin T.T.	£48
1914 **TRIUMPH** 4 h.p., 3-sp. gear	£48
1914 **JAMES** 2¼ h.p., 2-stroke 2-sp.	£35
1913 **CHATER LEA** 8 h.p. S.C. Comb.	£58
1913 **KERRY ABINGDON**, 3-sp. and Clutch	£32
1913 **ROVER** 3½ h.p., 3-sp. and Clutch	£35
1913 **REGAL GREEN** 3½ h.p., 3-sp. and Clutch	£35
1913 **DOUGLAS** 2¾ h.p., 2-sp. gear	£34
1913 **HUMBER** 2¾ h.p. Free Engine	£28
1913 **REX SIDETTE** 5-6 h.p., 2-sp.	£38
1913 **ZENITH GRADUA** 3½ h.p. T.T.	£30
1913 **J.A.P.** 8 h.p. Mabon Clutch	£32
1912 **PREMIER** 3½ h.p., 3-sp. and Clutch	£32

REPAIRERS.

WHITTALL Machinists' Co., War Office Contractors, for all repairs.

WHITTALL.—Expert welders; repairs returned, accurately machined, inside 7 days. No charge if unsuccessful.

WHITTALL.—Re-boring and new pistons. All motor repairs. Old engines rejuvenated. All work guaranteed; no exasperating delays.—Whittall Machinists' Co., Whittall St., Birmingham. [0136

WELDINGS, Ltd., Dept. M.C., 235, Gt. Ancoats St., Manchester.—Oxy-acetylene welding experts.

BROKEN Flanges, valve seats, pistons, crank cases, water jackets, welded and machined complete.

SEND Your Old Engine or complete machine for overhauling, re-bushing, cylinders re-ground, new pistons, rings, and gudgeon pins fitted.—Weldings, Ltd., Dept. M.C., Manchester. [6234

2/6.—Genuine Nickel Steel Valves, guaranteed, any make; 2/6.—Whitehead, Rugby Rd., New Cubbington. [X9743

CYLINDERS, Crank Cases welded; quotations free; send your enquiries.—Premier Motor Co., Aston Rd., Birmingham. [0248

OXY-ACETYLENE Welding, first-class work; moderate quotations.—Purcells, 78, Charlotte St., Tottenham Court Rd., W. [6750

CRACKED Cylinders, castings, forgings, etc., successfully repaired by Lea's metallurgical process.—Lea, Engineers, Runcorn. [5197

WELDING.—All metals, cylinders, and crank cases. We have the plant, experience, and method for every job. Quick delivery.—Below.

CYLINDERS Re-ground, new pistons fitted, complete with rings, etc.; 22/6.—Oxy-Acetylene Welding, 349, Lillie Rd., Fulham. 'Phone: Hammersmith 1617. [6430

WELDING.—Broken cylinders, flanges, pistons, crank cases repaired and machined; worn valve seats built up, cracked seatings welded and machined.

CYLINDERS Re-ground, new pistons fitted complete, worn parts duplicated.—West London Welding Co., Essex Place, Chiswick. Tel.: 536. [7104

MINERVA Spares, cylinders ground, pistons fitted, rebushing, parts duplicated.—Ellenborough Motor Works, Ellenborough Rd., Wood Green, N. [8394

UNBREAKABLE Chrome-nickel Valves, guaranteed one year, 3/6 each, 6/- pair; any make, free per return.—Capacity Tool Co., Broseley, Shropshire. [X9915

CCCCCCCC Cylinders Re-bored, new pistons fitted bear 13 stone on compression.—Gradior Machine Co., Compression Specialists, Stafford. Est. 21 years. [7314

PISTON, fitted with top and bottom, step-cut rings hardened steel gudgeon pin, and your cylinder re-bored and ground, 24/-.—C. R. Foster, Kirkstall Rd., Leeds. [0310

CYLINDERS Re-ground, fitted with new piston hardened gudgeon, and step-cut rings, 85 mm 21/-; overhauls, re-bushing; estimates free.—The Motor Repair Co., Stretford, Manchester. [X9908

TONGE Welding Works, 174, Oldham Rd., Middleton Manchester.—Experts in broken cylinders, crank cases, etc. Welding aluminium a speciality. Nothing too difficult. Sound work at moderate charges. [1385

FRAME Alterations.—Triumphs, Rexes, Minervas, or any make cut down and modernised; smartens the appearance, adds pounds to value of machine, and gives 4 to 6 inches lower riding position. Estimates free.—Below.

ENGINE Efficiency.—Cylinders re-ground, new pistons fitted; highest efficiency and skilled workmanship guaranteed; phosphor bronze bushes from 2/6; valves and seatings ground true, 5/- pair; estimates submitted.—Patricroft Motor Co., Patricroft, Manchester. [6795

COMPRESSION.—Cylinders re-bored and ground, new pistons, rings, and gudgeons, complete, 16/-; overhauling, re-bushing, efficiency guaranteed. — Reliance Motor Engineering Co., Spon Lane, Smethwick, Birmingham. [7285

LOWEST Prices Quoted for any repairs or complete overhauls to motor cycles, cycle cars, or cars, or work done on the premises and fully guaranteed; cylinders cleaned by oxygen process, 2/6 single, 4/6 twin.—Maudes, 136, Gt. Portland St., W. [7354

F.N. Owners Note.—W. Earl, late foreman at the Highbury repair works, is at your disposal for all repairs. Our special engineering plant and the personal attention of a recognised F.N. expert will ensure best results at minimum expense.—Below.

F.N. Spares, special announcement.—We have a large stock of new, also sound second-hand parts. If unable to obtain certain replacements please consult us.—Below.

3-SPEED Gears for any model 4-cyl. F.N., convert your F.N. into a first-class passenger machine. We are the sole manufacturers of this gear and also the new type Horstmann 2-speed gears. Note special low prices during war period; particulars gladly on application.—Earl's Engineering Works, 5, Heath St., Hampstead. [X9955

SERVICE Reliable Repairs and Overhauls.—We will do your work at specially reduced prices during the war. Up-to-date and well equipped workshops, skilled mechanics.—1 and 2, Harpur Mews, Theobalds Rd., W.C. Offices 292, High Holborn. 'Phone: 260 Central. [7185

War Office Motor Cycles.

THERE is still a good deal of misconception in some people's minds as to the War Office requirements in respect to the type of motor cycle—more especially engine—which is demanded for despatch work. The fact that the authorities have openly announced that single-cylinder machines of approximately 3½ h.p. are preferred, but that a certain number of horizontal twins will be accepted, seems to be negatived by the appearance in photographs published in our columns of V type twin-cylinder machines of varying horse-power, and, occasionally, sidecar outfits propelled by V twin engines; but we should explain, for the benefit of the uninitiated, that at the outbreak of hostilities those motor cyclists who volunteered as despatch riders with machines of their own were accepted, provided they were physically fit and their machines in good running order, no matter what their design. The same remarks apply generally to all cases of motor cyclists attached to the different regiments throughout the country. Where the Government preference for 3½ h.p. single-cylinder machines and horizontal twins comes in is when the War Office places an order direct with a manufacturer for a batch of motor cycles, such as has been done on several occasions this year. It should be added that in recruiting the Government has shown a wise preference for volunteers who possessed their own machines, for, after all, there is everything to be gained by having riders acquainted with the running of their own mounts and thus able to get the best out of them.

On the question of the War Office ruling concerning V type engines, we must confess that we see no reason why this type of twin-cylinder engine should be barred from Government work. There seems to be a deep-rooted idea that the V type engine has faults not common to other types of motor cycles, but if big-end troubles and lubrication difficulties did exist four or five years ago, it certainly cannot be said that these are outstanding objections nowadays. The V type twin would not be so popular as it is at the present time if it were possessed of any inherent defect, and on the score of reliability there is very little to choose between a single and a V twin, though naturally the balance weighs in favour of the mono-cylinder on account of the reduced number of working parts. Weight certainly is rather against the twin, but this cannot be the War Office objection, as there would be but a few pounds difference in weight of a twin and a single-cylinder of 3½ h.p., and no special preference has hitherto been shown for light machines.

A Good Rider the Main Thing.

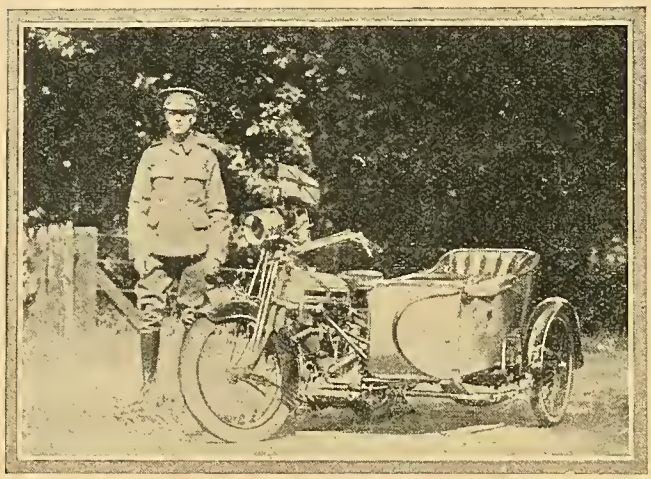
ONE feels a natural hesitation in criticising Government methods during the crisis, but a letter in the current issue, in which a well-known rider details how he has been called upon to assist three different despatch riders, seems to show that the selection of motor cyclists for such important work is not above criticism. It is one thing to select a good machine, but it is equally important to see that the rider mounted upon it is able to manage it skilfully, and, at any rate, effect ordinary running repairs. To us, the matter of careful selection of riders is far and away more important than barring twin-cylinder V type machines from the British Army. Indeed, we have not heard of a more inconsistent case than accepting a despatch rider and his V type engined motor cycle, just because he is the owner—and frequently not an expert owner at that—and yet refusing to recognise a similar type of machine when orders are being placed. Racing provides the severest test for engines, and in this department V twins have covered themselves with glory. As a matter of fact, we believe that the frame and wheels are more severely tested in military use than the engine itself. It will be seen that the Government's objection to V type engines is somewhat obscure.

SPORT AND THE CRISIS.

By ROAD RIDER.

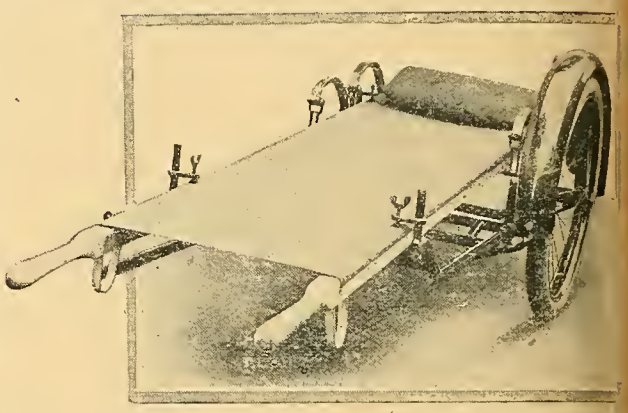
A TREMENDOUS lot of nonsense has been spoken, written, and printed anent the justification of playing games during the war. Surely it is perfectly obvious that a great many men, for a variety of reasons, cannot enlist; and that such men cannot serve their country in their peaceable professions unless they keep physically fit. To name but two professions, there are plenty of doctors and journalists who are more needed at home than abroad; the war has burdened many of them with double work, and they cannot do their work efficiently without exercise. They are therefore justified in playing golf, cricket, tennis, football—and in using their motor cycles and cycle cars for "pleasure." *It would be a national calamity if all sport were suspended.* This is my first point.

Secondly, the *outsider* cannot judge whether any chance-met individual should or should not offer himself for military training. Here is an example or two. One of my chief friends is young, sturdily-built,



Lance Corporal P. H. Blore (8 h.p. Rex sidette), one of the despatch riders attached to the East Anglian Divisional Royal Engineers who are expected to go abroad in the near future. The sidecar is also frequently used for transporting officers from one point to another.

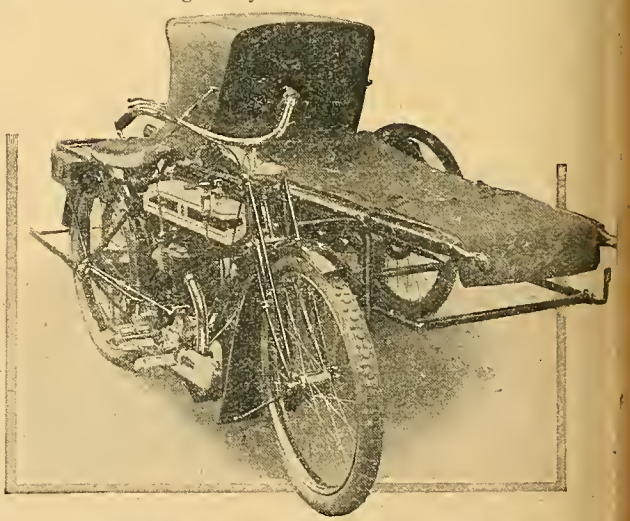
unmarried, and apparently robust. Only his intimates know that in a South American exploration he contracted an obscure intestinal trouble which absolutely disqualifies him for any violent exertion. He has had several humiliating and wholly undeserved encounters with rash and ignorant patriots; and their gibes are doubly pathetic when one knows that he is pining to be at the front, but has been told no doctor would dream of passing him. Or again; another friend of mine is an extremely hefty youth of magnificent physique, a good shot, a good horseman, and so forth. His father died last winter, leaving several helpless women totally dependent on the youngster, with a dwindling business as their sole means of support. The business is a one-man affair, and my friend has worked like a Trojan to restore it from the confusion it fell into during the father's illness. If he went to the front, the women would be penniless, the bottom would fall out of the business, and, if he ever returned,



Purcell's sidecar ambulance. It has been designed for attachment to a 7 h.p. four-cylinder F.N.

his *clientèle* would be gone—perhaps for ever, for is a middleman in a trade where the competition always furious, and more than ever furious just no

I am sure the "White Feather" brigades promenade *noisettes* and their trousered supporters doing quite as much harm as good. Moral suasi of the cowardly and indolent and selfish must left to the press and pulpit and Parliament, so as sweeping general condemnations are concerned; a faithful dealing with individuals should be left personal friends with an intimate knowledge circumstances. The present notion that every ab bodied man should enlist as a matter of course wou only be justifiable if the Allies were in grave stra and England were threatened with a most formidal invasion. Hysterical armchair panic-mongers are to forget that even under the most extreme systems conscriptions, many able-bodied youths are excus in the national interests; and that not everybody w looks able-bodied to a casual observer is necessar robust enough to join the colours.



The 1914 model Triumph motor cycle and Gloria ambulance sid stretcher—a feature of which is the spring wheel—presented by th Mayor of Coventry (Councillor S. Bettmann) to the city.

Those Valve Springs!

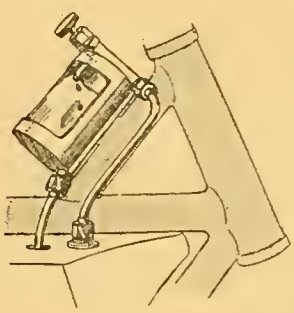
knew I was a bit of a veteran, but I can assure r Kennedy that I modestly disclaim the authorship e tip for tying up valve springs with string. It s old as the hills, and was probably the e of a very early maker. However, it otched at last, though Mr. Kennedy jokes h he pretends the string cannot be removed is woven through the coils. It may not be suffi- ly continuous to serve as braces in an emergency, you *can* get it out! Nobody but a noodle ever hed a piston ring with bits of tin, sensibly used, gh wire is better; personally, I always use three rs. Ixion's hairpins, for the inverted U prevents from tumbling out when the ring springs clear of roove. The use of a garden fork for removing he pulleys is a real novelty. I find that a pulley either swirl off when the engine is run with the nut removed, or else much strenuous work with ewclaw remover is inevitable. By the way, isn't d that garage mechanics usually refuse to employ spring removing tools, even when the manage- provide them gratis? I was in a repair shop tly, and saw five mechanics dismantling us engines. All of them used iron ingots as a, and long bars of ½in. square steel as levers, ng a pal to knock the valve down in its guide and the cotter out!

Drip-feed Lubrication.

am more sorry than surprised to hear that the e of even lubrication has received a few set- s, and that several factories are returning to the pump, and its inefficient methods of "lubricat- n spasms." The responsible designers admit the drip is superior to the pump, but assert that ideals are defeated by the crass stupidity of a entage of their customers, and that in their own ests they must adopt a system which makes the mum demand on the intelligence of riders. I there are crowds of fools about, but I am not g to lie down under this slur on the brainpans of nation and my fellow sportsmen. The dis- inting results of two years' experiments with feed lubrication are not wholly due to the public, ven to the over-numerous fools among the public. y are in no small measure ascribable to the poor n of the average drip-feed oiler, which is only a ine "sight-feed" in very rare instances. Too drip-feeds can only be deemed satisfactory they are operated by a very methodical rider, employs a milometer. You simply *cannot see* the at which the oil is flowing; and you are com- d to work on a system of letting the drip empty ump in every five, eight, or ten miles, according he capacity of the barrel. I have ridden many, y miles this season with a machine equipped with ss dome drip, and this is seldom a true "sight- " except when I am riding into the evening sun, and the low sunbeams shine towards me from behind the tumbling drops of oil. As a consequence, I have usually treated this alleged "sight-feed" as if its dome were opaque, and have simply emptied the pump every ten miles.

A Better Way.

I am coming to the conclusion that the gravity feed is grossly inferior to the crank case suction feed. A small speck of grit can choke a gravity feed, whereas the suction drip usually clears itself. The gravity feed continues when the machine is put away for the night, if there is still oil in the pump; the suction feed stops when the engine stops. The gravity feed supplies the same quantity of oil under all conditions, unless the rider corrects matters. The suction feed automatically adjusts its supply to all conditions except when a machine is slowly slogging uphill on full throttle; this latter condition seldom arises with a variable gear, and when it does arise, is easily corrected by the rider, to whose intelligence something must be entrusted. When a machine is left in garage, stupid loafers work the pump of the gravity feed, and force oil out through all the joints; no loafer can injure a suction feed. The sole defect of the suction feed is that it oils the engine when the machine is coasting long hills with the valve lifted, but there are no succession of steep hills in England long enough to make this a real nuisance, and men who ride in Scotland are usually fairly shrewd. A suction feed, with a cut-off tap, therefore strikes me as the best design.



True Visibility—a Suggestion.

Above all, the drip should be *a genuine sight-feed*. We have tried short vertical glass barrels, short horizontal glass barrels, stumpy little domes of small diameter, and the like. The size and angle of many of these glass containers render sight feeding impossible; in other cases, the glass insertion is so tiny that either vibration or capillary action soon smears the whole area of glass with a green film; and when the green film forms, the glass might just as well be stove-enamelled metal tubing for all the transparency it affords. My sketch offers a novel suggestion. Many modern frames include a short stiffening tube joining the horizontal top tube of the frame to the (practically) vertical steering head tube. This short tube comes at just the right distance from the rider's head, and its angle of forty-five degrees or thereabouts tilts it correctly for the best vision.

Occasional Comments.—

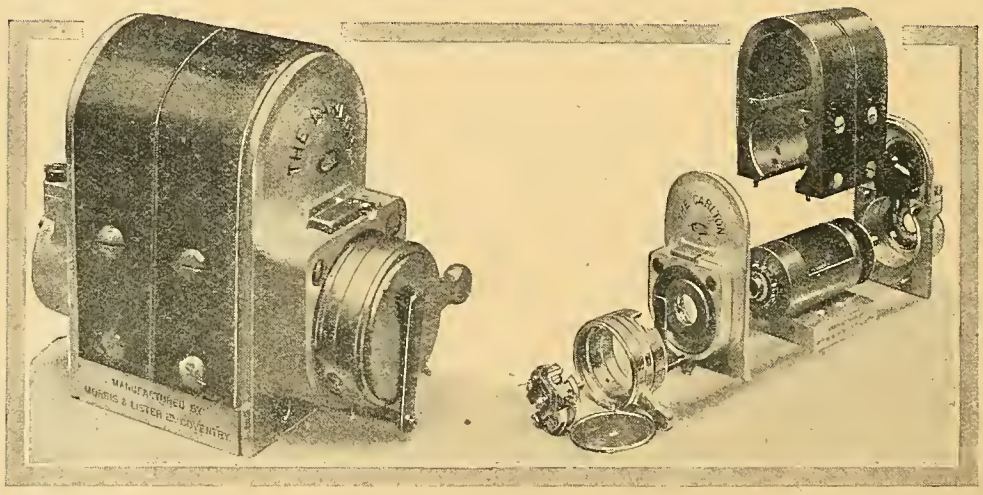
The glass drip tube should be mounted on this stiffening tube. If it is backed with glazed white material, and is made of such dimensions that neither vibration nor capillary action can stain its front arc, it should be easily and permanently transparent. The engine suction will vary the rate of speed to suit most riding circumstances, and the drip regulator will seldom need touching. There is no reason why the valve should be capable of shutting off the oil altogether; it can be so designed that at the minimum setting it will feed sufficient oil for legal limit riding; and a tap beneath it would enable the rider to stop the flow when coasting down a succession of steep hills.

The Lightweight in Traffic.

The future of the lightweight burns itself into the brain of any user who is faced with a lot of heavy traffic riding. Many years of speed work have inspired me with a natural distaste for small engines on the open road. I plead guilty to thorough enjoyment of 45 m.p.h. or more on a deserted and straight road where the surrounding scenery is dull or over-familiar; and in such circumstances I completely detest the sensation of a wee engine burbling over at 3,000 r.p.m. and the violent jars and dithers which an ordinary British highroad conveys to a physique which is becoming less sensitive with advancing years. I all open road work give me the heavy high-powe twin; I prefer 7 h.p. to 4½ h.p. and 250 lb. to 180 under such conditions. But put me in traffic and case is entirely altered. I admit that a skilled dri can thread Cheapside as surely, safely, and quic on a 7 h.p. as he can on a baby two-stroke scal 90 lb. or so. But the labour is much greater in case of the big machine; the wrists and balanc faculties are under a constant strain—so are the l when one's path ahead is blocked for a minute or t and the bulky machine must be propped; moreo the lever settings require much more care; the slig error in adjusting the throttle means that the sp will become excessive for the conditions, and the le exaggeration of an attempt to get quiet or slow runn may stop the engine, which is not designed 150 r.p.m. No, the lightweight is ineffably pleasa in such circumstances; it needs less curbing, it is ea balanced and propped, and a push from one foot st it after a stoppage. My stable usually houses sam of every type, and I have often noticed that I a matically select the baby of the family when I faced with the crossing of three or four big cities a long day's run, though the monster is unleas when it's a case of hey! for the West or North!

A NEW BRITISH MAGNETO.

The Carlton, the Second Instrument to be Produced in Coventry.



THE NEW CARLT ALL-BRITISH MAGN SHOWN COMPLET AND DISSECTED IT IS DESIGNED STANDARD LINE

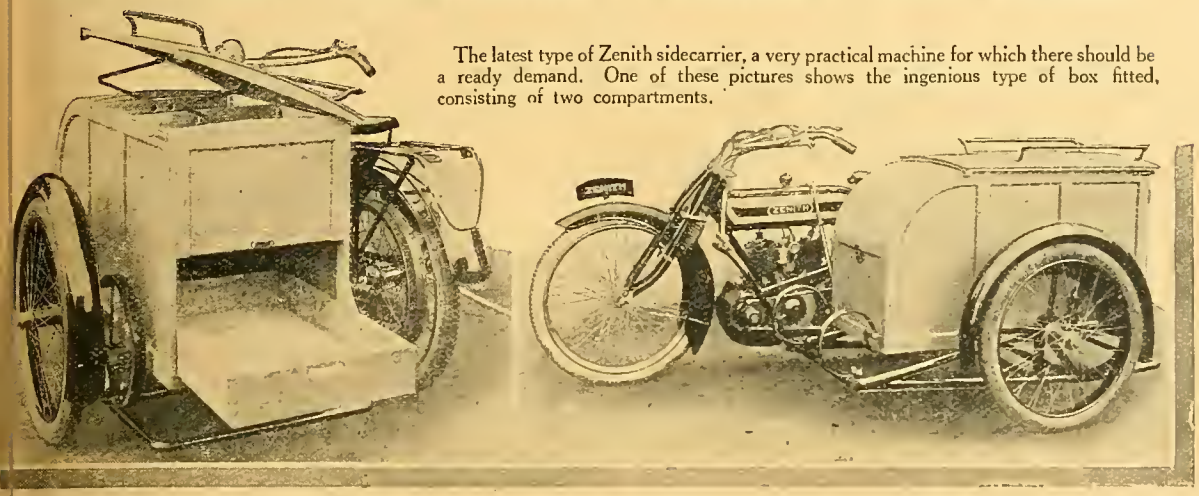
ENGLISH manufacturers have not been slow to realise the possibilities of a considerable trade in magnetos as an immediate result of the present war. Messrs. Morris and Lister, the well-known electrical engineers of Lockhurst Lane, Coventry, have completed the first of a large batch of magnetos suitable for single-cylinder engines. The instrument, which is to be known as the Carlton, is manufactured throughout by the firm and is designed on standard lines with two horseshoe magnets to the base of which the pole pieces are attached. The armature is laminated and of the H type, the winding being a fine piece of work. Both ends are mounted on ball bearings, and watertight aluminium end plates render the working parts immune from water and grit. The high-tension terminal also is waterti and the contact-breaker is of the usual bell cr type. Throughout the workmanship is excellent, the external appearance is neat and businesslike, as easily be perceived from the above illustration.

It is hoped that delivery in considerable quant will be made within six weeks, as the jigs machine tools are all in readiness and the works h been largely devoted to the rapid turning out of t machines.

Apparently the German magnetos, which h hitherto held such an all-conquering sway in British market, will soon be supplanted by so machines of home construction, as several British fi are tackling the problem.

PROGRESS OF THE SIDECARRIER.

Latest Specimens of Business Sidecars for Tradesmen's Delivery Purposes.



The latest type of Zenith sidecarrier, a very practical machine for which there should be a ready demand. One of these pictures shows the ingenious type of box fitted, consisting of two compartments.

THE WATSONIAN.

OLDING sidecars have hitherto been the main features of the products of Messrs. the Watsonian Folding Sidecar Co., Ltd., Conybeare Street, ringham, but now that firm is marketing an exceedingly neat and businesslike commercial sidecarrier. The body is of three-ply material, and opens both at the rear and the top, and is both light and roomy. Care has been taken efficiently to guard the sidecar wheel, and careful provision has been made to guard against side roll when under load.

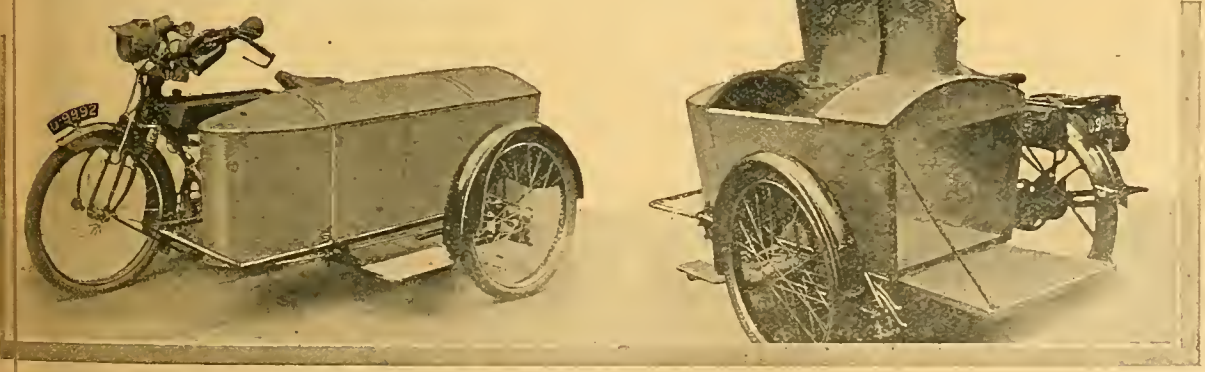
he Watsonian sidecarrier chassis showing method of springing.

THE SERVICE SIDECARRIER UNIT.

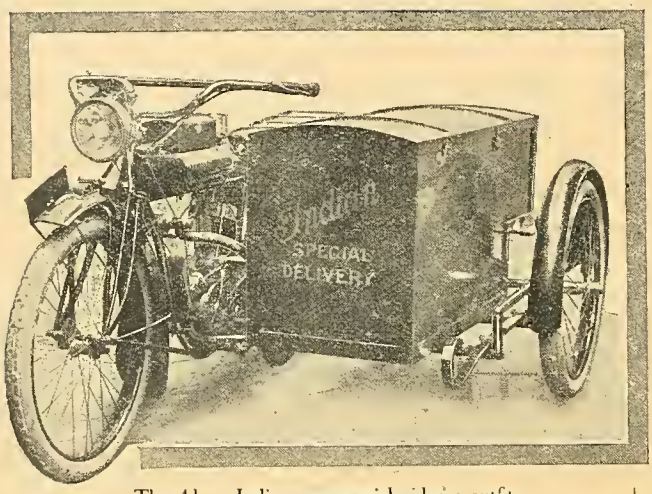
The Service Co., Ltd., 292, High Holborn, W.C., have, like many other firms, turned their attention to the production of a sidecarrier, but have specialised in a slightly unconventional form of attachment, which is moderate in price and light in weight. It will be seen from the accompanying picture that the box is of wicker and is unsprung. The chassis is the ordinary passenger type attached to the motor cycle at four points; while the basket may

The Service wicker sidecarrier attachment.

sidecarrier introduced by the Watsonian Folding Sidecar Co. to meet the demand created by the shortage of horses.



Progress of the Sidecarrier.—



The 4 h.p. Indian commercial sidecar outfit.

be removed and a body fitted in a few minutes. The sidecarrier is designed to appeal specially to the small tradesman, who can fix it to a good single-cylinder, second-hand two or three-speed machine, which may be purchased for about £30.

THE INDIAN.

It has persistently been advocated in this journal that manufacturers should devote their attention to the tradesman's sidecarrier, and it is not, therefore, surprising that so up-to-date a firm as the Hendee Mfg. Co. have seriously gone in for this type of attachment, for which there is likely to be a very brisk demand. The carrier is a very practical one, being divided into two portions, the front portion, which is dropped, being of large dimensions, while the back portion comprises a small locker with a separate door at the rear. The whole job is very well carried out. It possesses the advantage that it is absolutely interchangeable with the sidecar body, and therefore it should especially appeal to the tradesman who cares to use the machine occasionally for his own pleasure. The cost of the outfit with box body and standard sidecar chassis, and attached to a 4 h.p. two-speed Indian, is £75.

MOTOR CYCLE RACING IN ITALY.

WE learn that there are still some few competitions being held in Italy despite the unsettled state of that country owing to the possibility of intervention in the war. It is interesting to hear, too, that on all sides sympathy is expressed towards the Allies. On Sept. 13th the Sports Club of Milan held its annual motor cycle championship race over 100 kilometres, and it resulted in a triumph for English machines, five out of the first seven finishers being mounted on our products. The result was as follows: 1, Cavedini (Triumph), in 1h 27m. 20s. (equal to 43.7 m.p.h.); 2, Bracchi (Sunbeam); 3, Gambini (N.S U); 4, Scotti (N.U.T.); 5, Costa (Douglas); 6, Cavazzoni (Frera); and 7, Head (Forward).

On October 4th the Italian Track Championships will be held at Milan by the Moto Club d'Italia.

THE AUTO-SIDECAR.

THE Auto-Sidecar is designed to be attached to an ordinary gentleman's or lady's pedal cycle. The motive power is a small two-stroke engine mounted on the chassis of the sidecar in a triangular frame, the petrol tank being carried in the apex of the triangle. The drive is by chain to the counter-shaft situated behind the motor; on the end of this shaft a pulley is fixed, the final drive being by belt. The whole of the control is from the handle-bars. The carburetter is of the automatic one-lever type, and the lever and that working the release valve are the only two to be manipulated by the driver. The makers suggest that in the event of a breakdown the pedal cycle may be detached and ridden to the nearest garage. In the particulars given there is no mention of a change speed gear, but if such a fitment were incorporated in the design there is no doubt that a remarkably handy little mount would have been evolved. As it is the machine is suitable for a runabout in level country. The makers are the Auto-Sidecar Company, Perseverance House, Cut Town, London, E.

The Auto Sidecar, which consists of a motor-propelled sidecar attached to a pedal cycle.

Hints for Beginners.

FOURTH INSTALMENT.

ADJUSTMENTS.

Chains.

WHEN adjusting chains it is most important to turn the wheels round and test the adjustment at various points, as it is very seldom t the chain tension remains constant at all points. ving found the position in which the chain is i test, adjust till all slackness is removed, but the in is not really taut. A tight chain is certain to ak its rollers, and an unduly loose chain likely to the same thing, also a tight chain puts a great in upon frame and engine bearing.

Wheels and Head.

he wheels will not often require adjustment, but y should be tested fairly frequently and promptly usted when necessary, as a loose wheel wears its rings rapidly. When a wheel is correctly adjusted hould not be possible to feel any side play, but the ght of the valve should be sufficient to revolve the el when suspended. The adjustment should be ed after the lock nuts have been fixed, as these etimes have a tendency to tighten the bearings. e head should also be carefully adjusted in the e way.

Tappets.

f your machine has adjustable tappets, these uld be examined frequently as they are very liable hift unless screwed very firmly home, and incorrect ustment will affect the running of the engine very ersely and cause undue valve clatter, especially in case of overhead valves. Some allowance must made for the lengthening of the valve stems by t or the valves will not close properly when the ine has been running for a few minutes, and consequently the compression will be lost; "about the kness of a visiting card" is the usually prescribed wance. A smaller gap is required when the valves overhead, as the valve stems are shorter and the tappets are not seriously affected by heat. In case a just perceptible movement is sufficient. er any tappet adjustments it is advisable to test compression when the engine is hot; many engines very stiff when cold, and this may give a false idea good compression.

Testing the Compression.

his may be done by putting in the top gear and hing the machine slowly along the road, or by ing it on the stand and moving the back wheel hand; if the resistance of the compression is ht and quickly overcome by a steady pressure e is a leak somewhere, but before jumping to the clusion that it is due to valve leakage (unless it tested and found satisfactory before the adjustnts were made) it is as well to test all the cylinder ts, valve caps, sparking plugs, etc., by putting a e oil round the edges, when, if there is a leak at any of these points when turning the engine over against compression, it will soon be detected by means of the bubbles which will appear at the defective point. This is a very old tip, but it may not be generally known amongst novices, and, as a man often begins with a second-hand machine which may be much improved by a little tuning up, it is well worth knowing.

Removing Carbon.

A very effective wire brush for cleaning the head of the cylinder can be made from a piece of file card costing 1d. or 2d. This should be glued or tacked to a round piece of wood about 1in. in thickness and slightly smaller in diameter than the cylinder. A square iron rod or a screwdriver bit is driven into the back and it then can be used in a brace, but it is advisable to chip off the worst of the carbon first with a screwdriver or similar tool. This will quickly remove the small particles of carbon and impart as much polish as the roughness of the cylinder head will allow.

HOW MOTOR CYCLE DESPATCH RIDERS ARE ARMED.

Motor cycle despatch riders are armed with revolvers, and the illustration shows two of these riders loading up before setting forth on a hurried journey.

Vigilance on the East Coast. How Spies are Guarded Against.

OUR correspondent on the East Coast during mobilisation sends us the following interesting notes:

I was just preparing to take a rest after an arduous tour through Devonshire when the war broke out, and before I had time to look round I received a wire from *The Motor Cycle* instructing me to proceed to the East Coast and hunt up copy and photographs describing the war-like preparations for the defence of our shores. The war fever was in the air. Troops had been mobilised, the "Terriers" had been called up, motor cyclist messengers were rushing to and fro, military camps were springing up like mushrooms on vacant lands and commons, and it was known that on the East Coast in particular unceasing vigilance was being displayed to thwart any attempt at a hostile invasion. A journey along the seaboard of the South-Eastern Counties promised a full measure of exciting experiences. Let me say that having some inkling of what might be in store for me, I took the editor's letter of instructions with me as my credentials, and before leaving Doncaster I carried it to the chief constable and persuaded him to endorse it on the back. How the letter and the endorsement fared will be seen as the story progresses.

I selected Harwich as a starting point. Between Doncaster and Bury St. Edmunds nothing occurred out of the common. It was the afternoon of a beautiful day in the height of the harvest season. The countryside was flooded with golden sunshine, the noise of the reaper came to me from both sides of the road, and many a time I had to dodge heavy-footed horses as they slowly pulled the corn-laden wains from field to stackyard. The only signs of war were a few groups of Yeomanry here and there as I entered Huntingdon.

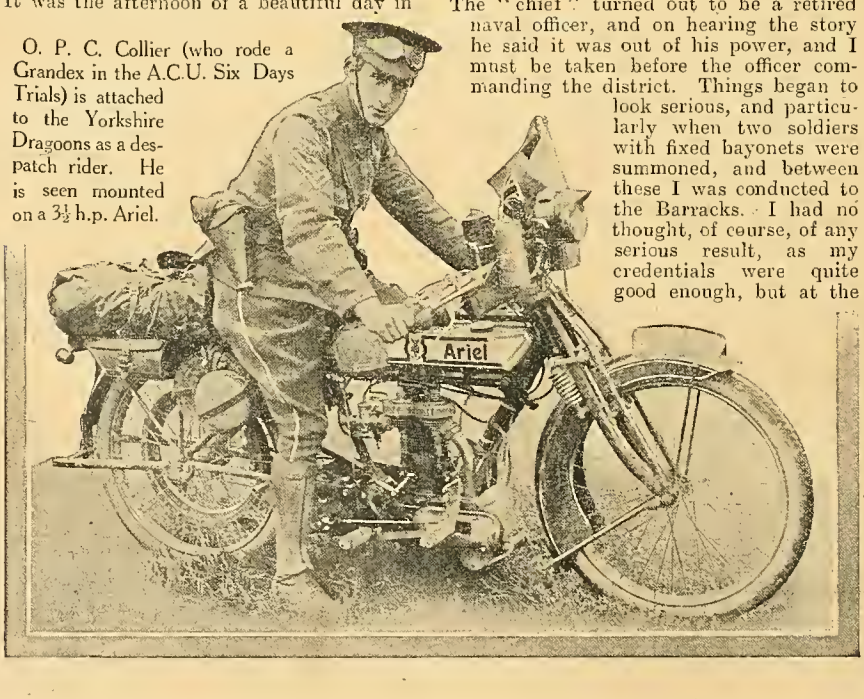
I Get Arrested.

The first real incident occurred at Ipswich. Just before reaching the town I passed numerous motor cyclist despatch riders, and I made a few enquiries from them as to what was happening. A little further on, as I was nearing Ipswich Barracks, I came across a Daimler motor lorry taking in supplies of butcher's meat. Here was likely material for a photograph, illustrating as it did the use of the motor in warfare; so I stopped and made a picture. I was putting away my camera when a man came up on a bicycle and accosted me. He proved to be an officer in *mufti*. He asked me whether I had permission to do this sort of thing and who I was doing it for. I showed him my papers, but he appeared unsatisfied, and in the end he asked me to accompany him to the Town Hall to see his chief. I asked him what I should do with my sidecar, and he answered, "Leave it there and I will send a man to look after it." The "chief" turned out to be a retired naval officer, and on hearing the story he said it was out of his power, and I must be taken before the officer commanding the district. Things began to look serious, and particularly when two soldiers with fixed bayonets were summoned, and between these I was conducted to the Barracks. I had no thought, of course, of any serious result, as my credentials were quite good enough, but at the same time I could hardly help feeling grateful that my captors were British officers and not Germans. To make a long story short, I was led into the presence of the officer commanding, my guards beside me, and my camera and plates under my arms. The officer asked me for my papers, and I produced them. He told me this was not the time to take photographs. To this I replied that my instructions were to take photographs showing the utility of the motor in time of war, and not to hamper or give away the disposition of troops in the least. He gave orders that my plates should be developed, and I was to be kept in custody until further instructions. So the procession was reformed and we returned to the Town Hall, where I had to turn out my pockets, to be searched for arms, and even to open a sealed envelope containing a supply of the new £1 notes I had taken for the expenses of my journey. The officers admitted these were the first samples of the new currency they had seen, and their examination was not minute. While I was in custody other officers came in and cross-examined me, and during this time somebody was telephoning to Doncaster enquiring into my *bona fides*.

By and by an officer came and said a reply had been received from the police at Doncaster, fully bearing out my statement, and I was to be allowed to go about my business. They were quite apologetic and very nice about it. They told me there were a great number of foreigners about, and naturally they had their orders to be on the alert. They had only exercised reasonable precaution, and I could hardly grumble. So on this I was set at liberty. I found afterwards that the telephone message to the Doncaster police, and the fact that the Ipswich officer was good enough to put a verification on the back of the edited original letter of instructions to me, stood me in good stead on subsequent stages of my journey.

Adventures at Lowestoft.

Naturally, I was not sorry to leave Ipswich. It had cost me a number of plates and two hours' unpleasant detention, and the open road seemed very attractive by comparison with the close in barrack and the armed guard. I struck out towards Yarmouth. Between Ipswich and Yarmouth I took a number of photographs which have already appeared in this journal. On this section officers in charge gave me all possible facilities. Later, I came upon the London Cyclists, a corps of motor cyclists, and after a pleasant time with them I arranged to join them next day at Lowestoft, where I was to spend the



O. P. C. Collier (who rode a Grandex in the A.C.U. Six Days Trials) is attached to the Yorkshire Dragoons as a despatch rider. He is seen mounted on a 3½ h.p. Ariel.

Military Motor Cycling Notes.—

night. It was at Lowestoft that I was again "held up."

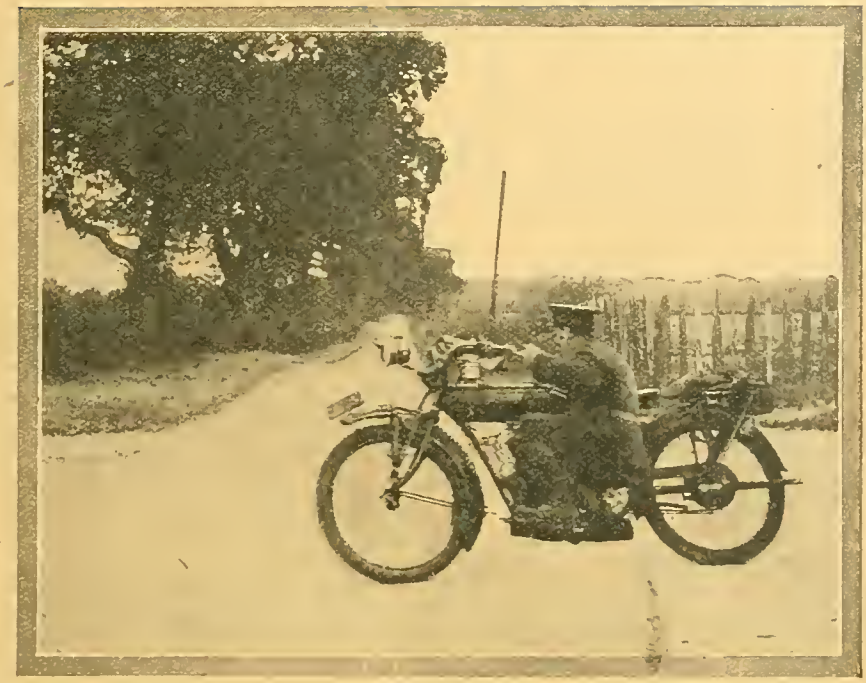
Early in the morning I heard a tremendous lot of cheering. I went out to investigate, and found that a number of trawlers were just leaving the harbour to go out and sweep the seas for German mines. Thinking there might be something in this worth taking I went on the pier, leaving my machine at the entrance. Nothing of interest transpired, and I came away a quarter of an hour after. Just as I was leaving the pier a plain clothes man and a police sergeant came up and asked me who I was, and, fortunately, I was able to satisfy them with a sight of my papers. All the same, they were leaving nothing to chance. When I reached the pier gate I found two policemen on guard over my machine. The sergeant informed them that all was right, and they left me in peace to depart. As a precaution I went back to the police office and got them to sign my pass—making another signature to the number. After that I had no more trouble of any sort, though I was frequently stopped and my papers examined. At one place I met Captain Trappman, of the London Cyclist Battalion; he knew me personally, and added his signature to the others.

A Souvenir of the Trip.

Subsequently I covered 300 miles up and down the East Coast and took a great number of photographs. Finally, I left Yarmouth one evening at five o'clock and made a night run to Doncaster. One thing I shall never part with—the editor's letter of instruction, now worn and crumpled, but valuable on account of the ten signatures and stamps behind it of the military and police with whom I came in contact.

THE EARLIEST ARMOURED MOTOR CYCLE.

In our leading article on motor cycle machine guns, which appeared in our issue of September 18th, reference was made to the vehicle used by Mr. F. R. Simms at the Richmond Automobile Show, held by the then Automobile Club of Great Britain and Ireland. By the courtesy of Mr. F. R. Simms, who was one of the founder members of the above-named body, now the Royal Automobile Club, and its first vice-chairman, we are enabled to reproduce a picture of the Beeston quadricycle upon which the Maxim gun was mounted. It was built by the Beeston Motor Cycle Co., of Coventry, to the specification of Mr. Simms, who was certainly the pioneer of the armoured motor vehicle, as in 1902 he constructed for Messrs. Vickers, Son and Maxim an armour-plated war car for coast and road defence and street fighting, and also an armour-plated motor railway inspection car for the same firm.



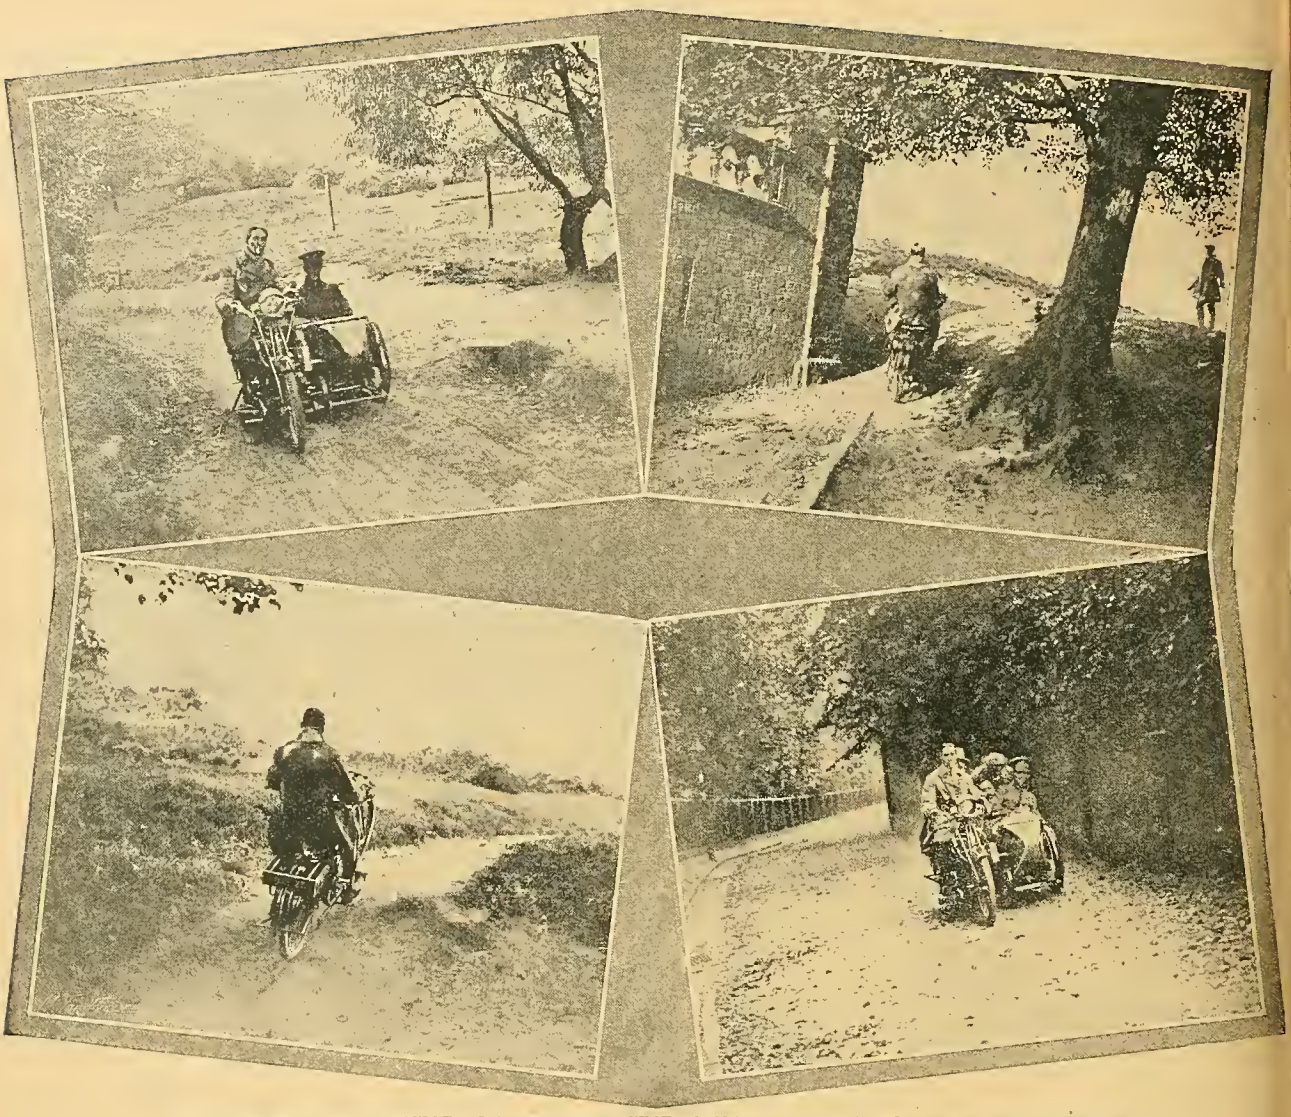
Corporal Taylor, who is attached to the West Riding Royal Engineers, crossing a right-angled road. If Corporal Taylor should by chance meet the enemy's patrols, his skill as a trick riding motor cyclist should stand him in good stead.

HUMBER WORKS BUSY ON MOTOR CYCLES.

The Humber Company's works are at full pressure executing a large order for standard pattern 3½ h.p. Humber motor cycles for the Russian Government. The tests which led to the order are described on another page of this issue, and quick delivery is a condition of the order.

The Humber machines have three-speed Sturmey-Archer hub gears, Dunlop tyres and belt, B. and B. carburetter, and Lycett saddle. All the Russian machines will be finished a khaki colour with the exception of a small batch which will be taken from stock.

The first motor cycle Maxim gun attached to a Beeston quadricycle, and demonstrated by Mr. F. R. Simms at the Richmond show in 1899.



TESTING BRITISH MOTOR CYCLES FOR THE RUSSIAN ARMY. (See article on opposite page.)

(1) The sandy-surfaced lane on Hampstead Heath.

(2) The portion of the course shown has a gradient of 1 in 2 for a yard or so. The machine depicted is a 3½ h.p. Premier.

(3) A test of crank-case clearance. In this case the Sunbeam excelled.

(4) Five up on Swain's Lane on a 7-9 h.p. twin Premier sidecar driven by J. Oliphant.

CLYNOS FOR THE WAR OFFICE.

We hear that the War Office Authorities have favoured the Clyno Engineering Co., Ltd., with a large order for sidecar outfits The excellent detachable and interchangeable wheels on the Clyno should render it particularly suitable for army use.

SENDING GOODS TO THE ARMY.

Messrs. Neale and Wilkinson, Ltd., shipping agents, of 32, St. Mary Axe, London, E.C., and 60, Hanover Street, Liverpool, undertake to forward, free of charge, and under certain conditions, parcels for the troops serving at the front. Particulars can be obtained from the firm.

COMPONENTS TO THE FRONT.

We are informed that 200 of the employees of Messrs. Components, Ltd., of Bournbrook, Birmingham, have joined the Colours, and provision is being made by the company for the wives and families of those who have gone to the front.

PREMIERS FOR RUSSIA.

The Premier Cycle Co., Ltd., Coventry, has received an order for several hundred Premier motor cycles from the Russian Government as the result of the tests illustrated above. The model chosen was the three-speed counter-shaft type, which has been so successful in the Trials this year. A smaller number of the big Premier twins has also been ordered.

DESPATCH RIDERS INVALUABLE.

A motor cycle despatch rider, writing to his father, a Hereford alderman, reports that he has had a very interesting but a very hard time. About three weeks ago he was chased for four miles by German Lancers. They were, of course, on horses, and he was on his machine, but the road was so bad that they nearly captured him. However, he got away.

An officer writing from the Front says that the motor cycle despatch riders have done splendid work. They are constantly under fire, and have had to run the gauntlet many a time.

In fact, from all sources, we continue to hear the most excellent reports of the services of these plucky riders.

TESTING BRITISH MOTOR CYCLES for the Russian Army

THE Russian Government has lately been occupied in buying a number of motor vehicles for the use of its army. Early last week one of the Russian military motor experts, Captain Mgebroff, asked for a number of machines of well-known makes to be presented at the Hotel Cecil for his inspection. Their drivers little thought they would have to do anything more than bring their machines round to be examined, and when they found that they had to hurry on to Hampstead to undergo a test they were not a little surprised. The trials lasted several days as the makes included Sunbeam, Humber, Triumph, P. and M., Douglas, James, Indian, Matchless, Premier, Enfield, Chater-Lea, Rudge, and Bradbury.

On arriving at Hampstead the machines were sent up the famous test hills of the Metropolis, first West Hill, Highgate, and then Swain's Lane. These have gradients of one in nine and one in six respectively. The Premier and Humber sidecars had to take five up the latter slope, which they succeeded in doing with ease. The Russian Government representative proved himself to be an excellent sportsman and tried several of the solo machines by riding on the carrier and making them take him up the more severe gradients.

Real Colonial Tracks.

The two hills just mentioned were much too easy for the Russian Captain; they were steep enough it is true, but their surfaces little represented the conditions which are encountered in the march of the army of the Tsar. We thought we knew the London test hills pretty well, but it was only on Saturday that we learned that within a few yards of the Spaniards, on Hampstead Heath, there are two hills of respectable gradient with surfaces which have a very close resemblance to Colonial roads. The first of these has a surface of fairly deep sand, which, when wet, is particularly clinging, and here the motor cycles had to stop and restart. Not a few failed in this test, and when the riders were asked to take the bank, which was extremely rough and had a gradient of about one in three, several refused. Finally, when Captain Mgebroff, while riding on the carrier of one of the machines attempting this test, found himself on the ground, even he was forced to admit that the trial was a trifle severe, and kept on his feet for the rest of the morning.

The 3½ Humber sidecar also took five up Swain's Lane. This was no mean performance, and another machine to qualify in this respect was the Matchless. Further tests included starting in the middle of Swain's Lane with a passenger on the carrier, and the most successful solo machines were the 2¾ and 3½ h.p. Sunbeams and the Premier. A further trial was the speed test in Bishop's Avenue. Probably the most severe of the performances was the re-starting test on the hill with the sandy surface, which caused several failures. The final stage of the test was the negotiation of a neighbouring hill on which the surface was crossed transversely by the roots of trees, at times standing three inches above the ground. Altogether the manufacturers of five makes of motor cycles—the James, Premier, Sunbeam, Chater-Lea, and Humber—were successful in obtaining valuable orders, and these have to be executed in three weeks or less, so that they may arrive at Archangel before that port is closed by ice for the winter months; once at that port the machines can be distributed by rail.

1915 MODELS AND "THE MOTOR CYCLE."

ANNUAL BUYERS' GUIDE IN NOVEMBER.

New models are now occupying the attention of manufacturers, and the pages of "The Motor Cycle" during the next month or two will be particularly interesting to motor cyclists and prospective riders. The earliest descriptions of new model motor cycles regularly appear in these columns; the accounts are penned by technical writers in interesting yet non-technical language, whilst sketches of mechanical details and photographs are a feature.

In November, a special Buyers' Guide issue of "The Motor Cycle" will be published, giving the specifications of all the leading 1915 models. This annual feature will prove more valuable this year than ever before in view of the manufacturers' decision not to hold a Show.

Sidecar Records at Brooklands.

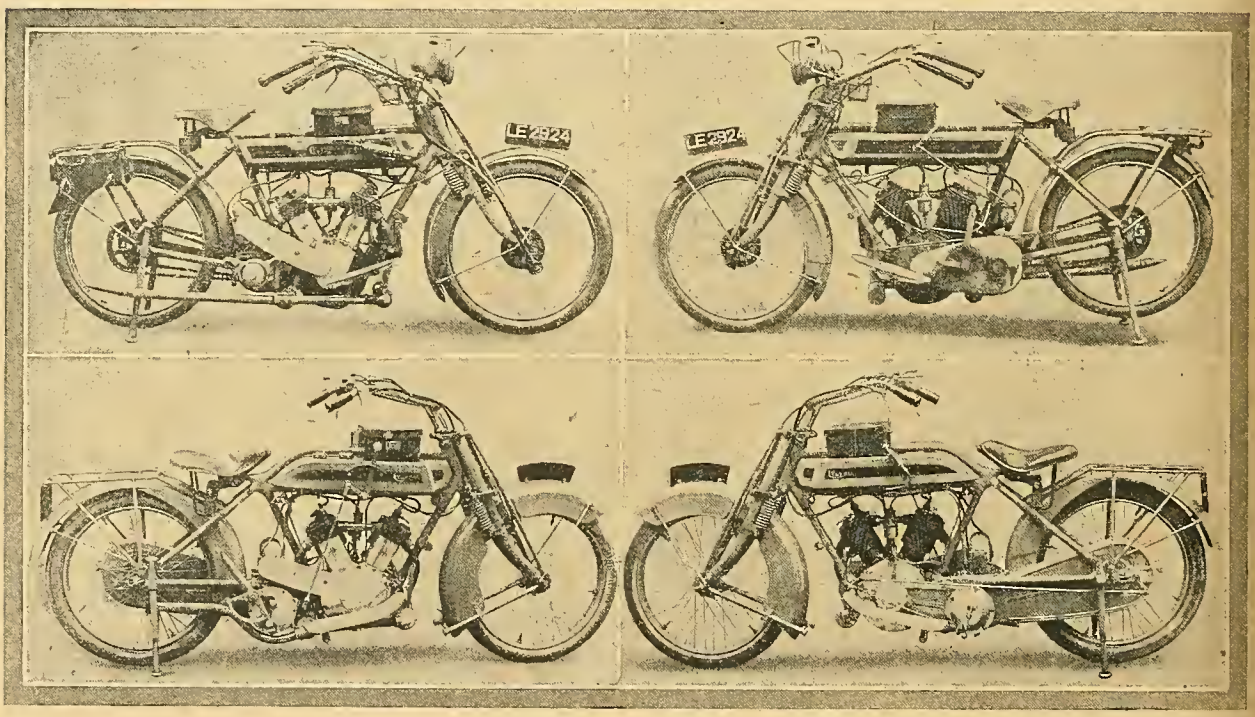
ON Tuesday, September 22nd, S. L. Bailey broke the following 350 c.c. Class F sidecar records, driving a 2¾ h.p. Douglas twin-cylinder machine, 60.9 mm. × 59.7 mm. bore and stroke, 349 c.c., wiping out the figures made by T. B. Haddock and H. A. Rhodes on a 2¾ h.p. A.J.S.

	New Records.	*Previous Best.*
	m. s. m.p.h.	m. s. m.p.h.
Flying kilometre ...	42.2 = 53.0 ...	42.8 = 52.27
Flying mile	1 8.2 = 52.79 ...	1 11 = 50.70
Flying five miles ...	5 46 = 52.02 ...	6 26.2 = 46.60
Standing ten miles ...	12 5.2 = 49.64 ...	14 6.2 = 42.55
One hour	43 miles	41 miles
	1730 yds. = 43.98 ...	757 yds. = 41.43

Bailey's Douglas was fitted with Hutchinson tyres, Lyso belt, Fischer magneto, and he used Mex spirit, Price's oil through a B. and L. drip lubricator, and a Rally sidecar.

The fastest lap in the hour attempt was covered at a speed of 50.64 m.p.h., and the slowest from a standing start 48.10 m.p.h. It is probable that Bailey would have completed fifty miles or nearly in the sixty minutes but for bad luck at the end, for he had to stop for a broken rocker in the last eight minutes. This may be called a wonderful performance for a 350 c.c. machine pulling a sidecar and passenger. The unusual cylinder dimensions should be noted.

New Lamps for Old: A Modern Version.



A 1912 CLYNO BROUGHT UP-TO-DATE.

(1) The 1912 two-speed Clyno, valve side. (2) Transmission side (1912 model).
(3) Valve side of the converted Clyno with three-speed gear. (4) Transmission side when brought up to date.

THE four interesting photographs show the latest scheme evolved by the Clyno Engineering Co., Ltd., Wolverhampton, of converting a 1912 model to an up-to-date machine. In order properly to appreciate the conversion it is necessary to study first of all the two photographs of the 1912 model. Beginning with the latter, it will be seen on looking at the picture of the transmission side that the frame has a straight top tube, the spark lever is controlled from the tank, the mudguards are on the small side and the forks narrow, while the footboards are of meagre dimensions. The photograph showing the valve side of the engine indicates that a two-speed gear of the clutch type is fitted, controlled by pedals, and that there are two chains from gear box to rear axle, both of which are exposed. Turning then to the converted model, it will be seen that there are only two chains, which are completely enclosed, and a good plate clutch is fitted to the countershaft of the three-speed gear box, while the spark lever is controlled by Bowden mechanism. The improvement in the mudguarding is also clearly evident.

The machine is practically as good as the newest and latest 1914 models. The cost of the conversion, which means removing the engine from the old frame, overhauling it, fitting it in a new one with a modern tank, gear box, magneto control, gate change, improved footboards and exhaust disposition, detachable wheels, etc., is twenty-eight guineas, while for an extra £3 10s. the latest type of mudguards, front stand, and wider and stronger spring forks with 1914 front brakes are supplied.

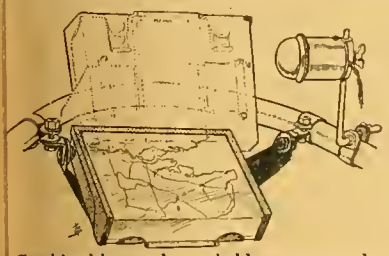
AMONG THE ACCESSORIES.

The Vevo Union.

A neat little device of ts kind is the Vevo nion, made by Arthur . Price, Vevo Works, ark Lane, Aston, Bir- ingham, for working wo lamps from a single enerator. It is finished n polished brass, and an be attached quite easily.

Highly Useful for Despatch Riders.

Many military motor cyclists will oubtless have found some difficulty in arrying maps and memo. pads when iding their machines. There is, however, device made under Waigh's patents, nd sold by the Service Co., Ltd., which e illustrate herewith. The holder itself made in the form of a box, the upper alf of which is provided with a celluloid asing in which the map is positioned. he supports are held on swivels so that

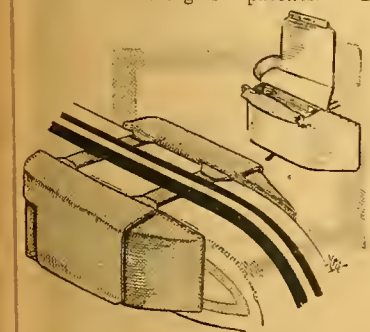


Combined box and map holder constructed under Waigh's patent.

e whole box can be turned round, and the under side is a small memo pad nd pencil. The interior is fairly large, nd there would be quite room enough for couple of Browning pistols and any espatches or papers that it is necessary carry. In connection with this the mpany also sell a useful little handle- r electric light. This has universal ovement, and can be used for illumi- ting the map and for reading signposts night.

A Useful Fitment.

A useful pair of combined knee grips d tool bags is being marketed by A. . Gamage, Ltd., Holborn, E.C., and ade under Waigh's patents. The



Gamage's combined knee-grip and tool bag.

nnier bags are quite large and capable holding such things as puncture ont- s and the smaller tools such as anners.

Transfer Flags.

The transfer flags issued by our publishers are proving very popular among motor cyclists, a large batch of orders following the first announcement. It may be mentioned that the Japanese flag has been added, making a range of five flags of the Allies. They are issued in correct colours, of a size 3½in. × 3¾in., and are obtainable from Iliffe and Sons Ltd., Coventry, and 20, Tudor Street, London, E.C., at 7d. post free for one flag, 1s. 1d. for two flags. etc.

Adjustable Point Plug.

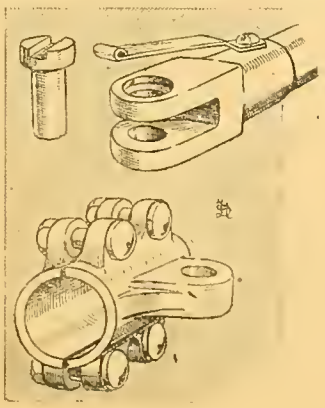
Few people realise how much difference can be made in the running of an engine by suitably adjusting the sparking plug gap. In the early days of magneto ignition motor cyclists were advised to set the plug points a distance of .4 of a millimetre, which was sometimes roughly translated as being as close as possible without touching. As, however, magnetos came into general use and more came to be learned about them, this exceedingly small gap was found to be inefficient. It appears that under certain conditions a small gap and low compression gives easy starting. In these days of high compression a large gap is better. In its effort to leap across the distance the spark is intensified, and is much hotter than when the path is too easy for it. Again, when the gap is altered according to the speed of the engine, better results may be obtained with the points further apart at very high speeds, while misfiring occurs at low speeds if the points are too close together. To overcome these difficulties, Messrs. J. H. Runbaken, 7, Peter Street, Manchester, have introduced a particularly well-made plug with an adjustable gap. The body of the plug is steel, and the insulated portion steatite, the point being of the best possible material. To the end of the electrode is fastened a large milled nut, and lower down a pointer running over a graduated scale, showing the amount of gap given. The illustration renders the plug self-explanatory. This is not an experiment, as quite a few years ago Mr. S. H. Arnott made himself a plug of this type for his 5-6 h.p. V.S. ("Humming Bird"), on which he did some wonderful times at the earlier B.M.C.R.C. meetings.

New Dynamo Lighting Set.

A new sidecar and cycle car dynamo lighting set is being introduced by Thompson and Co., Endyne Works, Greenwich. The dynamo is driven either by belt or friction pulley, and two G.W.K.'s have just been fitted with the installation. The firm undertakes the fitting to any sidecar or cycle car at the cost price only of the work during the war.

A Neat Sidecar Clip.

Among the many quick detachable sidecar lugs now on the market, one of the neatest and simplest we have seen is that patented by Mr. A. Wain of the Atlas Engineering Co., Hill Street, Coventry. Simplicity and strength are its salient

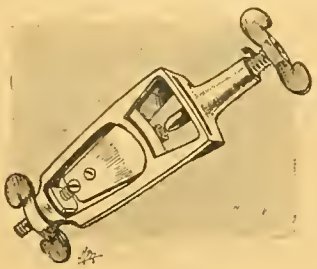


The Atlas quick detachable sidecar clip.

features, and probably no type is easier of attachment The usual jaw lugs are used, and through the bolt hole passes a plain round headed pin. The head drops into a slight recess formed in the top part of the jaw, and a leaf spring pivoted on the shank of the lug drops into a broad slot machined in the pin head. The spring, though quite strong enough to prevent any movement of the pin, is easily moved by the finger, and should never set up rattle.

Combined Belt Cutter and Punch.

Although punching holes in a belt is a comparatively simple matter, it is not always so simple to cut off the old end



Piggott's guillotine belt cutter and punch.

of the belt unless one is possessed of an exceptionally good knife. To obviate this difficulty, Messrs. Piggott, Cheapside, E.C., have produced a combined guillotine belt cutter and punch, which will be found admirable in use, and the action of which is clearly explained in the accompanying sketch.

NOTICE.

Polhill. A Warning.

Motor cyclists are cautioned against trespassing anywhere near the high wooded banks at the top of Polhill on Sevenoaks Road, or to the right of Westerham Hill. Cameras should not be used at either of these places.

Petrol at 1s. a Gallon.

Our leaderette on this subject is exciting considerable interest. The writer of a letter, which we publish in this issue, announces the advent of a satisfactory spirit at 10½d. a gallon, and another correspondent offers to form a private syndicate for the supply of benzole at 1s. in ten gallon drums.

Government Orders for Motors and Cycles

The cycle and motor trade generally is coming in for a large share of Government contracts, for many thousands of pounds worth of motor lorries are in course of construction. Cycles, too, have been ordered in hundreds, the Centaur Company's order representing the largest ever placed in the Coventry district for pedal cycles.

A Novel Sidecar Load.

On arriving at the receiving stores at Woolwich with a load of blankets on her P. and M. sidecar, Mrs. Hardee was informed, that her parcel was the first to arrive on a motor cycle. She told a friend that her contribution looked very insignificant amongst the huge piles from all parts, which were being despatched to the front. Mrs. Hardee is also engaged in Red Cross work, and at the week-end had a wounded soldier as passenger.

Motor Cycle Thieves at Work.

It seems that at the present time a gang of thieves is at work around London stealing motor cycles. A reader was recently demonstrating a Douglas machine to a probable buyer, who had professed to be somewhat ignorant of motor cycle matters. However, managing to get astride the machine he pushed off, started the engine, disappeared round the corner, and since then no trace of him has been found. The machine is a 1914 T.T. Douglas Model V., registration number AN 1499, engine number 14391, gear box number 10746, cycle number 13975. Any information concerning this machine should be sent to G. A. C. Greenop, The New Hermitage, Upper Norwood, S.E.

Scholarships for Coach Building.

The London County Council offers three scholarships of two years' duration, value £15 a year, to boys more than sixteen and not less than fourteen years of age on March 31st, 1915, who pass the requisite examination in motor body building. Instruction is given at the Regent Street Polytechnic, W. Candidates will be required to take an examination on or about December 8th, 1914. Particulars can be obtained from Mr. R. Blair, Education Officer, L.C.C. Education Offices, Victoria Embankment, W.C.

Motor Cyclists and the Wounded.

Over a score of sidecar combinations, owned by members and friends of the Woolwich club, have been placed at the disposal of wounded and convalescent soldiers at the Military Hospital at Woolwich. The organiser, Mr. W. Whittaker, has been informed by the medical officer that the invitation will be accepted, although at present there were more than sufficient motor cars at their disposal. It is intended to arrange a series of runs over Kent roads, and the soldier passengers would be given tea at Green Street Green. Mr. Whittaker has notified the hospital that the machines are available at short notice.

SPECIAL FEATURES.

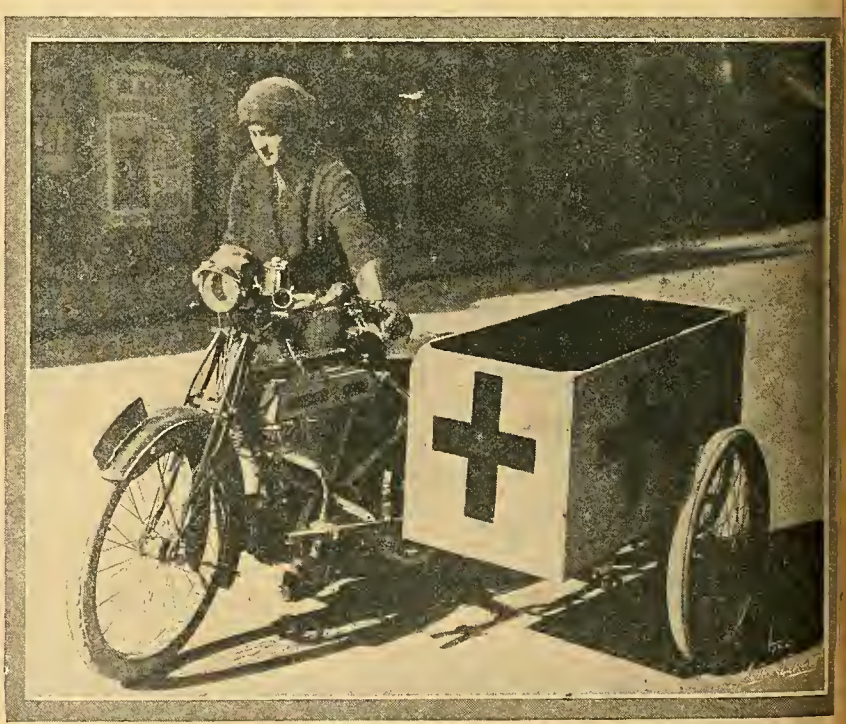
TESTING BRITISH MOTOR CYCLES FOR THE RUSSIAN ARMY.
A NEW SHAFT-DRIVEN MACHINE.
THE WAR OFFICE AND V TWINS.

Indians Retire from Track Racing.

According to an American contemporary the Hendee Manufacturing Co. has definitely decided to withdraw from American track racing, and will only participate in long distance road races such as those held on the Elgin and Savannah circuits.

Motor Cyclists with the Canadian Contingent.

We learn from the *Montreal Mail* that a number of Montreal men offered to equip a motor cycle corps of one hundred and twenty-five men to go with the Canadian contingent to the front, and Col. the Hon. Sam Hughes accepted the offer.



Miss Norman of Fleet (Hants) who has volunteered as a member of the Ambulance section. Several members of her family are already serving their country. The machine is a 3½ h.p. Blackburne.

"The Motor Cycle" Buyers' Guide.

The annual Buyers' Guide issue of *The Motor Cycle*, to be published next month, will prove more than usually interesting this year in view of the decision not to hold a Show.

Trapping as Usual.

"Business as usual" is apparently the motto of the Greenwich police engaged in motor trapping. A short distance trap was in operation at Lewisham High Road last week, and at least one O.H.M.S. machine was stopped.

To Aid the Belgians.

We are informed that all entrance fees for the next sporting trial of the Mersey (Liverpool) M.C., which is to be held next week over a course of fifty miles, will be handed over to the Belgian Refugee Relief Fund. What we owe to the wonderful courage of this nation can hardly be expressed in words. We trust, therefore, that a substantial amount will be raised.

Sidecars for Simla Mails.

We hear that the Director General of Posts and Telegraphs at Simla, India, has ordered twenty motor cycle and sidecar carriers for distribution of the local mails. This is meant to be a trial, and if, as is confidently expected, the experiment prove a success, further Government orders are expected. According to *The Bombay Times* the Director General said "the motor cycle has arrived at such a state of perfection that we think we are justified in generally adopting it. In any case it is considerably cheaper to run than the horse-drawn vehicle, and enables a much quicker service to be provided."

A Winter Programme.

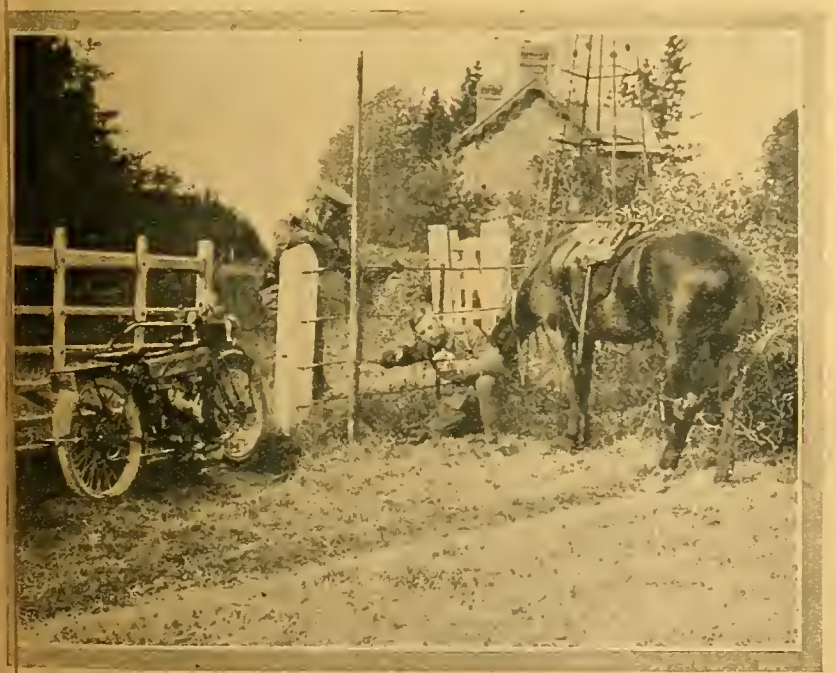
The Finsbury Park C. and M.C.C. has decided to hold social evenings at headquarters on the first Wednesday in each month during the winter. Whist, followed by music, is suggested as the entertainment.

Another Despatch Rider Wounded.

Another motor cyclist despatch rider has been invalided home from the front in Howard Riddell, of Birmingham, who was formerly employed by Messrs. F. E. Baker, Ltd., makers of the Precision engine. Riddell was wounded internally, but we are glad to say is progressing favourably, and hopes to be out of hospital in a month's time. He was one of the first motor cyclists to be sent abroad with the British Expeditionary Force, and was attached to the Royal Engineers.

The A.C.U. Handbook.

As it has been felt that many clubs need more guidance in the matter of holding competitions than is contained in the open competition rules of the A.C.U., it has been proposed to include in the handbook for 1915 a series of articles on the subject of open and closed competitions with model entry forms and explanatory notes. Judging from the number of requests that reach us, especially from secretaries of new clubs, for help in the matter of holding all kinds of competitions, we should say that such a handbook would prove to be most useful. The lists of appointed hotels and repairers and other matters of interest to tourists will be in a separate publication, known as the A.C.U. Touring Guide.



THE USES OF MOTOR CYCLISTS IN WAR.

Motor cyclists are proving themselves extremely useful in detecting faults in the field telephones. The rider of the P. and M. shown, having discovered a defect, brings along a patrol of the Telegraph Section who rectifies the fault, which was caused by a farm cart breaking the wire when passing underneath

Main Contents of this Issue.

We continue our first descriptions and illustrations of new models this week with the Rex-Humphris three-speed gear and shaft drive, and also illustrations of the latest specimens of sidecarriers. An exclusive feature of special interest to motor cyclists and manufacturers alike is the account of the tests of British motor cycles for the Russian Army. Large orders have followed these Government tests, which will keep thousands of workmen busy for some weeks.

A Brooklands Notice.

Owing to the exigencies of military requirements the general public will not be admitted, until further notice, to the Brooklands Motor Course and Flying Ground after Wednesday, 30th September, 1914.

Members of the Brooklands Automobile Racing Club, Brooklands Lawn Tennis Club, and British Motor Cycle Racing Club, as well as holders of permanent passes, will continue to be admitted subject to the conditions heretofore in force.

Applications for tests and speed trials should be addressed to the Secretary of the B.A.R.C. at Carlton House, Regent Street, London, S.W., who will make arrangements if military requirements permit.

The Last Straw—

The stages through which the average owner of a sidecar passes are interesting. He begins, as a rule, with wondering if his 3½ h.p. solo machine is capable of drawing a sidecar, but after a rather nervous start decides perhaps it is. His next thought is whether it can possibly draw three persons, and forthwith a friend is installed on the carrier. Then a couple of youngsters are ensconced in the sidecar at the feet of their mother and a few unconsidered trifles such as tea baskets, luggage, a petrol tin, etc., stowed away in odd places. And still the uncomplaining 3½ tugs away. One of these days we think we shall have a try to design a sidecar outfit for *really* serious work, such as for accommodating a family of ten, or taking a battalion of troops to camp, or a pack of foxhounds to the meet! Really, some of the examples of overloading we have recently seen on the roads prompt us to wonder what will be the final straw to break the mechanical camel's back!

Cycle and Motor Trades Benevolent Fund.

The usual monthly meeting of the Executive Committee was held on the 24th ult., with Mr. Citroen in the chair. The treasurer's report, showing a balance at the bank and in hand of £821 1s. 3d., was presented.

Among the sixty-two applications for relief dealt with by the committee seventeen were owing to the effect of the war on the trade. In two cases the Fund was able to supplement the amount granted by the National Relief Fund to dependents of subscribers who had joined the Colours. In twenty-three cases relief was granted owing to inability to work on account of illness or old age; in two cases arrangements were made for the nomination of children of deceased subscribers to orphanages, while grants were made to seventeen widows or other dependents of deceased subscribers.

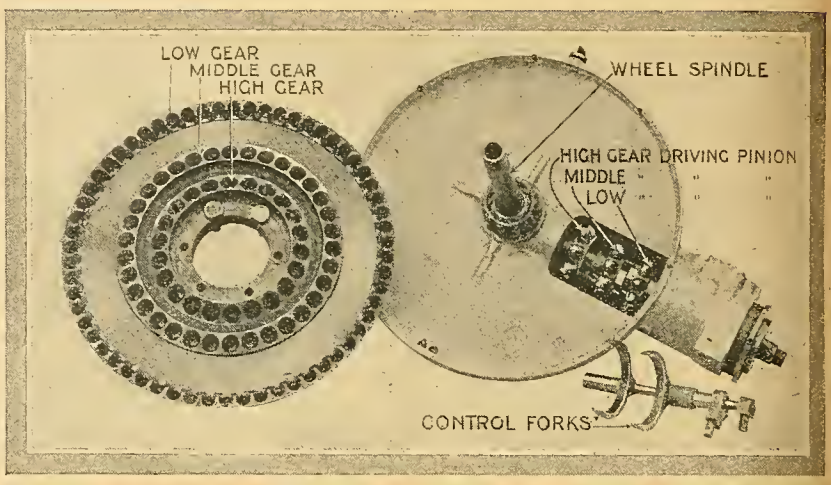
IMPORTANT REX DEVELOPMENT.

Adoption of the Humphris Three-speed Gear, Shaft-drive, and Positive Gate Change.

REX design is usually original, and the latest development is one of the most interesting bits of design we have seen for some years on a motor cycle. It is no less than the adoption of shaft-drive and a special form of the Humphris gear. This gear, which is of a most unusual kind, is no untried novelty, except in its adaptation to motor cycles, for it has been in constant use for long periods on many tramways and railways, including such well-known lines as the Piccadilly Tube and the London, Brighton, and South Coast Electric Railway. Besides this, it has been thoroughly tested on cars.

The Rex Company have had an experimental machine on the road for some time past, and are so satisfied with the results obtained that they have decided to standardise the drive for the twin-cylinder sidecar model in 1915.

We personally were privileged to inspect an experimental model machine over two months ago, and since then many many miles have been covered on it under all conditions. A single-cylinder machine has also been used to test the gear, so that its reliability and efficiency has been proved to the satisfaction of the Rex Co.



The new Rex-Humphris gear. The driven disc has been removed to show its construction, and also the three driving pinions which mesh with corresponding holes in the disc. When assembled, the gear is carried in an oil-tight case.

The Lay-out of the Drive.

The engine is placed in the frame in the usual manner, but has an extension on the driving side to take the clutch and front end of the driving-shaft, which lie at right angles to the crank. The drive is transmitted to the clutch shell by a pinion, the teeth of which may best be described as helmet shaped. These teeth, or pegs, engage with holes in the bevelled face of the clutch shell and transmit the drive something after the manner of a bevel. Both the design and manufacture of the gear have been the subject of most exhaustive tests, with the result that the makers claim a very high degree of efficiency and silence and extreme durability. It is one of the interesting features of the gear that no thrust is imposed on the driving pinions, and consequently thrust races are not required for the crankshaft or gear-driving pinions.

How the Gear is Operated.

The gear itself is formed with the rear hub and is driven from the clutch by means of an enclosed propeller-shaft, at each end of which is a simple sliding coupling. To provide the three separate ratios, a single driven disc is employed, having formed on it three concentric rings of recesses, into which fit the pegs or teeth of the three driving pinions. The high and middle gear pinions are always in mesh, the high gear being locked to the driving-shaft by a special dog clutch. Middle gear is brought into operation by another pair of dogs formed on the end of the low gear pinion, and to obtain the lowest ratio the low gear driver is slid into mesh with the outer ring of recesses, which are specially shaped to allow this action. The whole gear is enclosed in an

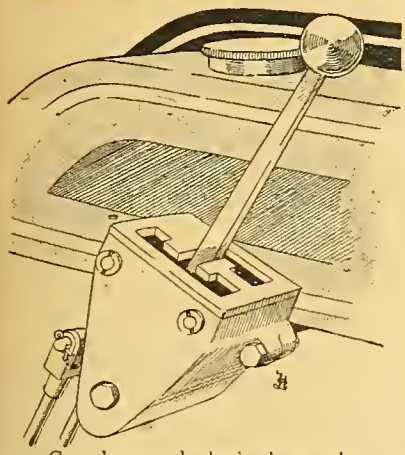
Important Rex Development.—



Gate change and selecting box on the 1915 model Rex.

oil-tight case, and the driven disc is bolted to the hub, the load and thrust being taken by Timken roller bearings.

The selecting mechanism is neatly enclosed in the compact gate box and is positive in action, so that it is quite impossible to mesh two gears at once. Two control rods pass from the selecting box to the striking forks, which are mounted just in front of the driving pinions, and control them through simple and substantial mechanism.

Tyre and Wheel Removal Quite Simple.

To facilitate tyre removal a distance piece is arranged on the side of the wheel opposite to the gear, and this is made wide enough to allow the cover or tube to be removed without disturbing the wheel, especially as the brake is mounted on the same side as the gear. It is, however, a simple job to remove the wheel complete with the gear, which may be detached from the rear end of the driving-shaft.

Much might be written on the shape and methods of generating the teeth, but the subject is a long one, and good results are the best guarantee of both design and workmanship.

It may be mentioned that the set of gears illustrated in this article have undergone several thousand miles severe road testing, and when closely examined prove to be practically unaffected by wear.

There are many who have been clamouring for a machine of this type, and the new Rex should have a big future, especially for sidecar work and for those who require a clean, totally enclosed, and permanently adjusted fool-proof transmission.

CLUB NEWS.

Wolverhampton M.C.C.

Owing to lack of entries the Twenty-four Hours' Trial was postponed, and, as so many of the members are leaving to join the Army, competitions are cancelled for the present.

Sutton Coldfield and Mid-Warwickshire A.C.

It has been decided that the reliability trials for the Levis Cup and the P. J. Evans Cycle Car Trophy, usually held about this date, should be deferred until the exceptional conditions now prevailing have abated, as the committee feel that no good purpose could be served by holding these trials, but that possible hindrance might be caused to the military and police in the districts through which the competitors would pass.

Acton and District M.C. and C.C.C.

The second meeting of the above club was held at the King's Head Hotel, Acton, on September 17th. The chair was taken by Dr. A. M. Low, president of the club. The business of the evening was devoted to the election of officers and committee, and to the amendment of certain of the club rules. A challenge trophy has been offered and was accepted.

A social run has been arranged by the committee to take place on Saturday, the 3rd inst., starting from the King's Head Hotel, Acton, at 2.30 p.m. All motor cyclists in Acton and the surrounding district are cordially invited to attend. Further particulars from Mr. E. B. Hunt, hon. secretary, 47, Woodfield Crescent, Ealing, W.

It is proposed to form a Wolverhampton non-military motor cycle body, and the riders shown met on Penn Common at the beginning of the week to discuss the matter. A further meeting is to be held on the 11th inst. at 11 a.m.

Noisy Motor Cycles: Suggestions for a Cure.

A Plea for Silence in Engine and Transmission. General Notes on Design.

REFERENCE has recently been made in *The Motor Cycle* to the noisiness of motor cycles and the consequent difficulty of easy conversation between driver and passenger in the case of a sidecar combination. It seems somewhat incongruous that a relatively tiny motor cycle should create so much objectionable noise whilst the big 40 h.p. car can travel quite noiselessly. Why cannot the modern motor cycle be made as silent as the modern car? There is a great charm in the silent running vehicle, and many motor cyclists must wish their machines would run nearly as silently as they do when free-wheeling down a long hill with the engine stopped and the clutch out.

Just as to-day there is no market for a noisy car so may we expect that to-morrow there will be none for a noisy motor cycle. The two principal sources of noise in a motor cycle are the exhaust and the transmission. Engines should be more effectively silenced and means provided for deadening the clatter of the valves. The long exhaust pipe is a step in the right direction as it takes the exhaust to the rear, but larger exhaust boxes would add to the improvement. Valve clatter might be lessened by employing slightly larger valves and a smaller valve lift and also by using fibre-topped tappets and careful adjustment of the latter. A valve cover might help matters. A silent engine calls for silent transmission, and this will probably lead to modification in gears and drives.

Of course the direct belt drive is absolutely silent and by no means objectionable now that modern belts (of good section) are so good and reliable. Untunately chain drive is by no means noiseless, and when the engine is silent chain noise will be more pronounced and, therefore, more objectionable, so it is quite possible our noiseless engine will cause the chain to be discarded in favour of belt or shaft. It may also be expected that a silent engine will show up the defects of the sliding type of gear and cause the epicyclic type to come into general use. This, however, will be to the good, as this type is not only noiseless when in use, but it also changes easily and silently, and has the further advantage in having no idly revolving gear wheels on the direct drive.

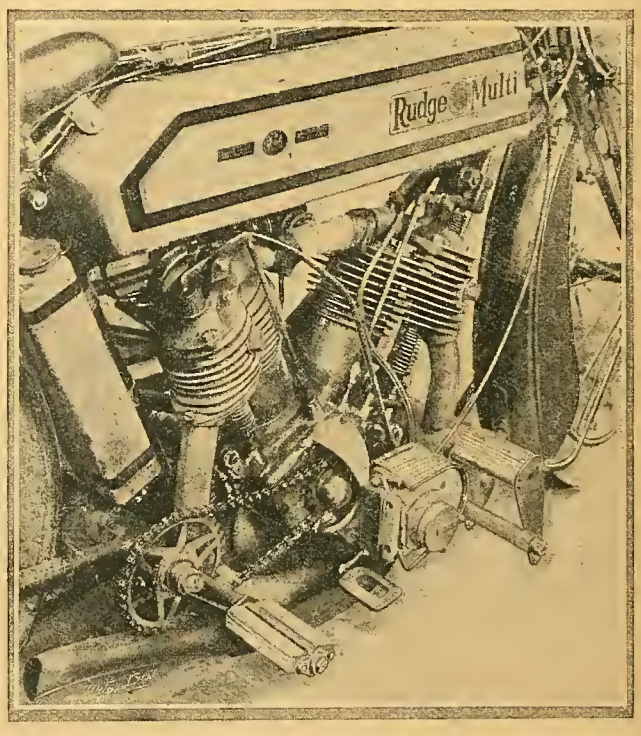
The Disposition of the Gear.

In the writer's opinion, motor cycle manufacturers might with advantage follow the latest Daimler practice with regard to the disposition of the main parts. In this the engine and clutch are in a forward position and the gear incorporated with the back axle. The motor cycle equivalent would have the engine and clutch close together (or as a unit) and the gear (minus the clutch and its parts) in the hub. In the case of shaft drive we could follow F.N. practice up to a certain point, but in place of the sliding type of gear employ a hub gear. Such an arrangement would give an excellent transmission, and by transferring the gear to the hub we get silent gears combined with easier gear-changing. On the other hand, if shaft drive is not desired, it would perhaps be the best practice to drive by silent chain from the engine to a counter-shaft and mount a neat and compact plate clutch on the latter. The secondary part of the drive from the counter-shaft plate clutch could be by belt or chain. As regards the type of gear suggested it should be remembered that one half of a three-speed hub is occupied by the clutch, so that if we remove the clutch and its parts we not only make a considerable reduction in the weight of the hub, but we also get a very simple gear. Such a gear could be packed with a thicker oil than usual and, except for an occasional adjustment, could be forgotten and yet be safely relied upon to do its work quietly and efficiently and with perfectly smooth gear changes.

Advantages of a Counter-shaft Clutch.

A self-contained counter-shaft clutch arranged independently of any gear is quite an attractive proposition. Such a clutch could be made very light and compact, whilst its adjustment or removal could be quite easily effected. There are, in fact, several big advantages in placing the clutch in the counter-shaft position and the gear in the hub, quite apart from the question of silence, although the latter is the primary object of the idea.

In the counter-shaft position the clutch connects the two elements (chain and belt or two chains) of the drive, and if properly adjusted this should prove an advantage, by softening the drive, especially on bad roads. There is also the important consideration that we need only employ a light transmission, as there is no falling off in belt speed when the low gears are working, and the transmission would, therefore, last longer and give less trouble.—ENGINEER.



Ingenious method of using the magneto clip as a foot plate which is being tried on the latest pattern twin-Rudge. The magneto is driven direct from the camshaft, and is fixed to a stout bracket formed on the timing cover.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Standardisation of Controls.

Sir,—Is it too much to ask the makers to standardise the carburetter controls for next year? I am a motor cyclist of a year's experience, and was recently driving a friend's machine and sidecar of another make, and although *perfectly aware* that his throttle and air levers worked in the opposite direction to those on my machine, I accidentally opened the throttle wide instead of closing it, resulting in landing in a three foot deep ditch. Given time to think, one would not make such a mistake, but in an emergency, force of habit is sure to tell.

A. F. EDWARDS.

Petrol Consumption in Trials.

Sir,—One sees trials of motor cycles intended to bring out every point of importance except one, *i.e.*, efficiency with regard to petrol consumption. I am sure there are many like myself to whom the amount of petrol consumed per mile is a serious consideration and ought to have makers' attention. There is probably a difference between single and multi-cylinders and the build of a machine to take more or less propelling force. Some trials to emphasise this point would be very instructive and useful in selecting a machine.

GEORGE POTT.

Continental Patents.

Sir,—Further information has been received in this country as to special temporary provisions which have been made with reference to patents in certain Continental countries. Up to the date of writing no intimation has been received that German or Austrian patents owned by Englishmen will be interfered with, but it is highly probable that special regulations will be made with regard to these. The provisions, which are too lengthy to deal with in full, specify that extensions of time for any steps can be had from three to six months in the case of countries that are at war. Certain temporary alterations have been made in the procedure in Holland and Switzerland, so that it is advisable that those owning patents, or having applications pending, in the countries mentioned should ascertain the details of the new arrangements.

ERIC W. WALFORD.

Lightweight T.T. and Two-stroke Matters.

Sir,—Having read your recent articles on the proposals for having a T.T. race for lightweights, might I be permitted to say how welcome an event of this sort would be to those who wish to enter for this race, but who have not the courage to face having to compete with men who can corner at speeds which we would be nervous of attaining on straight roads. Apart from this it would do an infinite amount of good in developing this branch of the pastime, which is at present in its infancy. It would also go far in showing which is the best type of engine to adopt, the two or the four-stroke. Personally, I have owned both types, and I will never go back to the poppet valve type. I have owned a Scott for the last six months, and have had it to bits once, more for curiosity than anything else. The machine had covered 1,500 miles, but I never touched the pistons, as there was no carbon to chip off. In a country where one cannot always get spares it is an infinite relief to know that the parts of an engine which give most trouble, valves and tappets, are non-existent. Then again, when one has to be out sometimes in the day, when the temperature is anything between 140° and 160°, one begins to realise the benefits of water cooling. I did a run of twenty miles the other day in a temperature which raised blisters on the soles of my feet, and there was not a drop out of the radiator cap to indicate boiling. I was warned against trouble which I was piling up in getting a two-stroke in the first place, and water-cooled at that, but as long as there is a machine with brains behind it like the Scott, I will never touch anything else. There is a fortune for the firm which first makes a horizontally opposed water-cooled two-stroke. I have adopted mixing my oil with the petrol, though not recommended, and find it answers admirably. I put in four wine-glassfuls to the two gallons, and use the drip feed as an auxiliary if necessary. I would like to express my regret at the Scotts losing the T.T., and also the hard luck which attended the Collier brothers. I should have liked the latter to win, if only once and for all to ram the *anno domini* question down the throat of the tactful. If the Scott people make a lightweight I am in for the proposed T.T., if I can get leave to get home.

THE MOONSHI.

Punjab, India, August 19th, 1914.

Dissolved Acetylene.

Sir,—We notice under the heading "Dissolved Acetylene," in your issue of September 17th, an article which mentions our system of lighting, the sole defect, according to the writer, being the difficulty in storing the D.A. cylinder on a motor cycle.

We should be much obliged to receive the suggestions of "Ixion" as to the position which he would consider ideal, and which might be taken as the standard position for our lighting cylinder. As far as we are concerned, we find that nearly every make of machine and every rider requires the cylinder placed in a different position. We are always open to receive suggestions, and should be very glad if the writer of the article would communicate his views on the matter to us.

Further, a letter appears in your issue of September 17th over the name of "Nocarbide," giving the reader's reasons for using the D.A. system. Your correspondent states, however, that he does not consistently obtain twenty-four hours light from his six cubic feet of gas, the utmost he has obtained being eighteen hours.

May we draw attention to the following points? (1.) The manufacturers cannot guarantee a period of lighting, but they do guarantee every cylinder to contain six cubic feet of gas. (2.) If the burner used is true, and consumes, as it should do, seven litres per hour, and all connections are gas tight, then a six cubic feet D.A. cylinder will undoubtedly supply twenty-four hours light. (3.) If any customer receive against his payment of the usual price, a cylinder containing less than six cubic feet, the manufacturers guarantee to exchange it for a full cylinder free of any charge.

If these points be carefully considered, we feel sure that your correspondent will see that the proper use of the D.A. system is not only a luxury, but an actual economy.

THE ACETYLENE ILLUMINATING CO., LTD.

Indicator Diagrams.

Sir,—I see in *The Motor Cycle* for September 17th a very interesting letter over the signature of "Indicator." I also well recollect your articles in 1904 on the subject of "Indicator Diagrams and Petrol Engines." The whole point really is that with small high-speed engines most indicator diagrams so suffered from vibration and inertia effects on

both the gaseous and mechanical sides that it is difficult to get really reliable information. By means of what one may most conveniently call an oscillagraphic manograph it is possible to study with great accuracy the pressure variations in the working cylinder, and this, in conjunction with movable platinum thermometers and cross windows, forms a most valuable addition to the accurate study of high-speed engines. I might add that for many years I have written on the subject and advocated the use of indicators, even to the extent of showing different diagrams to readers.

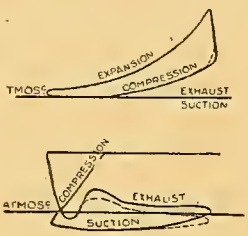
I frequently use a machine in my own work which could be applied with ease to an ordinary motor cycle engine in many cases without removing it from the frame, although, needless to say, very great care is necessary in manipulating this as with most other physical apparatus.

A. M. LOW, A.C.G.I., D.Sc., etc.

Sir,—Lest any ambitious "tuner up" should go to the expense and trouble of procuring an indicator and tackle, may I say a few words?

The indicator is not of much use unless the engine is running at somewhere near the full load. One can only imagine the harm that would be done to a motor cycle engine by running it at full load on the stand. The high speed also more or less puts the ordinary indicator out of the question, since these instruments do not give satisfactory results at over 400 r.p.m.

"Indicator" was correct in the main essentials of his diagrams, though, of course, the faults he illustrated were very much exaggerated. I enclose copies of two normal diagrams, the first being a full load card with a heavy spring and the second a light spring card showing the action of the suction and exhaust.



In the first card a normal pre-ignition, such as would be known as a "knock" in a motor cycle, is shown dotted. In the second diagram the exhaust is choked slightly, and with better silencing arrangements the dotted form would be obtained. The second diagram is, of course, a reproduction of the bottom part of the first to a much larger scale.

The only real use that the indicator would be on a motor cycle would be to show how the cylinder was filling and clearing itself, and also how the spark was timed. Even then it would probably be found that better results could be obtained by adjusting the spark by the ear and the feel of the engine.

M/C.

Some Despatch Riders.

Sir,—On the outbreak of the war I offered myself and machine for service either at home or abroad. I spent a lot of time in applying through various channels, but all in vain. Various reasons were given, among others, only 3½ h.p. machines were accepted for service, also the requisite number of motor cyclists had been obtained.

I have a pretty good working knowledge of the internal combustion engine, and I have a fast and reliable machine. Also I speak French fairly well. However, I am still one of the unemployed.

Now here comes the point. On no fewer than three occasions lately, and since Monday, 21st ult., I have had to assist Government and military motor cyclists. The first was a rider of a Triumph—a soldier. When I discovered him he was occupied in a futile endeavour to separate his valve cap from the sparking plug with an undersized King Dick. On enquiry, I elicited the fact that that constituted his entire tool kit! *Mirabile dictu!* Add to this the fact that I had his engine running in under three minutes without doing anything more than flooding the carburetter and pedalling in low gear and you will get an idea of the rider's fitness for his job.

No. 2 happened on September 22nd—a yeoman this time, in trouble with his throttle wire. No. 3 called upon me the following afternoon, having come four miles on a push bicycle to borrow a valve for his B.S.A. or a lift to his destination on Salisbury Plain. He was a despatch rider employed by the War Office, and did not think it necessary to carry a spare exhaust valve.

Now, sir, I think the facts speak for themselves. It would appear as though the War Department accepted anybody who applied during the first day or so of the war regardless of their abilities or qualifications for the job. Would it not have been better if they had taken the advice of the A.C.U. as to the best machines and riders? I understand that some sort of offer was made the War Office by the A.C.U., but for some reason or other was not accepted.

FRANK MAY.

Cheap Petrol.

Sir,—Your leader *re* cheap petrol is very apposite at the present crisis of the motor trade, but there is another aspect of the matter which affects our whole industrial prosperity, namely, petrol as a motive power for stationary motors where no other power is available or practical. I am of the opinion that 90% benzole could be made and sold at 1s. per gallon, provided not less than ten gallon drums are ordered, and I need not tell you that 90% benzole is in every way equal to petrol. I would be prepared to form a small syndicate of owners on mutual lines, but I desire to prevent the speculative and mercenary element getting a hold of such a syndicate; then benzole at 1s. per gallon in ten gallon free drums would be a practical certainty, and our motor manufacturers would, no doubt, co-operate with us to keep things in the hands of honorary directors, managers, etc., for common good.

VIRIBUS UNITIS.

Sir,—I have read with great interest your article on cheap fuels, and there is no doubt that what you say is perfectly correct, and you will learn with gratification that the happy state of things to which you refer has just come into existence, and a really first-class spirit is now available at 10½d. per gallon—1½d. less than the price you outlined. If motorists go about it the right way there is no need for them to use any other, as the results obtained from this new spirit are in every way equal to those obtained from the finest petrol. In my opinion, this new spirit is altogether superior to benzole, as it is perfectly clean, and makes no smoke.

One slight disadvantage with it is that the motor will not start on it when stone cold, and it is necessary to inject a little petrol into the induction pipe, and immediately the engine has fired a few times it will run right away on the new spirit. A better way, no doubt, is to have a very small torpedo tank holding one gill of petrol fixed on the top tube with a three-way tap attached, and all you have to do is to turn the petrol in the small tank into the carburetter, and immediately the engine has started turn the tap the other way so as to communicate with the main tank. My experts tell me that it is impossible to tell whether you are running on the best petrol or the new spirit. It is as well to have it understood at once that this spirit is not connected in any way with paraffin, and I am told there are millions of gallons available. Of course, the war will seriously interfere with the supply of this spirit, but there are very considerable stocks of it in this country which are available for immediate use. The way to go about it is to order a forty-gallon barrel from your agent, and keep this in your garden or yard and draw it off as required. I am also informed that, owing to its specific gravity, it does not come under the same regulations as petrol with regard to storage.

When the engine has once been started it can be stopped and will start again without using petrol within a quarter of an hour or even more.

The carburetters for using this spirit should be arranged so that there is a very violent suction past a pilot jet at low speeds, and with a carburetter of this sort the engine will tick over dead slow. The cost of a small torpedo tank with a three-way tap and pipe will be something about 10s., and can be fitted on the machine by anyone in ten minutes, and then you can run your machine at about half the cost of running on petrol. The chief trouble that I anticipate will be experienced with the makers of the machines, many of whom simply will not adopt anything new until it is forced on them by the public, as they claim that anything in the nature of an innovation upsets the routine of output. But there is little doubt that an invention which reduces the running cost 50% ought to need no talking about—the public will see to that—and that I am sure in a very short time a machine that is not arranged for using cheap fuels will be unsaleable, as no motor cyclist who is in his senses will run on a fuel at 1s. 6d. when he can run as well for 10d. or 11d.

CHAS. BINKS.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Designing a Two-stroke Engine.

I am designing a multiple cylinder two-stroke engine, and before taking out a patent I wish to become conversant with the latest designs of this type, to prevent me infringing any other patents. I also wish for some information regarding proportions of ports and working parts, as I have had no experience in the work. Will you please recommend any books, which will cover the subjects?—P.L.C.

Owing to the extraordinarily rapid development of two-stroke engines, we are afraid that we cannot recommend you a book which covers anything like all the ground. Many designs have been described in detail in this journal during the last year or so. We should advise you to get a patent agent to make a proper search amongst the records of the Patent Office; he will then be able to tell you whether your ideas have been anticipated or not.

Petrol Jet Choked.

My machine is a 6 h.p. 1913 twin-cylinder. I have run the machine since last November without any trouble, but lately it has begun to go wrong. The engine suddenly pulls up with a jerk and then starts again, as if the jet had become stopped up and then suddenly freed itself. This continues until it finally stops. If I close the air lever, I can get the engine to run all right for a time, but the longer I run the less air it takes, until it will not run at all. I then take down the carburetter, and find it all right, the jet being quite clear and the petrol flowing freely into the float chamber. On putting it back without altering it, the engine will run perfectly for ten, twenty, thirty, or sometimes fifty miles, but sometimes it will not run for above a few minutes. I have tried the plugs, and find they will spark all right. I have also tried different levels of petrol in the float chamber.—J.C.B.

The trouble is undoubtedly due to a stoppage in the air vent or in the petrol pipe, or possibly to the presence of water. The symptoms referred to in your letter do not admit of any other explanation. Possibly there is an obstruction floating in the tank, which occasionally stops the petrol pipe orifice, or possibly the needle valve sticks and cuts off the petrol supply.

Consumption on Two-stroke.

I have a 2 h.p. two-stroke, and am troubled with mysterious back firing when the throttle opening is reduced, and would be very much indebted to you if you can enlighten me with your experience. It is not the ordinary crank case blow back, *viâ* the transfer port and inlet, but a decided metallic knock back which rings right through to the flywheel. I have cleaned out cylinder, ports, and exhaust pipe perfectly, and the only thing I am at present inclined to condemn is the magneto, on the grounds of double sparking. It is timed dead on top when retarded. You may be interested to hear that with the most careful driving I can only get about fifty-four miles to the gallon, and that with the smallest jet on which it is possible to run the engine.—E.A.H.

Your trouble sounds as though it were caused through weak mixture, due to too small a jet or choked passages, but if you are absolutely certain that it is not a blow back we should be inclined to suspect the plug. As you have probably discovered, the plug on a two-stroke gets extremely hot, and we should advise a single-point plug with a heavy electrode. Your remarks *re* petrol consumption at the end of your note are interesting, for with a very similar type of motor cycle we have personally succeeded in getting approximately seventy miles to the gallon—to be exact sixty-eight and a half—and this with a medium jet and the machine being driven with no idea of consumption. Examine the tank and petrol pipes for leakage, and test freeness of hub bearings.

A Dog Owner's Liability.

When riding a motor cycle along a country lane a month ago a dog rushed out of a cottage gate, and ran under the front wheel of the machine, causing a skid. I fell under the machine, sustaining a fractured foot. I am told this dog has a habit of rushing out at cyclists and others when passing. The accident occurred half an hour after sunset. Is the owner of the dog in any way liable for damage?—G.W.C.

If you can prove that the dog is in the habit of attacking riders, and that the owner himself knew of this propensity, you have undoubtedly got a good legal case against him, but, unless you are in a position to prove this, we fear that you have no remedy. It sounds very unfair, but that is the present position of the law, and you have our sincere sympathy in the matter.

ALL ABOARD.

A happy family in an Ariel sidecar on the sands at Dymchurch, Kent.

Legal Formalities Before Riding.

Possibly you will think my questions rather trivial, but doubtless there are other novices like myself just about to become riders, who may also profit by your remarks. I want you to tell me exactly what I must do to comply with the law on taking over my machine.—NEW RIDER.

First of all you must go to the nearest county or borough police station and get the authorities to give you a registration number which costs you 5s. This number you must have placed on the machine in front and at the rear. You must then get a driving licence at the same place. This costs you another 5s., and is valid for twelve months from the date of issue. You must then go to the nearest post office and pay the annual revenue tax of 20s., valid to December 31st of the same year. If you register the machine after October 1st the revenue tax is 10s. for the rest of the year. You are then free to ride your new purchase.

Effect of Benzole on the Jet.

I have this year taken to running my motor cycle on benzole. I find the advantages are that the engine does not knock and that carbon deposit is soft, and thus can easily be removed. But I find one serious drawback, and that is that after a few hundred miles' running the jet becomes completely clogged up. Once or twice I have been able to clean out the jet without damaging it, but on two occasions it has been so clogged that I have spoiled the jet in trying to free it, and have had to get a new one. Can you throw any light on this?—JETTE.

It is difficult to say what can have caused the obstruction you mention. It sounds a case for a chemist to investigate. We ourselves have run thousands of miles on various brands of benzole with different carburetters, but have never experienced a like happening. Benzole rapidly discolours the jet and turns it black, but nothing worse. We advise you to take a sample of the spirit you use to an analytical chemist and show him the jet when clogged, and doubtless he will find a reason for the trouble.

Liverpool to Bristol.

Will you kindly advise me as to the best route from Liverpool to Bristol? As this is my first long ride I would like to keep to the main road as much as possible and avoid bad hills. Perhaps you would also tell me the distance?—V.M.

This is quite one of the nicest day's runs you could plan. Nearly all the way the route lies over excellent roads, and most of it is through charming scenery. Care should be exercised in passing through Shrewsbury. Leave Liverpool by the Birkenhead ferry, and then go through Chester, Whitchurch, Shrewsbury, Craven Arms, Ludlow, Leominster, Hereford, Monmouth, Chepstow, Severn Tunnel Junction, where you take a train to Pilning, and thence on to Bristol. The distance is a little under 150 miles.

Timing a Four-cylinder F.N.

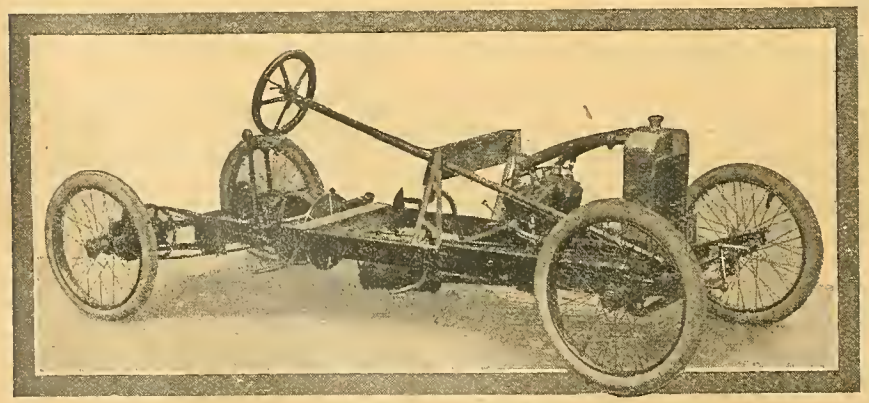
Will you kindly give me a few hints with regard to the timing of the magneto of a four-cylinder F.N.? Mine is a 1909 model, which I recently bought second-hand, and I had to remove the magneto and the distributer for some repairs a short while ago and am at a loss to know how to proceed in the timing. Should the gear or cogwheel on the engine shaft or magneto shaft be detached? In which case it will not be easy to put them back in position, as these gear wheels lie between the magneto and the engine and are not accessible.—J.R.G. (Jamalpur, Bengal).

Turn the crankshaft until the piston of the back cylinder is five to six millimetres from the top of the compression stroke. Unless the slide holder has been altered, the carbon brush of same will point to the position of the bottom right hand terminal of distributer, assuming the latter is in position. Now grasp the contact breaker of magneto and turn it until maximum resistance is felt, and slide the magneto gear wheel into engagement with the corresponding wheel on the crankshaft of the engine. Having bolted the magneto and fitted on distributer, verify the timing. The points of the contact breaker should commence to part when the piston is in the aforementioned position, or any other piston for that matter. The wiring of the distributer in relation to the respective cylinders is bottom right wire to back cylinder. Top right wire to third cylinder from back (or second from front). Bottom left wire second cylinder from back. Top right wire front cylinder. The lengths of the wire will, in themselves, show to which cylinders they go.

Remagnetising a Magneto.

I should be much obliged if you would advise me how to remagnetise the magneto of a 1911 twin machine, the spark being weak. Being an electrician, I should like to do this work myself for the experience.—J.B.

The question you ask us is rather out of our province. Roughly, the magnets are arranged across the pole pieces of the dynamo and intermittent shocks are given. These instructions are, of course, too vague for you to work to, and we should advise you to consult some standard work on the subject if you still desire to carry out the work yourself, but we should be inclined to advise you to return the magneto to the manufacturer or to some first-class magneto company, as it frequently happens that a weak spark is not due to demagnetisation. If the magnets were first-class when new, it is extremely improbable that they will have lost their power unless they have been improperly handled.



CHASSIS OF THE D'ULTRA CYCLE CAR.

This car, which was described on page 346 in our issue of September 17th, has a V type water-cooled engine, and friction gear and final drive by a single chain.

READERS' REPLIES.

A Mysterious Complaint.

It may prove of interest to know that I had exactly the same symptoms, mentioned by your correspondent in the issue of August 27th, with the exception of the "popping" in the carburetter, in my single-cylinder Zenith, and I went through exactly the same procedure as your interrogator. I eventually proved it, without a shadow of doubt, to be due merely to a choked silencer. When this had been cleared the machine ran well.—J. P. BURTON.

More Speed Required.

In re your issue of September 17th on page 358 under the above heading, I should like to make a suggestion. If your correspondent refers to an early three-speed Triumph motor cycle it is highly probable that the clutch mechanism is slighty at fault. I had similar trouble with my early 1913 machine owing to the clutch not being quite "free." This was obviated by filing away a portion of the footrest socket and under side of clutch pedal to allow the pedal to stand further back when the clutch is in. I found this gave the clutch a "freer" movement.—A.P.

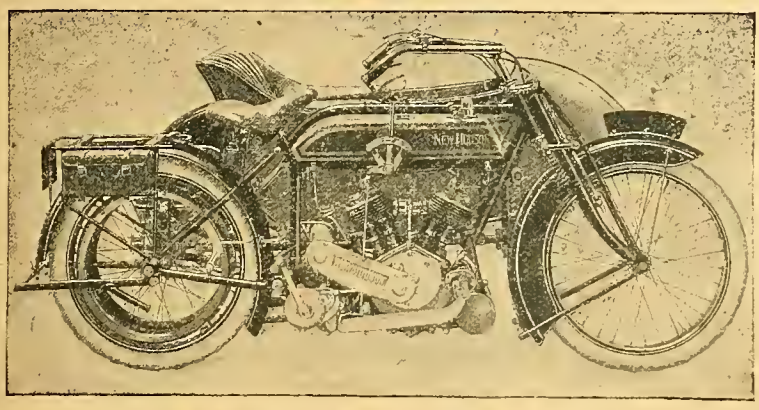
EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"W.P." (Northleach).—Chain-driven Levis. Speed and power on hills.

"H.D." (Tregony). — Humberette (water-cooled). Ease of starting, springing, cooling, and petrol consumption.

"R.J.P." (Belfast).—Reliability, durability, and petrol consumption of 2½ h.p. two-stroke New Ryder or Levis compared with Douglas 2¾ h.p.



"The Big Six"

The Big Six Passenger Combination — a machine of super efficiency that ensures Perfect Service and Absolute Satisfaction under the most strenuous conditions of service. Provides all the pleasure, comfort, and convenience of a car.

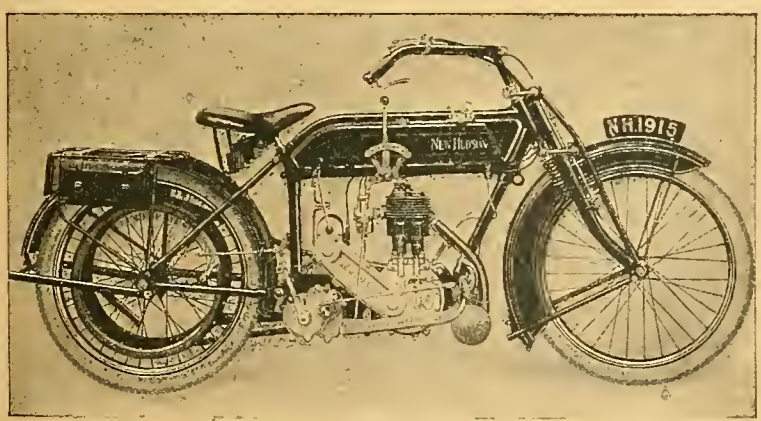
PRICE, complete with De Luxe Coachbuilt Sidecar, **£88 - 4 - 0** Solo Model, **£75 - 12 - 0**

NEW-HUDSON

The Military Service Model. Specially built for Serviceability, Efficiency, and Reliability. It is pre-eminently the machine for military requirements.

New-Hudson 3½-4 h.p. Engine with Countershaft Gear of Motor Car Type (3-speeds). High-grade equipment. Service grey finish. PRICE **£57 - 10 - 0** net.

The Service Model.



THE NEW HUDSON CYCLE LIMITED BIRMINGHAM

THE New-Hudson 2 STROKE 2 Lightweights

in four distinct and popular priced models, covering the widest range of usefulness at a low cost.

Model A. 2¼ h.p. 2-Stroke Engine, Low Built Frame, New-Hudson Druid Forks, Dunlop Tyres, Lycett's Saddle, etc., etc.

Price **£27 - 5 - 0** net.

Model C, with Countershaft 2-speed Gear,

Price **£33 - 0 - 0**

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. ooo, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Son; Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

YES! GO TO GODFREY'S.

15, Nicholas Street, Coventry.
21st September, 1914.

To Messrs. Godfrey's Ltd.,

Dear Sirs,

With reference to the 1909 Triumph I purchased from you in March, I feel I must write and say how pleased I am with the machine, having now ridden it well over 4,000 miles, including several runs of 140 miles practically non-stop, and during the whole of the time I have had absolutely no trouble whatever except tyre trouble.

Whenever a friend asks me if I know where there is a good second-hand machine for sale, I always say—Yes, go to Godfrey's, they'll fix you up.

With best wishes for your success, and thanking you for the way in which you sent my machine out,

I am, yours truly,
F. N. TAYLOR.

We take stock at the end of this month and are offering substantial discounts off our list prices to cash buyers.

CHATER-LEA Tricar, 4½h.p., mag., 2 speeds, for motor cycle; sell £15, or nearest.—Smith, Hare Hill, Ottershaw. [7449

CANOE Front Sidecar Body, B.B. carburetter, for tyres, 26×2¼, or speedometer.—Write, 54, Connop Rd., Enfield Wash. [7353

1912 8h.p. Chater-Lea-Jap, sidecar, clutch, kick starter, Indian or lower power.—363, Shaw Rd., Royton, Lancashire. [X0320

3¼h.p. Quadrant, new tyre, mag., spring forks, B. and B., Dunlop, for organ, auto cycle, £12, or anything.—3, Bolton Rd., Bury. [X0338

EXCHANGES Wanted against shop-soiled 1914 Rex-Jap, Williamson, and Sun-Villiers machines.—Meter Exchange, Westgate, Halifax. [0446

EXCHANGE 3½h.p. 1912 3-speed Singer, excellent condition, coachbuilt sidecar, for higher power, or cycle car.—Norton, Empire, Aberdare. [7409

EXCHANGE 1914 Bradbury, coach sidecar, whole-plate camera, and cash, for recent 6h.p. J.A.P., A.J.S., or Matchless.—Feather, Cowper Av., Clitheroe. [X0146

EXCHANGE 1914 7h.p. Indian motor cycle and coachbuilt sidecar, electric lamps and horn, and wind screen, cost £88 May, for modern light car, Hillman or Singer preferred.—Garr, North Hykeham, Lincoln. [X0188

WANTED 2-stroke lightweight, or 3½h.p. sole machine and cash, in exchange for 8h.p. Bat-Jap sidecar combination, 2 speeds, free engine, kick starter, fully equipped.—Offers to A. Sealey, 88, Princes Av., Watford. [7476

MORGAN wanted; exchange 1913 Indian and sidecar, engine overhauled at works, electric lights, back-rest, spare tyre, tube, paint as new, splendid condition, or sell.—Box L6,178, *The Motor Cycle* Offices, 20, Tudor St., E.C. [7388

REPAIRERS.

ANTOINE Cylinders, pistons, and parts; prompt delivery.

CYLINDERS, crank cases welded; quotations free.

COMPRESSION Cylinders ground and new piston fitted, 24/-.

OLDEST Engines restored to highest vitality.

COMPLETE Overhauls at lowest possible prices. Full stock of Rex, Triumph, and J.A.P. parts.

COUNTER-SHAFT Gears.—We can now quote the trade for our Rex-J.A.P. 3-speed gear at inclusive prices, including fitting to old machines.—The Premier Motor Co., Ltd., Aston Rd., Birmingham. [0246

MORGAN and Maxwell, Streatham, for cheap, good repairs. [X0351

VALVES.—Nickel steel valves, any size, 3/6; per pair 6/-.—C. R. Foster, Kirkstall Rd., Leeds. [0253

BRADBURY Spare and Repairs a speciality.—Agents, Bright and Hayles, Church St., Camberwell. [7528

WELDINGS, Ltd., Dept. M.C., 235, Gt. Ancoats St., Manchester.—Oxy-acetylene welding experts.

BROKEN Flanges, valve seats, pistons, crank cases, water jackets, welded and machined complete.

SEND Your Old Engine or complete machine for overhauling, re-bushing, cylinders re-ground, new pistons, rings, and gudgeon pins fitted.—Weldings, Ltd., Dept. M.C., Manchester. [6234

CYLINDERS, Crank Cases welded; quotations free; send your enquiries.—Premier Motor Co., Aston Rd., Birmingham. [0248

2/6 genuine nickel steel valves; guaranteed unbreakable valves, 3/6.—Whitehead, Rugby Rd., New Cubbington. [X0261

OXY-ACETYLENE Welding, first-class work; moderate quotations.—Purcelle, 78, Charlotte St., Tottenham Court Rd., W. [6750

CRACKED Cylinders, castings, forgings, etc., successfully repaired by Len's metallurgical process.—Lea, Engineers, Runcorn. [5197

WELDING.—All metals, cylinders, and crank cases. We have the plant, experience, and method for every job. Quick delivery.—Below.

CYLINDERS Re-ground, new pistons fitted, complete with rings, etc.; 22/6.—Oxy-Acetylene Welding, 349, Lillie Rd., Fulham. 'Phone: Hammersmith 1617. [6430

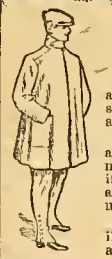
OVERALLS MADE BY A PRACTICAL RIDER



THE MAN WHO RIDES KNOWS WHAT IS WANTED.

I have over 10 years experience as a rider in all weathers, and I have gradually perfected a suit of overalls to meet my own requirements as a travel'er.

The business rider needs to keep smart—dry and comfortable. Whether you ride for business or pleasure, these conditions are essential if you are to enjoy your riding. Don't throw away your money on things that are absolutely useless for your purpose.

I have explained all about this subject in an illustrated booklet. You'll be interested—send a post card for it to-day to J. SMITH.

MOSLEY & SMITH

Standardisation of Controls.

WE have consistently urged the desirability of standardising the controls of motor cycles, and have devoted a considerable amount of space in the hope of interesting manufacturers in the subject. A leaderette on the need for standardised controls appeared in these columns on April 2nd, and at that time we took the opportunity of drawing the attention of the Motor Cycle Manufacturers' Union and the Auto Cycle Union to this important matter, soliciting their support in our campaign. Though we have reason to believe that a goodly section agreed with our reasoning and the advisability of making the controls of all the different makes of motor cycles as far as possible the same in order to avoid the possibility of accident, we feel that the subject was not considered so seriously as it should have been, and with certain members showing only a lukewarm interest in the matter we are afraid that very little progress has been made.

A correspondent last week in our "Letters" columns emerged from an accident more luckily than a great many others have done in like circumstances. We have already recorded one or two fatal accidents due to motor cyclists changing from one make of machine to another, and being accustomed to the working of the levers, discovered only too late that the new machine on which they were mounted accelerated speed when they intended a directly opposite result. A good many may reason that a man should become acquainted with the controls of any machine before attempting to ride it. Quite true, but a rider may be perfectly well aware of the fact that the strange machine on which he is mounted is controlled differently from his own mount, and yet in an emergency do the wrong thing. With swift moving machines one has very little time to think what to do in a tight corner, and one is led to control a car or motor cycle automatically.

We are led to make this further appeal now that new models are in the air, and we would recall to manufacturers that, after persistent pegging away, rims are nowadays standardised. This was done for motor cycles purely for convenience; standardising the working of control levers would not only be conducive to convenience, but to safety as well.

Progress in Gear Design.

IN surveying the possibilities of the future, particularly with regard to change-speed gears, it is becoming increasingly evident that a multiplication of ratios will be the rule in 1915. This fact can be almost wholly credited to the Tourist Trophy Races and Six Days Trials, and it might be well at this juncture to quote a reference to the subject of gears made in these columns when reviewing the results of the Junior and Senior T.T. Races held last May. The prophecy we then made was that in view of a practically infinitely variable gear having won the Senior race and a four-speed mount having won the Junior event, a general increase in gear ratios would be the future order. Already we hear of three different makes of four-speed gears which will be marketed next year, and, moreover, quite a number of firms who have hitherto pinned their faith to the two-speed gear will shortly change over to a box with three speeds.

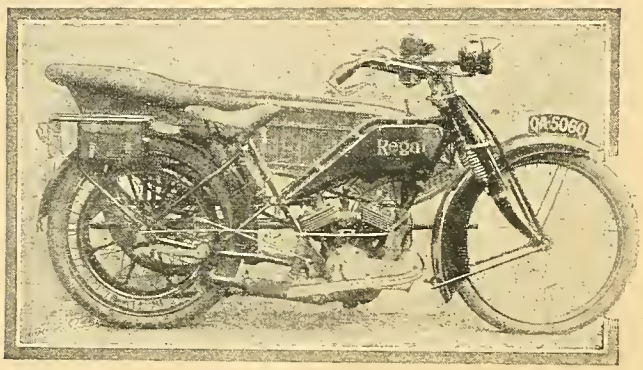
The Motor Cycle has never lost an opportunity of urging the desirability of at least three speeds on a motor cycle. It is obvious to even inexperienced riders that with a machine possessed of only two gears there must be frequent occasions when the low gear is too low for any particular hill, and yet the top gear too high for that same gradient. But, in providing the intermediate ratio, this is not all the good which accrues, for with three speeds one may distribute the ratios with advantage over a wider range; that is, the top gear may be made higher and low gear lower, thus easing the work required of an engine.

With Motor Cycles on Mendip.

AN ACCOUNT OF AN INTERESTING DAY'S JAUNT OVER HISTORIC GROUND.

IT was a fine breezy morning when, mounted on 2¾ h.p. two-speed A.J.S. motor cycles, we left Bristol and shook its grime from our wheels over the bumpy road through Knowle. We were glad to see the green fields and sparkling river as we ran down the charming valley of the Chew, past Stanton Drew with its Druidical circles, and into Chew Magna, and then to get a glimpse of half the Mendips as we sped onwards towards the Harptrees.

Soon we were climbing, and the sharp ascent and the bad bend on Harptree Hill brought us both to low gear, but before gaining the top we had got into high gear again. Here, at the Castle of Comfort Inn, a



The twin-cylinder Regal-Precision machine for ladies' use. The engine is a 4 h.p. with side-by-side mechanically operated valves, and a three-speed hub gear is fitted.

lonely house midst moorlike country, we made the first halt, and leaving the cycles walked back along the road, and, mounting a gate, searched successfully and found the object of the stop. This was the peculiar swallet hole, fringed with fir trees, and known on Mendip as the Devil's Punchbowl. But we saw nothing of his majesty, and returning to the inn remounted and hummed along the open road a thousand feet above the sea. It was good to be alive on such a morning, and our thoughts were many and varied as we slipped past the ruins of Roman lead mines, which were here worked in days of long ago.

"Mendip's Sunless Caves."

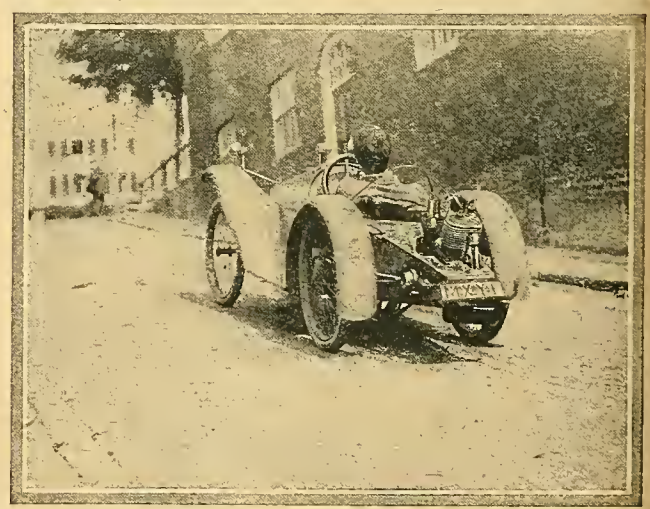
On we rode past Charterhouse, with its neighbouring amphitheatre, and rough, wild surroundings, all calling to mind the adventures of John Winterhead in "Two Men o' Mendip." Now we left the breezy upland and were soon descending the famous Gorge into Cheddar; we halted at the "Cliff," and after visiting the caves and admiring their wonders, we partook of excellent fare in the secluded grounds and watched the sunlit waterfall tumbling from the lake above, which, fed by the underground rivers of Mendip, is always clear and fresh. We could hardly tear ourselves away from such a scene, but the road was not to be denied, and onwards we sped towards Wells, but before reaching that cathedral city we bore sharp left and slowly ran into Wookey. Here we explored Wookey Hole, a series of huge caverns running back into Mendip, and famous for an underground stream, the source of the River Axe. Leaving the cave we walked on to Ebbor Rocks, another of Mendip's remarkable chasms, and after rambling through the Gorge and clambering over the huge boulders we returned to the cycles and jogged into Wells, and thence continued the journey to Glastonbury, an old-time town famous for its abbey and Saxon memories. The ancient hostelry and Pilgrims' Inn, now called "The George," claimed us a while, but we were restless and proceeded on foot to the top of the Tor, and had all King's Sedgmoor spread before us, its flats stretching for miles across to the Severn sea, which shimmered in the hazy distance. We could even see the North Hill at Minehead, and the Welsh coast beyond, but after a while we regained the hotel, and once more mounting rode across the flats towards Somerton, and into Langport.

King Alfred and the Cakes.

Here we were on historic ground, for, close by, in days of yore Alfred burnt the cakes, and later, and not far removed from our road, the last battle on English soil was fought. The ride was highly interesting, for the road now ran through sheltered hamlets, up narrow and tortuous lanes, and then down on to the flats again.

The road had nearly taken us into Bridgwater, but not wishing to enter this town we kept to the right, and presently got into Wedmore, famed for its associations with Alfred's victory over the Danes. Cheddar was now in sight, but we left it on our right, and, mounting rapidly, soon ran into Shipham, a scattered village once connected with a revival of the old mines, and renowned for its rough miners.

Crossing the Roman road which at one time ran from the top of Mendip to the sea, and speeding down through Churchill rocks, surmounted by Dolebury's ancient camp, we went quickly through Langford and up the sharp rise of Redhill, and running down over Barrow with its gleaming reservoirs of Bristol's water supply, regained Bristol after a ride of some eighty miles. A.S.R.



The Carden monocar surmounting a severe gradient leading up to The Terrace, Richmond. (See opposite page.)

THE CARDEN MONOCAR.

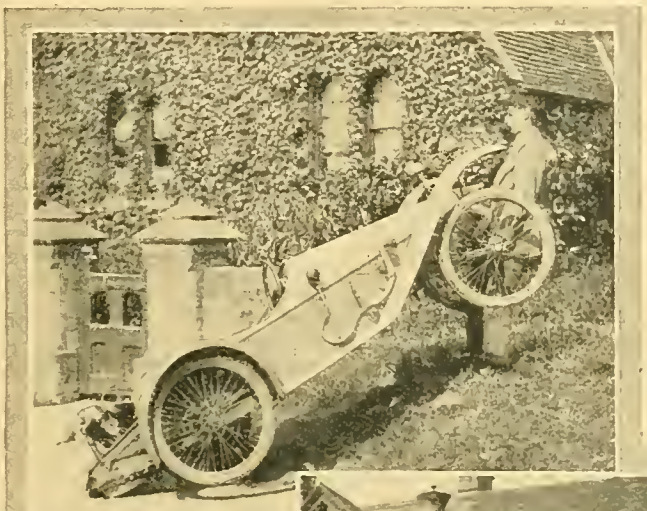
An Unconventional Machine which Possesses many Attractive Features.

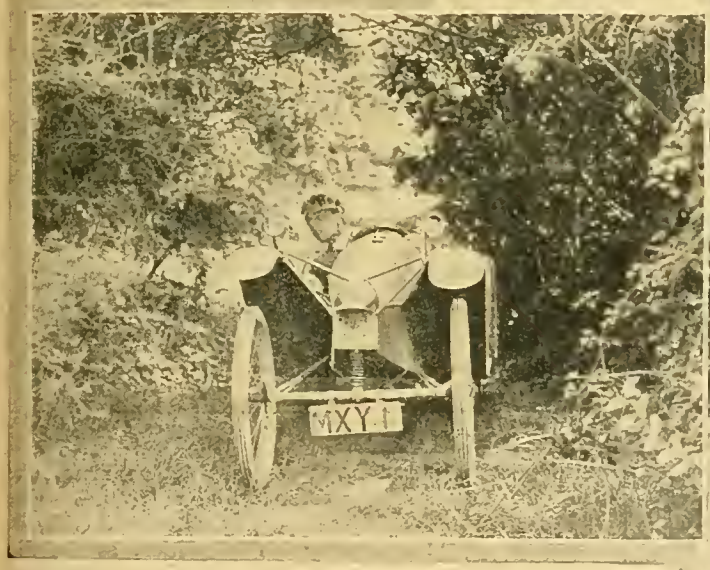
WE have recently had placed at our disposal a neat little single-seated cycle car known as the Carden and manufactured by the Carden Engineering Co., Ltd., Somerset Road, Teddington. The power unit is a V-twin J.A.P. and is rated at 5 h.p. We have covered a considerable number of miles and have found no difficulty whatever in surmounting comparatively severe gradients; although this model is only fitted with a single gear, but provided with an excellent clutch.

Possibilities for Military Use.

Owing to the present crisis one naturally thinks of the adaptability of various motor vehicles for field purposes, and we cannot help thinking that this particular runabout would be most suitable for such work. To begin with, it is extremely light and can be driven into all sorts of places and thus easily hidden out of sight, or it can be transported with ease on the rear of a transport waggon, and is, of course, light on the tyres and economical with petrol.

The Carden monocar can be lifted with ease, and dragged over comparatively large boulders.





An illustration of the utility of the Carden monocar on wooded land.

Its low position would help to keep it out of sight if the hedges of the lane are somewhat low—in fact, it is better in this respect than a motor cycle.

Although the roads were greasy, we did not notice any tendency to skid. This is an especially good feature, as riding at night on very bad roads is extremely difficult if an unsuitable vehicle is utilised.

The vehicle would, of course, be more flexible if fitted with a variable gear, and this is done on other models.

The footboards are capable of holding a fair amount of baggage, which can be strapped firmly in position. At the same time no extra wind resistance is caused, as the mudguards prevent this from being the case.

A series of tests were carried out in the neighbourhood of Richmond and Teddington, and the little vehicle was driven into some woods and through what was practically undergrowth with great success. For ordinary solo touring work it is very enjoyable. Altogether the

At Twickenham. This illustration gives some idea of its dimensions.

5 h.p. Carden impressed the writer as a reliable sporting machine, and, if it were fitted with a change-speed device, as a most handy little vehicle for those who require economy, comfort, and speed.

High Speeds in Australia.

An Unfortunate Accident Mars a Twenty-five Miles Victoria M.C.C. Road Race.

ON August 15th the Victoria M.C.C. held a twenty-five mile road race in the form of an "Out and Home" race between Cragieburn and Wallace on the outskirts of Melbourne, when record speeds for Australian motor cycle racing were established by Eric Tyler, who finished first on a 7 h.p. Indian in 23m. 55⅕s., the average speed being sixty-three miles per hour. The race was run as a handicap and twenty started, the limit man being C. Kelynack (2¾ h.p. Sunbeam), who was allowed 4½m. start. R. E. Dowel (8 h.p. J.A.P.), E. Tyler (7 h.p. Indian), J. Booth (7 h.p. Indian), and H. Jenkins (7 h.p. Indian) were the scratch men. Probably the fastest machine in the race was Dowel's J.A.P., but unfortunately this rider was involved in a most serious smash. This occurred through the risky method of running the race; owing to the "out and home" nature of the contest, the competitors occasionally met each other at high speed.

A Serious Accident.

Dowel and Booth had arrived at the turn at about the same time, and rapidly gaining on some riders in front were soon in their dust, and when travelling at a speed of about sixty-five miles an hour met a rider named Thornton travelling in the opposite direction. Their handle-bars locked, with the result that the riders were thrown with terrific force, both of them being flung ten or twelve yards away by the force of the collision. The two machines remained locked for an instant, and Booth, who was following, was in great danger of becoming sandwiched between them, but luckily in the nick of time the machines opened out and he got through. However, expecting a severe smash he tried to jump off his machine, with the result that he turned a complete somersault, pitching on his head. Luckily he was wearing a padded safety helmet, which saved his life, though, of course, he suffered from severe shock, and he and Dowel and Thornton had to be removed to hospital.

Tyler (7 h.p. Indian), the ultimate winner, rode splendidly throughout, and won by about a mile and a quarter from Jenkins, while close behind was Parsons (3½ h.p. Precision), who finished third with 2m 30s. start. His Precision was easily the fastest of the single-cylinder machines, and as this was his first race his performance was remarkably good. The final results were:

		m.	s.
1.	E. Tyler (7 h.p. Indian), scratch	23	55⅕
2.	H. Jenkins (7 h.p. Indian), scratch	25	3⅖
3.	H. Parsons (3½ h.p. Precision), 2m. 30s. start	28	0

Eric Tyler (7 h.p. Indian), winner of the Victoria M.C.C. twenty-five mile road race from Cragieburn to Wallace and back.

PRESSED STEEL SIDECAR CHASSIS.

WHEN one considers the wonderful advance during recent years in pressed steel work it seems extraordinary that so few attempts have been made to construct sidecar chassis of this material. In the early days of motoring, nearly every car was constructed with some form of tubular frame, but tubes gave place to armoured wood and pressed steel, till nowadays it is hard to find a tubular frame.

The advantages of the pressed steel sidecar chassis are obvious, it can be made light and cheap, and there is no need for brazing.

Lightness and strength may be combined, as the various members may be so shaped as to give strength where strength is needed, whereas in the tubular construction the strain often comes on some almost unsupported spot with the result that a fracture occurs after strenuous road work. Cheapness can only be obtained by manufacturing in quantities, as the dies would be expensive, but the big sidecar manufacturers would find a distinct saving.

The advantages of having no brazed joints are chiefly that there is no fear of burnt tubes or poor brazing. Provision for petrol cans, luggage, and tyres would be easily provided, and the side members would form an excellent base for the spring fixings.

The lugs for the connections could be riveted firmly to the frame, and there would be no fear of their twisting out of line and becoming difficult to attach.

OCCASIONAL COMMENTS

BY "IXION"

Dissolved Acetylene.

"Nocarbide" may be right in implying that very few D.A. cylinders contain the six cubic feet of gas with which their makers credit them, but he should verify the capacity of his burner before rushing into print. Burner sizes are determined by the quantity of gas they pass in an hour, and the average motor cycle head light is equipped with a "¼ft." burner, *i.e.*, a burner which passes a quarter of one cubic foot of gas in sixty minutes. I have only verified the contents of one cylinder in actual use during this year; I exhausted this on my cycle car, feeding its contents to a pair of ¼ft. burner head lamps, and it lasted well over eleven hours, as against the twelve hours for which six cubic feet should suffice two burners of this size. But I have tested all my other cylinders against a good gauge, and they have all registered six cubic feet when delivered, and their charges have been approximately correct, so far as rough estimates go. Some users turn on too much pressure, so that the burners flare and roar, when they will pass probably half a cubic foot per hour instead of a quarter of a foot. "Nocarbide" will find that a quarter foot burner will give all the light he requires for a motor bicycle, and if he gauges his cylinders on delivery, refusing any which do not show six cubic feet, he should obtain from twenty to twenty-four hours' light from each cylinder when using a single lamp.

The Accuracy of Speedometers.

The agents for the Jones speedometer take exception to my implied condemnation of certain speedometers which I did not name in a recent comment. They say that in a very lengthy and varied experience they have found that few complaints of inaccuracy have any foundation so far as the speedometer itself is concerned. Practically without exception they trace their few complaints to one of four causes, viz.:

(1.) Owner's misjudgment of speed.
(2.) Incorrect gear combinations.
(3.) Tyre changes.
(4.) Tyres being of less or greater actual diameter than the makers' nominal measurements.

These factors must obviously be taken into consideration. As a matter of fact, I can add a fifth factor. I was very dissatisfied with one of my Watford speedometers this summer. It possessed three moods: sometimes it would register in the steadiest "deadbeat" fashion—sometimes, without swinging over an appreciable arc of the dial, the needle would dither so violently that it became a vague blur instead of a black silhouette; sometimes it would swing over an arc of 30°. The whole cause was too sharp a bend in the driving shaft. I almost scrapped a six guinea A.T. instrument because its needle oscillated between 5 and 45 m.p.h., finally discovering that a gentler curving of the shaft produced the "deadbeat" which the makers claim. It is more than possible that speedometer makers are more sinned against than sinning.

"Petroil" Lubrication.

I wish some skilled scientific investigator would focus his faculties on the respective merits of "petroil" and drip feed lubrication, as applied to small two-stroke engines. I have used both methods for a fair distance during 1914, and so far as superficial road experience can detect, the following is a fair statement of their respective merits and defects. The "petroil" system (*i.e.*, oil is mingled with the petrol, and fed through the carburetter to the crank case) is fool-proof, and genuinely automatic. Under all riding conditions an approximately correct amount of oil is fed to the parts requiring lubrication, whether the driver be an expert or a dunce. These are high merits in any case; doubly so, when we reflect that most users of these machines are comparatively inexperienced. On the other hand, designers who aim at a clean crank case, urge that if the oil is fed direct to the bearings, without fouling the explosive mixture, more efficiency is obtained from the engine, and the process of carbonisation is lengthened. These, again, are real merits, and my experience bears out the claims. The smaller one's engine, the more desirable it is that full efficiency should be obtained. The less one loves tinkering, the longer should the job of cleaning out the engine be deferable. But I notice that the wee two-stroke engine is very sensitive to its lubrication. To get the best results, the drip feed needs constant resetting; if one coasts down a long grade, the normal oil feed is excessive, and the engine cannot consume the oil which drips into it. At the foot of such a coast, the engine will either smoke freely, so cancelling the theoretic advantage of slow carbonisation, or it may even "four-stroke" for a short distance. The ideal is obviously (if my conclusions are correct) an automatically variable drip feed to the bearings; but such a system is difficult to devise, and expensive to construct. On the whole, therefore, at present the "petroil" system seems the best. If it does not make for the highest engine efficiency, a two-speed gear can be employed to rule out the demerit. It demands no attention from the driver. If it hasten the day when the ports and cylinder require scraping, the spasmodic bouts of over-lubrication resulting from failure to reset a drip correctly in traffic and downhill probably render carbonisation at least as rapid as it is with the "petroil" system. Personally, I am able to go further without cleaning the engine on the drip system than I can on the "petroil"; but the happy-go-lucky owner probably soots up his engine equally fast with both systems.

A long line of members of the Napier Motor Cycle Club of New Zealand. Motor cyclists in the Antipodes are now enjoying their summer (and, incidentally, are keeping British factories busy). The photograph was taken on the occasion of the opening run.

Petrol at a Shilling a Gallon.

Some Suggestions for Encouraging a Supply of Home-made Fuel.

THE leader in *The Motor Cycle* of Sept. 24th decided the present writer to tender the results of some years' investigations toward the home production of motor spirit at a reasonable figure. At the outset it is safe to assume that imported petrol is most unlikely ever again to drop to a shilling per gallon, and commercial practices would, of course, tend to keep up the price of home products to near that of imports. However, the following deductions are offered with the object of inducing motorists to take a hand in the proposals made.

There are no mineral deposits in Britain that can be used profitably solely for the production of motor spirit. But there are immense quantities of materials that can be put to profit if all the products, or nearly so, are carefully separated and marketed. The cannel coals of Britain still have a wide distribution, and with the falling away of gasworks uses are out of demand. These coals vary from the bastard varieties with some 35% of volatile contents up to the true cannel with as high as 69% of volatile matter. and with the ash contents ranging from 2% to 40%. All these coals can be mined and treated on a paying basis. In Derbyshire, Notts., Yorks., Lancs., Wales, and Scotland rich beds of these coals are lying idle. Plants could be put down at the big towns of Manchester, Liverpool, Nottingham, Leicester, Leeds. Bolton, Wigan, Chesterfield, and Chester in England, and Edinburgh and Glasgow in Scotland, where petrol could be distributed at 1s. per gallon with a profit; the results being attained by working the coals for their maximum yields of liquid hydro-carbons, neglecting the residual coke and resulting gas.

Coal costs would vary from 10s. to 20s. per ton, and the crude oil yield from 40 to 100 gallons per ton. Striking a mean through the coal prices and oil fields, it may be taken that for 15s. per ton coal cost there would be a yield of 70 gallons of crude oil. On rectification the result would be: Motor spirit, 9 gallons; paraffin, 14 gallons; tar acid, 3 gallons; heavy fuel oil, 23 gallons; naphtha, 2 gallons; lubricating oil, 6 gallons; plus the residual pitch and wax, and less the waste. At prices for these liquid products of respectively 1s., 6d., 1s., 3d., 9d., and 6d. per gallon, the total is 29s. The capital and working costs of the plant according to its size have relative importance to the results from the paying point of view. A toy-sized plant would be useless, and a very big one, at first unwise; probably a 100 ton a day plant would be the best to begin with. Regarding the operations, the plant for gas take-off, cooling, scrubbing, washing, distilling, and cleaning is standardised, and made under guarantee by many makers. There are a variety of retorting methods in the field, not varying greatly in effects, and makers would tender for result. None of the means or apparatus are "in the air," only their suggested combination is undemonstrated. It is estimated that a 100 ton plant complete would cost £32,000, plus £4,000 working capital. Assuming 10% depreciation on the plant, and a nett inclusive working cost of 10s. per ton of material dealt with, plus coal cost of 15s. per ton, total 25s., against 29s. per ton income, the result is 4s. profit on each 25s. of outlay, or about 15%. With 300 yearly working days, the annual spirit output would be 270,000 gallons, and shares might be issued by the fair division of 75 gallons to each subscriber of £10.

Many may consider that this is not the time to broach this matter, but in the writer's opinion this is *the* time to get to work. W.W.S.

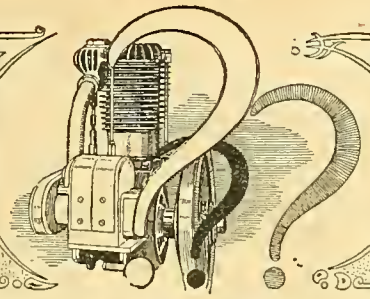
1915 MODELS AND "THE MOTOR CYCLE."

ANNUAL BUYERS' GUIDE IN NOVEMBER.

New models are now occupying the attention of manufacturers, and the pages of "The Motor Cycle" during the next month or two will be particularly interesting to motor cyclists and prospective riders. The earliest descriptions of new model motor cycles regularly appear in these columns; the accounts are penned by technical writers in interesting yet non-technical language, whilst sketches of mechanical details and photographs are a feature.

In November, a special Buyers' Guide issue of "The Motor Cycle" will be published, giving the specifications of all the leading 1915 models. This annual feature will prove more valuable this year than ever before in view of the manufacturers' decision not to hold a Show.

QUESTIONS AND REPLIES



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

More Braking Power Wanted.

I have an old motor cycle with a very small diameter band brake on the rear wheel. This brake is unlined, and is merely a metal strap round a metal drum. It generally slips freely for some little time after it is applied and then suddenly seizes and locks the wheel, which is most disconcerting. Unfortunately, the drum is an integral part of the wheel so it cannot very well be scrapped for a larger one. What course do you advise me to pursue?—M.W.

The only thing to be done is to have the brake drum lined with some patent fabric such as Raybestos or Ferodo. This cannot overheat and so cause locking of the wheel, and at the same time it possesses great gripping powers and long life. If the clearance between the band and the drum is not sufficient to allow the material to be fitted you must reconcile yourself to scrapping the band; but, as a matter of fact, this would not prove expensive, and you would never regret having done so.

How to Make a Running Mount.

I am just taking up motor cycling and would be glad if you would favour me with a detailed description of the "running mount" taken straight from the road. What special precautions should be observed, and what mishaps (if any) are likely to occur in mounting, and how can they be avoided? I am an experienced pedal cyclist, but have never mounted from the pedal, so I wish to mount the motor cycle direct from the road. My machine is a single-geared 3½ h.p., of medium weight, without starting device of any kind.—H.J.S.A.

A running mount is carried out in the following manner. The rider stands on the left-hand side of his machine. The air inlet is closed, the throttle a little way open, and the spark two-thirds advanced. He usually floods the carburetter slightly, and, holding up the exhaust valve lifter with the left hand, pushes the machine along at a brisk pace, and then as he puts one foot on the pedal he drops the exhaust valve and the engine fires. The more expert riders carry out the process in the same manner except that they do not mount by the footboards or pedals, but simply vault straight into the saddle at the first explosion of the engine.

Dissolved Acetylene.

Will you tell me what dissolved acetylene is, who are the manufacturers, and whether I require a special lamp for its use; also is it much dearer to use than carbide?—G.R.

Dissolved acetylene is acetylene gas highly compressed in a steel cylinder filled with a spongy substance and acetone. It can be obtained at most garages, and you can use it with any ordinary acetylene head lamp. Theoretically, it is slightly more expensive in use than acetylene; but, practically, we doubt if it is, because with it there is no waste, and, furthermore, no dirt to be cleaned. It produces a beautifully steady and powerful light. Its only drawback for solo motor cycle use is the slight difficulty of carrying the cylinder, which is rather heavy and cumbersome. Fitted along the top tube is probably the best position.

Too Weak a Mixture.

I am having a little trouble with my 3½ h.p. single-cylinder motor cycle. In running down a hill I find the engine only partly fires on the usual running mixture, explosions coming only about every ten or twelve yards very suddenly and then stopping altogether, whereas on the flat or the next up-hill it will fire evenly on the same mixture. Or in running at a high speed, thirty-five to forty miles per hour, it will only fire evenly for twenty or thirty yards, and then fire at intervals. Can you suggest a remedy?—A.W.

You have probably either got too small a jet in the carburetter or partial stoppage in the petrol pipe. You might make investigations in this quarter, as we feel sure that it is where the trouble lies. The engine fires regularly at ordinary speeds because the flow of petrol through the small jet is sufficient for the speed, but when you open the throttle on the level or run fast downhill the flow is insufficient, and the mixture is consequently too weak.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected matter will only be returned provided a stamped addressed envelope is enclosed for the purpose.

Wear of Driving Chains.

Can you tell me how much a chain can be allowed to stretch before it is scrapped? For instance, I have a driving chain which has stretched three-eighths of an inch in 3,000 miles, but is otherwise quite good. Also, I wish to purchase a tool for retacing valves, manufactured, I believe, by Lake and Elliot. It seems to me, from an illustration I have seen, that the cutting edge is set to a certain angle. Now, are all motor valves made to the same angle, and if not, can the tool be adjusted?—D.J.W.

The best test for the chain is to take it off and hold it straight out with the side plates of the links parallel with the ground. Then if there is very much sag in the chain you should scrap it. It is also very important to see that the chain wheels are not too much worn. The greatest amount of wear generally takes place on the small chain wheel on the engine. Most valves are made to the same angle. The particular tool in question can be adjusted; it is a most excellent little article.

Faulty Running.

I have a 2¼ h.p. Enfield twin-cylinder, with the running of which I am rather puzzled. The front cylinder gets nearly red hot, while the back one keeps at a moderate heat. The engine runs well on the stand, but not on the road. I have had the timing, magneto, carburetter, valves, and exhaust pipe overhauled. Could you give me any advice as to the cause?—F.O.

Your trouble is probably due to one of the two following causes, but it is impossible to say definitely without examination of the machine: (1.) The jet which supplies the front cylinder may be larger than the other, and the front cylinder may in consequence be getting too rich a mixture. The remedy is to stop up the jet groove with solder and cut a smaller groove in the solder with a penknife. (2.) The front cylinder may be getting too little oil, in which case it may be necessary to cut away part or the whole of the baffle-plate between the cylinder and crank case and bore some holes in the skirt of the piston. We presume that you drive with the spark well advanced; a retarded spark will quickly cause overheating, but it generally affects both cylinders.

Overheating Troubles.

I have a 4 h.p. single-cylinder 1913 machine, and when it has run about eight miles I have to stop two or three minutes for cooling, as my engine gets so hot that it will not take an incline. I drive with full air and about half-open throttle. Can you give me any suggestions that would get over this trouble?—P.N.

In all probability the piston is rather too tight a fit; if so it will improve with running. Be liberal with the oil, and use only first quality lubricant. After running three or four hundred miles take off the cylinder and clean off the carbon deposit, and continue rather to over-lubricate for some time further. It is also possible you are using too large a jet in the carburetter. Have you checked the clearance between the tappet and valve stem?

Automatic Valves Sticking.

I have an early horizontally opposed twin with a.o.i.v. Sometimes it starts quite easily and other times I have to run it a long way before it will fire, and then only one cylinder until it gets warm, but once it starts properly it will go almost anywhere. The carbon brushes are worn down rather short. Would that cause it, or do you think the jet is too small?—G.L.

If one of the carbon brushes is not making good contact it would account for the symptoms you describe. But we are more inclined to think that the trouble is due to the automatic inlet valve sticking in its guide in the cylinder which does not fire until the engine gets warm, when both operate properly. There is no reason to suppose that the jet is too small. With automatic inlet valves on a twin great care must be exercised to have both springs the same tension, and to see the valve stems are quite free in their guides.

Imperfect Carburation.

When running my 2¾ h.p. twin on the stand the engine will miss now and then, even when revolving fast with air lever closed, and on opening the air lever no change takes place till about a quarter open, when the "revs." drop off and the missing increases, the firing generally settling on one cylinder, but not always the same. When running on level on top gear fifteen miles per hour is the lowest speed obtainable without missing. If the speed falls below fifteen miles per hour and the air lever is closed somewhat, the pick up is accompanied by a series of misfires until about fifteen miles per hour is reached, and if the speed falls to ten miles per hour on top the engine may not pick up. The most annoying part is when starting up, for sometimes I have to push several yards before the engine will fire, even when hot. On dropping the exhaust valve it will push along as if there were no compression, or there were just explosion enough to overcome it, but there is no exhaust, then all at once it will fire. At ordinary speeds and on hills the machine is as good as usual. I have gone over almost everything such as valve and magneto adjustment, etc., but I have not adjusted the petrol level or removed the jet since I had the machine. The original valves are in use. I am using the new three-point water-proof Lodge plug.—H.S.

We should recommend you to see to the adjustment of the platinum points on the magneto, and also to take great care that there are no air leaks in the induction pipe unions or where the carburetter is attached to the inlet pipe. The carburetter may be badly adjusted for running slowly, but considerable improvement may be obtained by obviating the air leaks referred to. Look well to these points, and if you have no improvement try fitting another carburetter. This may sound very drastic, but in the end will probably be found advisable. The Amac, Binks, Claudel-Hobson, Longuemare, and B. and B. are all carburetters of the semi-automatic type, and any of these should effect an improvement.

Fine Castings and Noise.

Can you tell me if it is true that cylinders having deep and fine radiating fins are more prone to give out a metallic ringing noise when the machine is running than one with coarser cast fins? I am told the possession of such fine castings is the cause of the very distinctive "note" in the running of certain famous machines.—PUZZLED.

It is quite possible that there is something in the matter you mention. We have noticed that the noise of the fall of the valve head on its seating is often most pronounced on engines the cylinders of which are superfine castings. You may be interested to know that this particular ringing is unknown on engines with detachable heads—the copper and asbestos washers probably deadening the noise.

London to Leeds.

I should be glad of an answer to these two questions: The best route to Hunslet (near Leeds) from Marble Arch, W., missing traffic as much as possible, and the approximate distance? I have just purchased a 3½ h.p. motor cycle for solo work. What is the approximate distance I should get on a quart of lubricating oil?—G.W.

Make your way from Marble Arch down Old Quebec Street, take the first turning on the right, then turn left at the first square you come to, go straight ahead into Gloucester Place, continuing due north, leaving Lord's Cricket Ground on the left, go absolutely straight on, and at Barnet take the right-hand fork and follow the Great North Road as far as Doncaster—through Hatfield, Baldock, Biggleswade, Eaton Socon, Stilton, Stamford, Grantham, Newark, Tuxford, and Retford. After leaving Doncaster take the left-hand fork, skirting Pontefract, and keep to the main-road to Leeds, which will bring you to Hunslet. The distance is approximately 190 miles. A quart of lubricating oil should last you about 250 miles, perhaps more after the machine has been in use for some time; but it is almost impossible to give you any accurate idea of the oil consumption, as this varies according to the nature of the country in which you are driving.

Scene at the start of a Danish motor cycle competition. In the foreground is Miss Werner, mounted on a 2¾ h.p. Hobart.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"J.F." (Congleton).—Reliability, petrol and oil consumption of 3½ h.p. Douglas, Model B.

"J.M.H." (Barmouth).—Electric Indian. Reliability, consumption, speed over give and take roads, and wear of tyres.

"J.G." (Elgin).—Most suitable and economical combination for Highland roads. Combined weight of rider and passenger 23 stone.

A Despatch Rider's Adventures.

Corporal Howard Riddell photographed in hospital last Saturday.

WE had an interesting chat with Howard Riddell, the Birmingham motor cyclist who, we mentioned last week, was in the Northern General Hospital, Leicester, having been wounded in France. We were glad to find Riddell happy and fairly comfortable, the piece of shrapnel which pierced his side having been removed, and it is now only a question of time before the clot of blood which has formed may be removed. Riddell's experiences form interesting reading. He was among the first to volunteer his services as a despatch rider, and on Saturday, August 8th, at Chatham, was accepted for service, and in a single day found himself a corporal in the Royal Engineers with a revolver and ammunition in his possession, his 3½ h.p. single-cylinder Zenith-Precision (the same machine with which he still holds the one to six hour sidecar records, but with the substitution of an air-cooled cylinder for the Green) having been duly accepted and the official seal placed on it.

He was ordered to Southampton with five other despatch riders, all strangers to him, and, by a curious coincidence, crossed to Havre on the very same day he had intended crossing the Channel for the postponed Grand Prix Race. But more serious business was in store on this occasion, and Riddell and his friends had to put up with the discomforts of a cross-Channel trip in a collier low down in the water due to its heavy load of horses and cavalry, the crossing taking just twenty-six hours!

A Severe Test for Machines.

The party of despatch riders were first ordered to Amiens to work in conjunction with a signalling company, whose duty it was to keep up communications between the different generals and their divisions. But the trip north was not uneventful, for one or two of the party, possibly unaccustomed to speed work and keeping to the right side of the road, had to be extricated from ditches. Arrived at Amiens the valuable work the motor cyclists were able to perform, not only in despatch riding but in scouting work, drew forth praise from the commanding officers. The continuous speeding, however, tested the motor cycles to the limit. Riddell told us of an occasion when, in company with two colleagues, he was scouting in the district, when suddenly he heard a tremendous crash, and, looking round, saw a riderless motor cycle turning somersaults. The machine was badly damaged and an inspection revealed the fact that the driving chain had jumped the sprockets and locked the wheel (thought to be due to the spring link coming adrift), with the result that the rider was thrown and the back forks twisted round almost to right angles with the rest of the machine. A cart was commandeered on which rider and machine were returned to headquarters.

It was whilst scouting in the neighbourhood of St. Quentin and Landricies that Riddell first encountered German cavalry patrols, but neither side attempted the offensive but were content to report the presence of the enemy. Near Amiens he met and chatted with Georges Boillot, the Peugeot racing car driver, who is in charge of General Joffre's car.

One night at St. Quentin Riddell had to take an officer on the carrier of his Zenith to convey an order. It was known that next day the Allied Army had to retire, and on returning, the machine was put away, and Riddell snatched an hour or two's sleep. Next morning, when the general order to retire had been given, he discovered that the back wheel had a huge dent and four spokes broken as the result of striking a *caniveau* (a water gulley across the road frequently encountered in France) at speed with the officer on the carrier. There was nothing for it but to stay behind and remove the wheel, which was exciting work with the enemy in the vicinity. Riddell was lucky in finding a cycle agent, who fitted new spokes taken from a motor cycle he was about to leave behind in the shop.

Showing patent combined knee pads and body rest used by a Singer rider in the Victorian M.C.C. hill-climb at Wheeler's Hill. Separate devices of this kind are regularly used by racing motor cyclists in this country; the Australian patentee has combined the two.

A Lucky Escape.

The tinned beef and biscuit food was not exactly relished by the motor cyclists, but most managed to keep in the best of fettle. Riddell had a narrow escape during the retreat. He had been granted a few hours' leave, and naturally took to his bed. Five hours later the Germans had progressed faster than expected, and Riddell was aroused by a Frenchwoman when a German cavalry regiment was only a quarter of a mile distant. He dashed to his machine, and pushed off just as an outpost gave chase. Luckily, his Zenith fired from cold at once, and in the exciting race which followed the motor cycle easily won. Luckily for Riddell the German rifle shooting was poor, but nevertheless he afterwards extracted one bullet from the kit bag on the carrier.

Corporal Riddell tells us that he saw with his own eyes a number of German atrocities which have been reported, and, generally, he was not impressed with the average German soldier. The enemy's soldiers seemed to be largely an undesirable class. For ten days, that is during the retreat upon Paris and the subsequent chase of the Germans after their advance had been arrested, Riddell had no opportunity of moving his clothes, and a wash he regarded as a luxury.

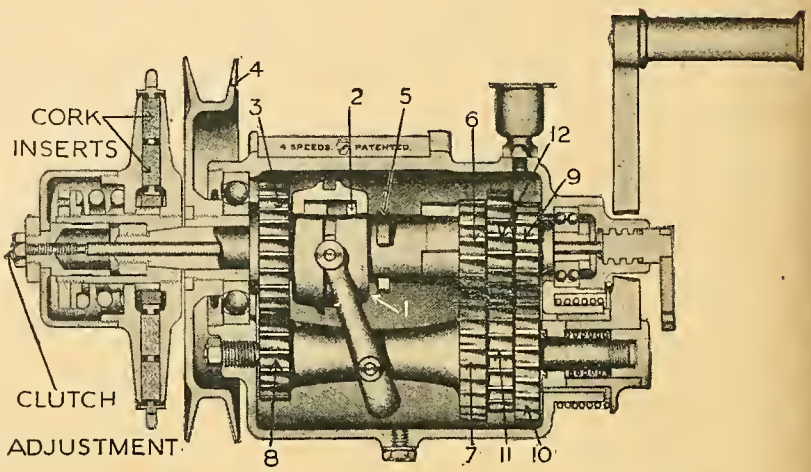
It was at the battle of the Marne that Riddell's first experience of soldiering unfortunately came to an end. He was at the time returning on his machine from the firing line with a despatch when a shell burst a few yards in front of him, totally wrecking the machine, but he luckily landed on a soft bank at the roadside. A piece of metal the size of a horseshoe nail entered his right side, but soon he was picked up by a motor ambulance, and sent by train to St. Nazaire and subsequently to Leicester. Riddell, who is just the dashing experienced kind of rider the Army wants, expects to be out again in about three weeks' time, and is anxious to return to the front if another motor cycle can be found for him. He seemed to be most sorry to lose his "old 'bus" as he termed it.

A Four-speed Countershaft Gear.

Latest Production of the Jardine Factory for 1915.

THERE was never any doubt that the greater the number of ratios a gear possessed, provided that the gear were not complicated and unreliable, the more suited it became to the needs of motor cyclists. Experience has proved that just as the two-speed gear is streets ahead of a single gear, so is the three-speed superior to the two, and now there are indications that the four-speed gear is to receive well-merited attention at the hands of manufacturers. The first of these ready for inspection is the Jardine, made by John Jardine at the huge factory in Nottingham, where a portion of the works and special plant have been set aside for the manufacture of the 1915 model gear. The name of Jardine as applied to gears is not new; as a matter of fact, the appearance of the latest gear is an interesting example of how experience favours an increased number of ratios, for the original Jardine "G. H." gear had two speeds, last year three speeds, and the new production four speeds.

The beauty of the latest gear is that the extra ratio has not been obtained at the expense of complication; in fact, the same number of gear wheels are embodied in the construction as in the three-speed gear, and the additional ratio has been provided by utilising the kick-starter gear and wheel carrying the ratchet, as driving gear wheels. Thus, by a smart piece of designing four ratios are obtainable with the complications of three, but that is not all, for in the latest box the whole of the parts, including kick-starter mechanism, are enclosed in an aluminium case formed in one piece, so that escape of oil is impossible, which not only spells economy in oil but also a clean exterior casing.



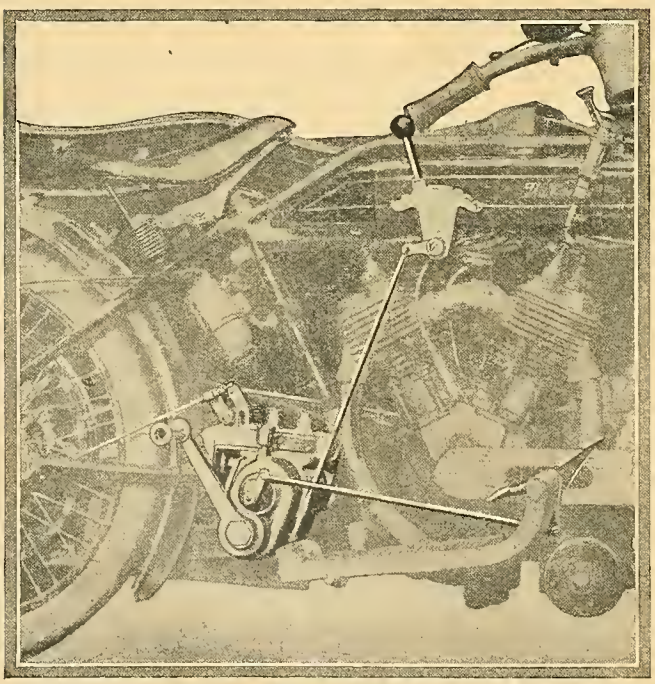
Section of the new Jardine four-speed countershaft gear described on this page.

We publish with this description a drawing showing the interior mechanism of the new box, and before proceeding to describe its working may detail its main features. Firstly, all gear wheels remain always fully in mesh; secondly, the whole of the changes are effected by a single dog clutch; thirdly, the kick-starter mechanism, being part and parcel of the gear, is always lubricated so long as there is oil inside the box; fourthly, two neutral positions are provided, viz., between the first and second, and third and fourth ratios.

The Combined Drive Adopted.

Chain and belt transmission is provided for on the 1915 gear box, which method of drive has attracted many makers of experience; so long as the pulley is of large diameter, as in the case of the Jardine, which is 8in., this form of drive is suitable for even high-powered sidecar outfits. As regards bearings, the main shaft itself revolves on caged ball bearings, whilst in the case of the layshaft and other loose wheels bronze sleeves are used. Nickel steel on bronze is the general order, as this combination is found to be less exacting in the matter of lubrication, though, incidentally, this important question has received especial consideration, holes being drilled at a tangent to the direction of travel to scoop up oil, and the usual splines are also formed on the shaft.

The cork clutch has a single plate with a double row of corks, and has been found to answer all requirements, having been subjected to constant slipping with no ill effects. Certainly, in our tests the clutch took up the drive of an 8 h.p. sidecar outfit with wonderful smoothness.



The new Jardine four-speed countershaft gear and change speed rod.

A Four-speed Countershaft Gear.—

In following the actual working of the gear it should be remembered that:

Pinion 9 is keyed to the main shaft.

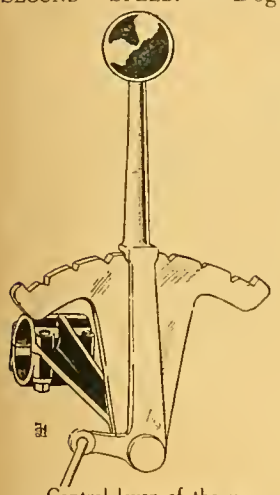
Gear wheels 10 and 11 are in one piece, and free to revolve on the layshaft.

Gear wheel 12 is secured to first reduction dogs 5 by phosphor bronze sleeve.

TOP OR FOURTH SPEED.—On the main shaft driving dogs 2 are formed from the solid bar. A direct drive is obtained by coupling these driving dogs to the dog clutch 1 and the dogs on the main gear wheel 3, to which the belt pulley is secured.

THIRD SPEED.—The first reduction dogs 5 are coupled to the main gear wheel dogs 3 by sliding the dog clutch 1. The drive is then through 9 to 10 and 11 to 12 and 3.

SECOND SPEED. — Dog clutch 1 connects the driving-shaft dogs 2 to small gear wheel 6, which wheel revolves the lay axle gears 7 and 8, thereby rotating the main gear wheel 3 at a double reduction.



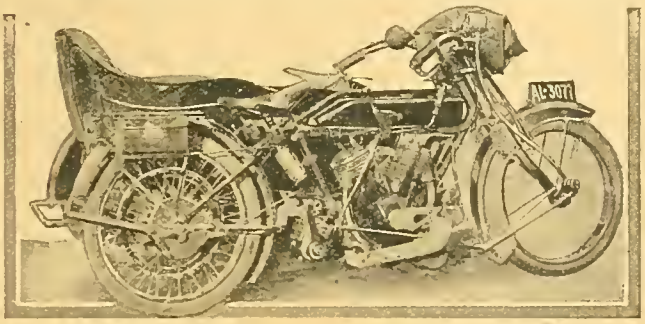
Control lever of the new Jardine gear. Two free engine positions are obtained.

FIRST SPEED OR LOW GEAR. — The dog clutch 1 couples the first reduction dog 5 to the small gear wheel 6, the drive then being through 9 to 10, 11 to 12 and 6, through the lay axle 7 and 8, to the main gear wheel 3, thus giving a triple reduction.

The ratios provided are approximately 4 to 1, 6⅓ to 1, 8⅔ to 1, and 14½ to 1. General details of design are: The use of gear wheels ⅝in. wide, 10 pitch, each part made to jigs so that interchangeability is ensured, weights 28 lb. made up as follows: Gear, kick-starter and pulley, 21 lb.; clutch, 7 lb.

A Trial on the Road.

After examining the construction of the gear we were taken on the road by Mr. George Hunt, who has been testing the new gear on the 8 h.p. Campion side-



The 8 h.p. Campion, fitted with Jardine four-speed gear, on which our tests were made.

car outfit with which he won a gold medal in the Six Days Trials. The ease of starting from a standstill we have already referred to, but it was the manner in which the gears could be changed that impressed us. A touch of the valve lifter and our driver slammed in the gears one by one without difficulty, and then purposely resorted to the extreme test of changing from first to top, and suddenly down again. This sort of hard usage we are assured the gear has withstood for over a thousand miles. In Nottingham traffic our pilot changed up and down as certainly as with a variable pulley gear. In future, gear changing even with a four-speed box, need no longer worry the novice.

TRADE PROSPECTS.

Competition with Germany and Austria-Hungary in Neutral Markets.

RECENT notes issued by the Board of Trade contain some very useful hints respecting goods to be exported to South Africa, and as South Africa is a very large customer of this country in motor cycle goods, we reprint them for the benefit of our readers:

"His Majesty's Trade Commissioner reports (August 25th) that there seems to be no doubt that British trade in South Africa will receive an enormous impetus as a result of the complications in Europe, although it may be acknowledged that the immediate prospects of trade are not of the best. There is considerable anxiety on the part of merchants with regard to stocks now on the water; but the effect of the moratorium in operation in the United Kingdom is that merchants fear that oversea manufacturers in all parts of the world will not be disposed to trade with the South African market so long as it is thought that payments for consignments are liable to be temporarily withheld in transit by the London banks.

"The Trade Commissioner emphasises the importance of attention being paid to the following details of trade organisation by British manufacturers desirous of taking advantage of the extended possibilities of the South African market as a field for their enterprise:

"(1.) The need for local representation.

"(2.) The enormous advantages that, as a rule, follow the visit of a principal to South Africa for the purpose of becoming intimately acquainted with local conditions of trade.

"(3.) The necessity for meeting foreign competition by the supply of articles identical with those being exploited by our foreign competitors (*e.g.*, enamelled ware, cheap musical instruments, cheap toys, etc.)

"(4.) The adoption of an overhead charge in all cases where South African trade custom makes it necessary.

"(5.) The study of packing, in order that handling, both on the part of the wholesaler and retailer, may be reduced to a minimum of labour with a maximum of convenience.

"(6.) Sympathetic and generous treatment towards the local representative, and a strong endeavour to adjust the exporter's point of view to that of the South African merchant."

LATEST DESIGNS.

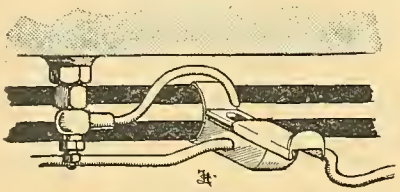
Advance Descriptions and Illustrations of 1915 Model Motor Cycles and Accessories.

TWO NEW KING-DICK MODELS.

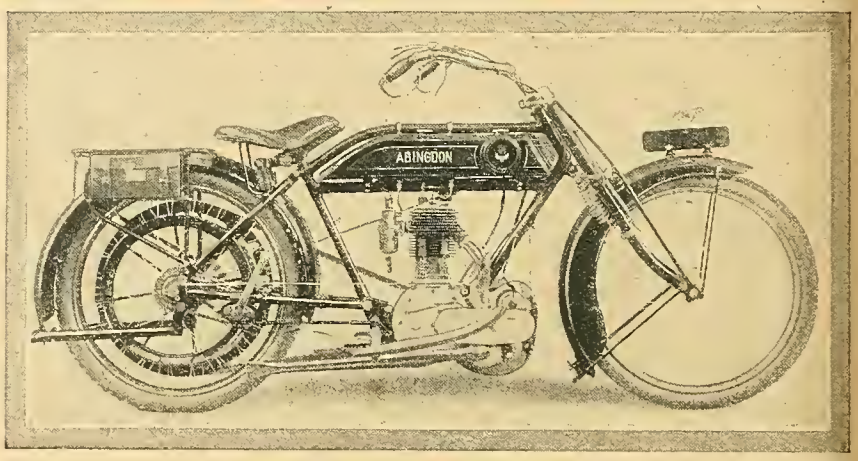
ONE of the sturdiest and most complete motor cycles we have yet seen is the new 5-6 Abingdon King-Dick. The long stroke twin engine remains the same, as it has given such satisfaction in the past that no alterations are considered necessary. The frame, however, has been considerably altered, largely with the object of making it ideal for Overseas work. A very noticeable feature is that there are no angles in the tubing, and the rear stays are bent as little as possible. The top tube is, of course, an exception, as it is dropped to give a low riding position. Very powerful fork ends are used, and both stands are held up to their attachments by spring washers so as to prevent any signs of rattle. Druid forks are now standard fittings, and a very big rake has been given to the steering head with very beneficial results to the steering.

The mudguards are excellent, and not only does the end of the rear guard hinge from the carrier, but the whole guard may be removed without touching a single inside nut. This has been accomplished by mounting the guard on a detachable bridge piece which may be removed from the outside. The carrier has been strengthened, and almost every possible luxury is fitted in the way of footboards, tool-bags, etc. A new type of Benton and Stone drip feed lubricator is used, which allows the oil to be poured through under exceptional circumstances by a touch of a neat lever and without disturbing the normal setting.

Another refinement consists of a distributing box for the priming device, which is so arranged that after opening the compression cocks it is only necessary to turn on one tap to prime both cylinders. The tank has undergone modifications, and will now hold two and a quarter gallons of petrol and three pints of oil, the oil tank being tubular and let into the petrol tank.

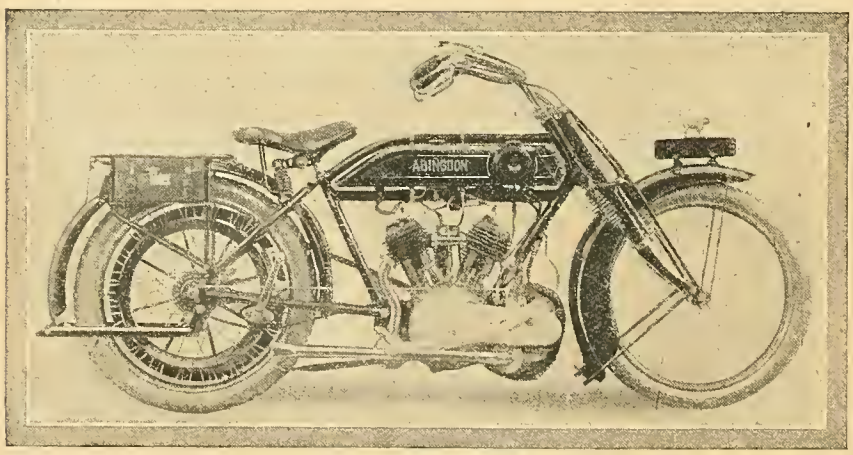


Priming box on Abingdon King-Dick. Petrol is injected to both cylinders after pulling back the slide.

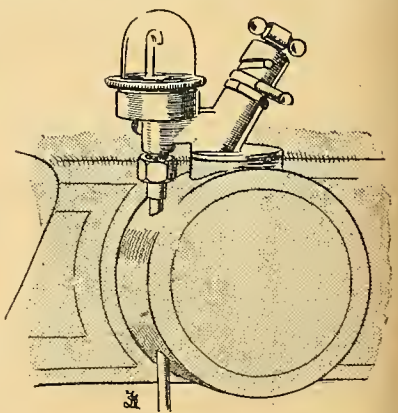


The 3½ h.p. single-cylinder Abingdon.

The footbrake is exceptionally powerful, strongly constructed, and works on the inside of the V of the dummy belt rim so that the wheel may be detached without touching the shoe. The model we inspected was fitted with a Sturmey-Archer three-speed hub, and a similar type with a three-speed counter-shaft gear will be ready in a short time.

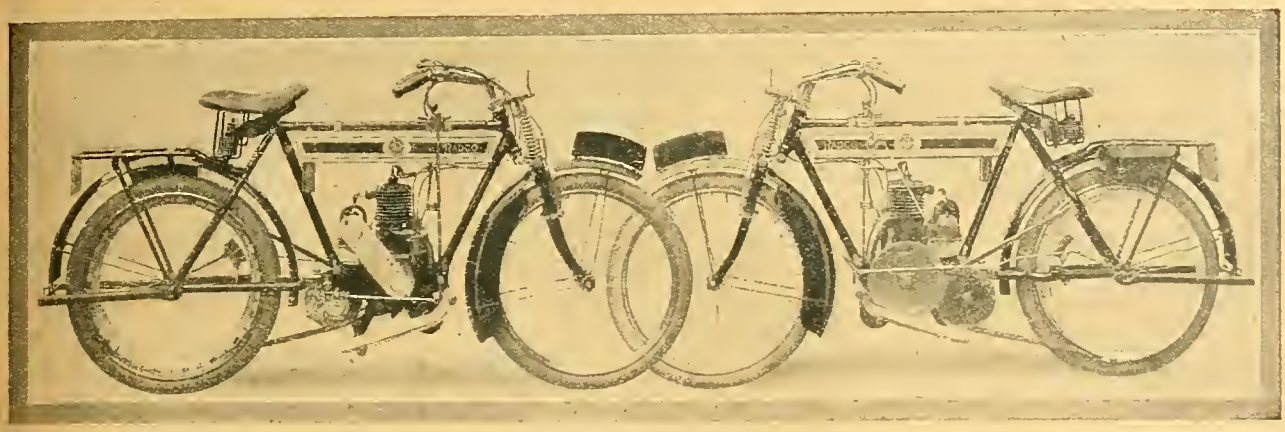


The 5-6 h.p twin-cylinder three-speed Abingdon.



New Benton and Stone lubricator on Abingdon King-Dick.

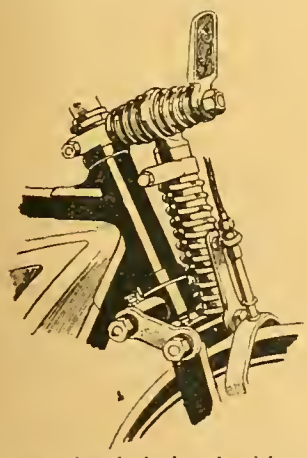
The 3½ single-cylinder model is an exact counterpart of the 5-6 except for the engine, which is the King-Dick 500 c.c.



A specimen of the latest two-stroke two-speed Radco.

LATEST TWO-SPEED RADCO.

We have recently been able to inspect one of the latest models of Radco two-stroke. The little 62 × 70 mm. engine is, of course retained, but there are one or two additions of some importance. A two-speed Albion gear is fitted to the bottom bracket, the drive being by belt and chain, and as the single-geared model was a fine climber, this addition should render it a go anywhere mount. This model is fitted with comfortable inclined aluminium foot plates and a metal enclosed tool-bag. The Bowden wires are neatly held to the bottom of the tank by metal slides. The front mudguard has deep side wings, and one of the most important points is in connection with the spring forks.



Showing springs for backward and forward movement in the new Radco fork.

Previously these have given an up and down motion only, but an attachment can now be supplied which gives an additional forward and backward movement. This consists of buffer and recoil springs arranged to act on a special head piece, which also forms the outer sleeve of the original springing. The conversion from the old type is such a simple matter that it can be easily carried out by an amateur mechanic, and previous Radco owners are encouraged to try the new fitting by the generous offer which the firm make.

If the owner will send to the firm (Messrs. Radnall and Co., Dartmouth Street, Birmingham) the name of the agent through whom he purchased the machine and also the frame and engine number he will be supplied with the new article free of cost. The increase in comfort is said to be considerable, and this is only to be expected, as a great amount of shock is taken by the double springing without being transmitted to the frame.

THE F.R.S. DYNAMO LIGHTING SET.

We illustrate herewith the new 1915 dynamo set, made by the F.R.S. Lamp Co., Pershore Street, Birmingham, and fitted to a Douglas machine. As will be seen, the dynamo, very neat in appearance, is attached to the saddle pillar tube and driven by a belt from a pulley fitted to the counter-shaft. The current generated can be taken to the lamp direct, or used to charge the eight-volt accumulators, which are carried in the position usually occupied by the generator of an acetylene set. The candle power produced is twenty-four, and anyone conversant with electric lamps will realise that this will throw a splendid beam when the reflectors are of correct parabolic shape, and we can well believe the claim that this lamp is far more effective than the best acetylene sets made by the firm. It is claimed that five telegraph poles can be seen quite clearly. The candle power can be split up and used in several lamps, head, side, and tail as may be required, but the total candle power must not exceed twenty-four or the current will be taken from the accumulators faster than they can be recharged.

Switches are provided to enable the current to be used direct or through the accumulators, and to give the usual charging, on and off positions.

We understand that a large number have already been ordered and that delivery can begin in about three weeks. The set is made to fit most standard machines, and the price will be £5 10s., or with larger lamp £6 6s. The whole apparatus is self-contained, and requires no attention except that the special brushes may require looking to every 2,000 or 3,000 miles.

The F.R.S. electric lighting set as fitted to a Douglas The dynamo is attached to the down tube and the head light and accumulators on a combination bracket.

The Price of Petrol.

An official of the Standard Oil Co. has stated that, in his judgment, there is not likely to be a change in the price of petrol for the next two years.

Automobile Engineering and the War.

At the opening meeting of the session of the Institution of Automobile Engineers, a paper will be read by Mr. L. H. Pomeroy, entitled "Automobile Engineering and the War," in which important suggestions will be made for the conduct of business during war time. All who are interested will be admitted on presentation of their visiting cards at the door. The meeting will take place at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., at 8 p.m., on the 14th inst.

An Excelsior Two-stroke.

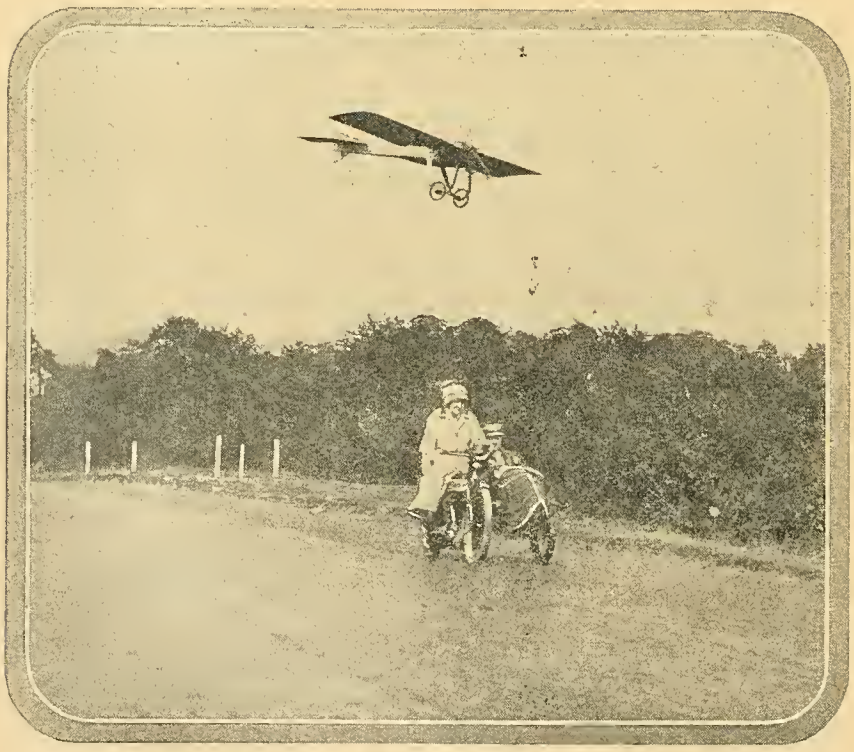
In addition to the 8 h.p. twin-Excelsior which is announced for 1915, Messrs. Bayliss, Thomas and Co., of Coventry, have practically decided to make a further addition to their range of models, in the shape of a 2½ h.p. two-stroke mount. The new twin may have a four-speed gear.

Lady Motor Cyclists Leave for Belgium.

Two lady riders, Miss Chisholm and Mrs Knocker, whose work in connection with the proposed ladies' trial will be recalled, left London last week to assist at a Red Cross centre in Belgium. It is not known, however, at what place they will be stationed.

Rally of 1915 Models.

A rally of 1915 model light cars is proposed by the Cyclecar Club towards the end of November. The idea is that as there will be no show, the motorists in and around London shall seize the opportunity provided by the rally of the 1915 models, say at Wisley Hut or Burford Bridge, to inspect the latest designs.



A lady driving a sidecar combination on the "Fairmile," Cobham, while a military monoplane passes overhead.

SPECIAL FEATURES.

NEW DESIGNS (Illustrated).
A DESPATCH RIDER'S EXPERIENCES.
A TRIAL OF A MONOCAR.

The Fosseway.

We are glad to hear that the Leicestershire Automobile Club has a scheme under discussion for the improvement of the Leicestershire portion of the Fosseway. At present it compares very unfavourably with the Tarmac surfaced roads under the control of the Notts County Council.

Motor Cyclists in the Canadian Contingent.

From across the Atlantic we learn that thirty-two motor cycles are included in the Canadian Division of the Army. The commanding officers have motor cyclists attached to the staff, the 72nd Cameronian Highlanders have four motor cyclist scouts, and each brigade has three machine guns on lorries, with motor cycles and sidecars to convey emergency ammunition.

Severe Trials Vindicated.

The interesting details given in our last issue of the tests for the selection of motor cycles for the Russian Army, recall vividly the severities of the last two A.C.U. Six Days Trials. They prove to the hilt the contention of the Auto Cycle Union that such tests were necessary, and those makers who had the pluck to face these tests in the past knew that their machines were capable of the demands put upon them by the Russian Army representative, and have been rewarded by substantial orders.

War Office Ban on V Twins.

On the subject of V twin-cylinder engines which we dealt with in our last issue, we have received a reply from the Rev. F. W. Hassard Short, secretary of the Motor Cyclist Reserve Committee, Home Counties Division, which we publish on another page. In his notes the Rev. Hassard Short mentions that there are vacancies for experienced motor cyclists in the signal companies of the new Expeditionary Force, and invites readers to apply to him for the positions. Though we have no doubt of the response which will be received for the vacancies, we would point out that, should more motor cyclists be required, the A.C.U. has a list of some 1,500 motor cyclists (including several hundred names furnished by *The Motor Cycle*) who are willing to serve their King and country. Included among this number are many of the leading motor cyclists of the day.

Petrol at 1s. a Gallon.

We are pleased to see that several newspapers are taking up our suggestion of a substantial reduction in the price of petrol with some enthusiasm, and we hope that the petrol companies will consider the question seriously, for we believe that such a reduction would be to their ultimate advantage, as well as to the good of the motor industry in general.

Engine Starting by Acetylene.

A writer in a foreign contemporary states that he has been entirely successful in starting a refractory engine by means of acetylene led through a flexible tube to the induction pipe. Though there is nothing new in the use of acetylene for running an engine our own experience is that starting is difficult, but once under way the engine runs well.

New Ruling Concerning Appeals.

Up to the present a motorist has been able to appeal from a conviction by a Justice of the Peace if the fine imposed exceeds £1. From the 1st of December next he will be able to appeal against any conviction of a Court of Summary Jurisdiction to a Court of Quarter Sessions, provided that he did not plead guilty or admit the truth of the information against him.

A.A. and M.U. Notes.

MOTORING DURING WARTIME.—The Automobile Association and Motor Union is able to report that during the past two weeks a distinct revival of motoring in all parts of the country is to be noted. The departmental records kept by the A.A. show that last week over one hundred members applied at the London headquarters alone for free legal defence. This figure not only shows that British motorists are bringing their machines out on the road, but it also indicates that "measured distances" are more prolific than many would have us believe them to be. The daily reports sent in by the A.A. patrols also indicate that the stop watches are being freely used.

British Despatch Riders.

The following paragraphs were issued by the Press Association last Friday:

"The fine work of the volunteer British despatch riders has called forth the warmest praise of the Allies' commanders, who have been enabled through their services to maintain a constant communication along the huge front, extending about two hundred and forty miles from the Somme to the Moselle, and along the frontier of Alsace Lorraine.

"Many of these young fellows are just fresh from the Universities, and have had no previous military experience, but they show remarkable dash and bravery while travelling on motor cycles through country infested with enemies.

"Yesterday an Australian youth from Cambridge, while speeding along a country road, met a party of fourteen German cavalrymen. He was unable to turn, and drew his revolver and shot down an officer and one man. The others turned and fled, and the despatch rider was able to deliver his despatch, which informed a corps commander that Germans were in the vicinity, and thus prevented what might have been a disagreeable surprise. One member of the corps has been promoted from corporal to lieutenant in three weeks."

The Russian Government Orders.

The Rudge Company and, it is said, the B.S.A. and Indian companies, have in hand orders for motor cycles for the Russian Government. The terms of the Russian Government's orders are extremely severe. Though a certain supply of spare parts are ordered with each batch of motor cycles, these must not be touched for two months, and should any part of a machine give out within that period, the Russian Government exact a penalty amounting to ten times the makers' list price of the defective or broken part.

There is a likelihood of a number of well-known riders spending their winter in Russia looking after the army motor cycles, including S. Wright, J. Oliphant, and A. J. MacDonagh.

A Comprehensive Issue.

Motor cyclists have become accustomed to look to *The Motor Cycle* for the earliest descriptions and illustrations of new models. In this issue we publish photographs and details of the new racing Morgan, a machine of novel and striking design propelled by an eight valve engine, intended for the Cycle Car Race; the Jardine four-speed counter-shaft gear, which a number of different manufacturers propose to adopt as standard; two new King-Dick models for 1915; the latest two-speed Radco; a double-purpose Bramble sidecar; an attractive cylinder design, having an aluminium casing and fins, and a new Jelley hammock saddle.

In lighting outfits the Low acetylene generator and the F.R.S. dynamo lighting set will create interest, and the competition side is represented by details and photographs of the Mersey Club's map reading test, a twenty-five mile road race in Victoria, and an informal event arranged for the motor cyclist special constables.

DESPATCHES.

Swift as a bullet out of a gun
He passed me by with an inch to spare,
Raising a dust cloud thick and dun
While the stench of lubricant filled the air.
I must admit that I did not like
The undergrad on his motor bike.

I have seen him, too, at the wayside inn,
A strapping lad scarce out of his teens,
Grimy, but wearing a cheerful grin;
A young enthusiast, full of beans.
While his conversation was little better
Than pure magneto and carburetter.

Now he, he has got the chance of his life,
The chance of earning glorious scars,
And I picture him scouring a land of strife,
Crouching over his handle-bars,
His open exhaust, with its roar and stench,
Like a Maxim gun in a British trench.

Lad, when we met in that country lane
Neither foresaw the days to come,
But I know that if ever we meet again
My heart will throb to your engine's hum,
And to-day, as I read, I catch my breath
At the thought of your ride through the hail of death!

But to you it is just a glorious lark;
Scorn of danger is still your creed.
As you open her out and advance your spark
And humour the throttle to get more speed,
Life has only one end for you,
To carry your priceless message through!

—TORCHSTONE in the *Daily Mail*.

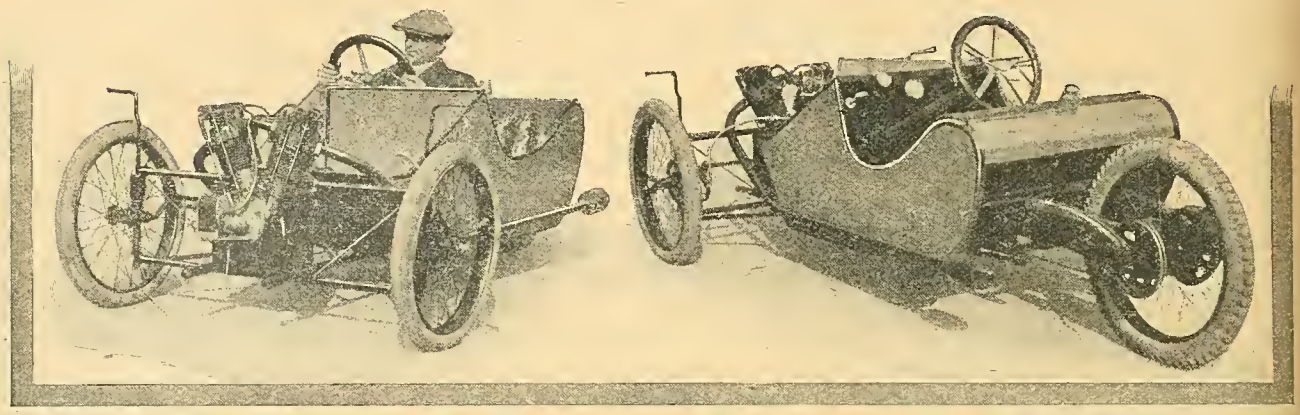
THE NEW RACING MORGAN.

Eight-valve Air-cooled Engine; Extremely Low Centre of Gravity.

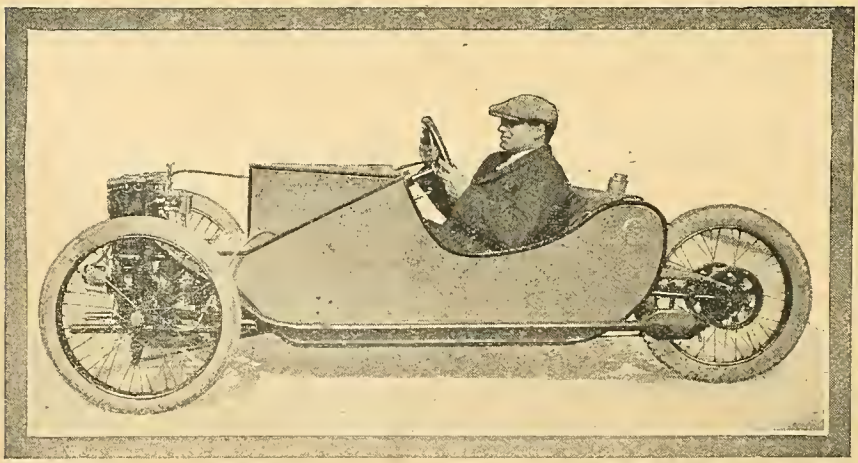


The racing Morgan, specially built for the postponed International Cycle Car Race.

A VEHICLE, concerning the novel features of which many rumours gained currency as the date of the International Cycle Car Race drew near, was the new racing Morgan. It was known that a number of these machines were being specially designed for the race, and a great many fancied their chances against the four-wheelers. The Isle of Man race, as everybody knows, was abandoned owing to the war, and we are now enabled to publish illustrations and a description of the new Morgan racer. When we state that the engine is a special eight-valved air-cooled M.A.G., of a bore and stroke of 82 mm. × 102 mm. = 1,078 c.c., it can be well believed that the runabout has proved much faster than anything which the Morgan Motor Co. has turned out hitherto, these remarks applying particularly to speed on gradients.

Constructional Details.

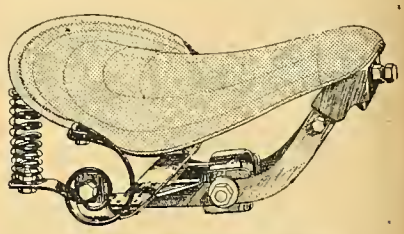
The chassis is the standard Grand Prix type in almost every particular, though the back forks are widened slightly, and larger brake drums are fitted. The gear is of the usual Morgan two-speed type, the ratios being 3¼ and 5¼ to 1 respectively. The clutch is of standard design, but no outside flywheel is fitted. The bodywork is entirely of wood, whilst the front is pointed as shown in the illustrations, and accommodates a good supply of tools. The back part is held together by a large petrol tank the capacity of which is about six gallons—sufficient fuel for a trip of approximately 200 miles. The petrol is pressure fed to an Amac carburetter possessing a very large float chamber, and the pressure is maintained by a pump on the dashboard, discernible in one of the illustrations. A pressure gauge is, of course, fitted. The exhaust is conveyed to the rear of the vehicle by two long and almost straight pipes extending along the sides of the body. The silencers are fitted at the ends of these pipes, and, incidentally, they can easily be removed for racing purposes. One of the most remarkable features of the new racing Morgan is the exceptionally low centre of gravity, the object, of course, being to render the machine safe on corners in particular, and, indeed, the vehicle has proved to be possessed of wonderful stability.



H. F. S. Morgan at the wheel of one of his special racing runabouts. The engine is an eight-valve M.A.G.

A NEW JELLEY SADDLE.

MR. JELLEY, of Spon Street, Coventry, has been responsible for several ingenious devices, mostly in connection with the personal comfort of the motor cyclist. His latest novelty is a cleverly designed saddle, which combines the good points



A newly designed Jelley saddle.

of the hammock saddle with those of the more usual solid top type. The framework is exceptionally strong, and at its rear end is formed into leaf springs, both transversely and longitudinally. The transverse springs have attached at each side the end of a powerful wire spring, the back of which carries the strong fabric of the hammock seat, and joining this spring to the longitudinal springs are long coil springs, while the nose of the saddle is mounted on a block with a coil spring buffer. (This last is not visible in the sketch as it lies neatly inside the frame.)

The effect is to give a most comfortable saddle, which adapts itself to the rider's shape, and gives a very easy riding motion, damping out the most severe shocks. The construction is clearly visible from the sketch, but it is well to add that the seat is a very broad one, which feature is, of course, not clearly visible from a side view.

WAR ITEMS.

Mr. Glyn Rowden, the chairman of the Cyclecar Club and a well-known motor cyclist, is leaving shortly for Paris, where he will drive a motor ambulance for the Red Cross Society.

G. A. Gregson, of Southport, a well-known rider of a Bat-Jap in leading competitions, has obtained a commission in the Royal Engineers.

Frank May has joined the Public School and University Corps.

Maurice Greenwood, whose adventures in returning across France from Grenoble have already been related in these columns, has joined the Mechanical Transport Section of the A.S.C.

The Bristol Motor Cycle Club has been depleted of seventeen members, who have been called away on active service for the war. Mr. Philip Grout, the hon. sec. of the club, who is the inspecting officer of the Royal Engineers Special Motor Cycle Reserve, South Midland Division, Bristol Branch, tells us that he has sent away men since the war commenced.

BELGIAN FACTORIES.

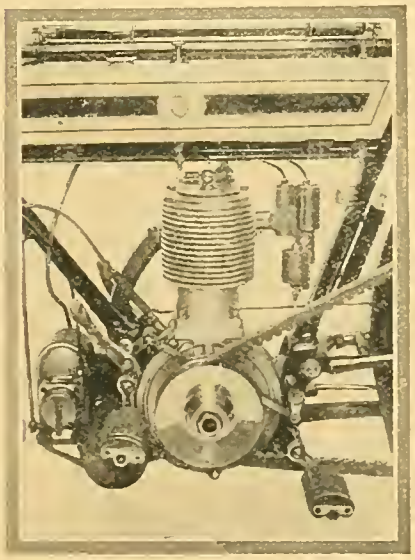
The destruction wrought by the Germans in motor factories has not been so great as was at first feared. A letter has been received by the Institution of Automobile Engineers from the English manager of the F.N. Co. stating that the factory at Liège is intact, and the clerical departments are back at work preparing for next year's programme. The Minerva works at Antwerp have not yet been injured by Zeppelins, and the factory is at work.

MOTOR CYCLES IN THE GERMAN ARMY.

Writing in *The Times* recently "A Neutral" writes: "Where the Germans obtained their vast army of motor cars and motor cycles might at first be thought a mystery, but out of the fifty that the writer saw gathered before the head quarters over one half were of foreign make, there being many English and a few American cars among them. There are to every infantry regiment .at least ten bicycle scouts and, with every brigade, motor cyclists as well, many possessing English and American motor cycles." It is to be presumed that the English motor bicycles have been commandeered from stock in Berlin, or perhaps in a few instances captured. Germany has so persistently neglected the motor cycle movement of recent years that it is not to be wondered at that the German Army has had to fall back upon British machines for their despatch riders.

AN ALUMINIUM ENCASED CYLINDER.

THERE have been many devices for the better cooling of the cylinders of motor cycle engines, but we have never seen a neater or more taking arrangement than the aluminium covered cylinder patented and made by Mr. Wardle, of the Reliance Foundry, Coventry, which we illustrate herewith. The aluminium cylinder complete with radiating ribs is cast on to a liner which may be cast iron or steel, and as it is a proved fact that aluminium is a better conductor of heat than iron or steel, the heat is conducted from the interior of the cylinder and dissipated very quickly in spite of the fact that the cylinder walls are about a quarter of an inch in thickness ($\frac{1}{16}$in. liner and $\frac{3}{16}$in. aluminium). One of the many advantages of improved cooling is a reduced oil consumption with its natural consequence—a cleaner engine.



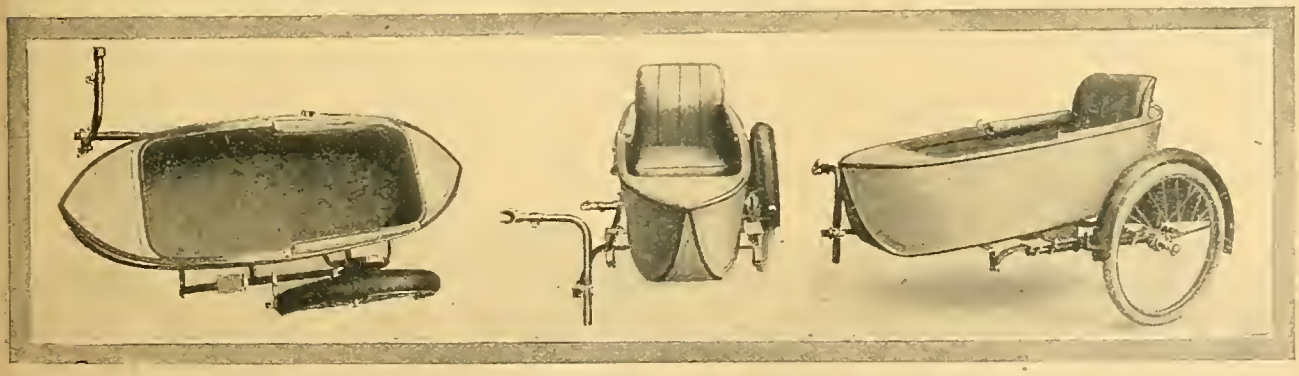
A Triumph fitted with an aluminium encased cylinder giving a wonderfully neat effect.

When the manufacture of these cylinders is taken up commercially the casting will be done in dies, which will produce a perfectly smooth result and ribs as thin as paper if required. The cylinder illustrated is an experimental model, and though it looks exceedingly attractive, it naturally falls short of what the final result will be. A steel lined cylinder with the aluminium case would be a simple job for a two-stroke, and a cylinder of this type should be peculiarly adapted for the high temperatures at which these engines usually run.

A DOUBLE-PURPOSE SIDECAR.

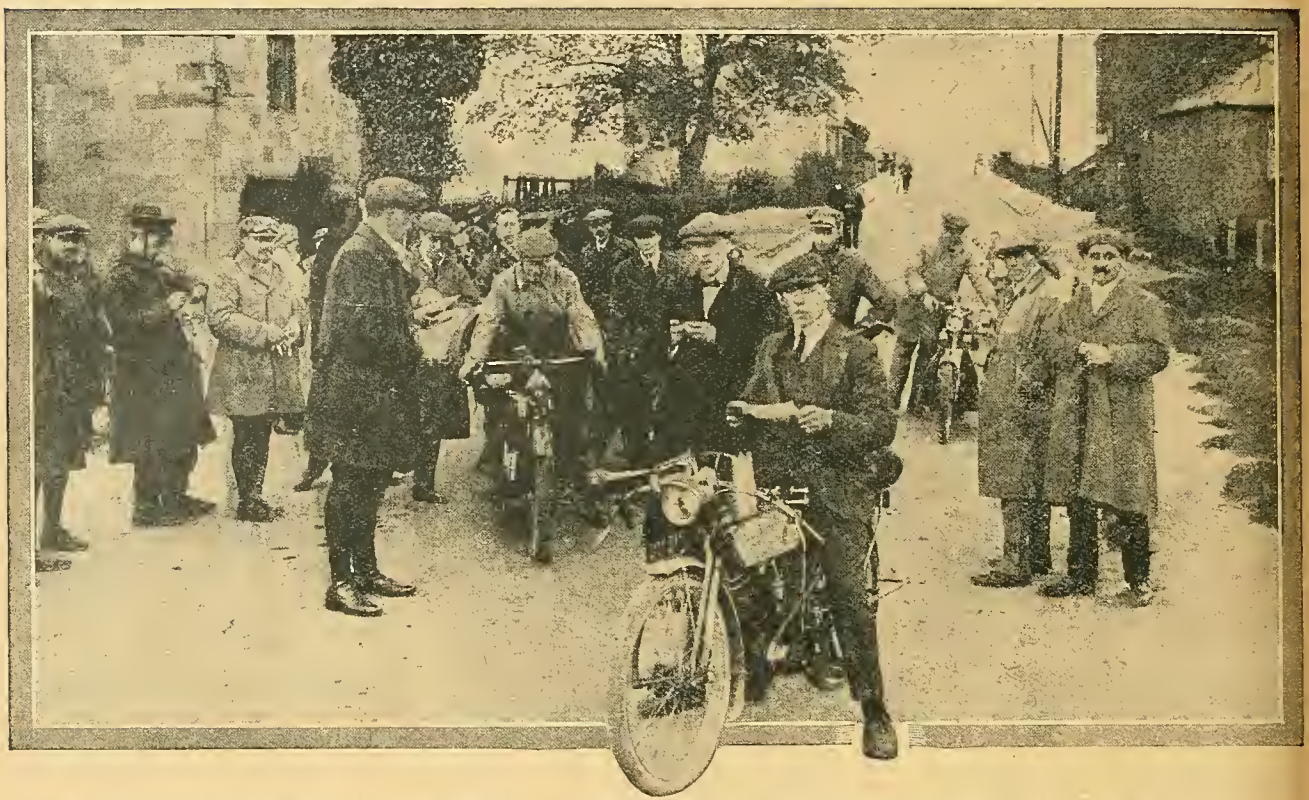
A SOMEWHAT novel solution of the sidecarrier question is the double-purpose sidecar just produced by the Bramble Manufacturing Co., London Road, Coventry. The Bramble Co. hold, and with reason, that many purchasers object to the process of changing bodies, which, with a few notable exceptions, is a long and tiresome job. Therefore, they have designed and constructed a simple canoe-shaped body with a flat bottom. The panels are of steel, which gives great strength, and the design is so simple that lightness also has been obtained. The empty body forms an excellent commercial sidecar with ample capacity, and, what is often almost as important, a large floor space. When a passenger-carrying vehicle is required a comfortably padded back rest is dropped into position, two metal pegs holding it in place. A similar fixing is employed for the tool-box, which, with a deep cushion attached to the lid, forms the seat. A neat footboard completes the outfit, which, in addition to its other features, is pleasant in appearance, and should be eminently suitable for Colonial requirements.

A luggage carrier of somewhat unusual design may be incorporated with the chassis. The carrier is made up of stout strip steel, and when not in use slides under the chassis in guides, and is almost entirely out of sight.



The latest Bramble sidecar—a double-purpose vehicle. As shown in the left-hand illustration, the seat and back-rest may be removed.

THE MERSEY CLUB'S MAP READING TEST.



SCENE AT THE START OF THE MERSEY (LIVERPOOL) M.C.C. MAP READING TEST ON THE 4th INST.
In the foreground will be seen Mr. S. W. Carty despatching the competitors in pairs. The proceeds of this competition were devoted to the Belgian Distress Fund.

The Mersey (Liverpool) M.C. held their fourth sporting trial on the 4th inst., the proceeds being devoted to the Belgian Distress Fund. The start was from the Hawarden Arms, Queensferry, just outside the prison where 2,000 Germans are interned. The course was difficult to find, and, instead of the usual route card, each competitor was provided with a map with the course marked thereon. There were thirty-five competitors.

The first obstacle encountered was a very deep watersplash at Ifrith. Here Farrer James (N.S.U.) turned three somersaults in the water, badly smashing his machine.

A hill near Errwys gave every rider an anxious time, a very sharp hairpin half-way up being banked the wrong way.

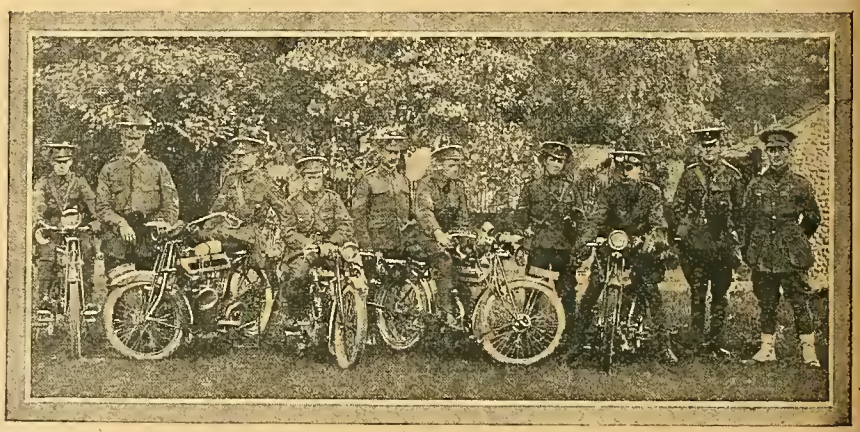
No one managed to complete the whole course, and the judge, Mr. Vance, who kindly offered the prizes for the event, decided to re-run the competition next week.

NEWS FROM THE FRONT.

The last news from the Burney Brothers states that up to the 18th of last month they were well. The Blackburnes were among the few machines used by the despatch riders that had given absolutely no trouble to date, but E. A. Burney had lost his owing to its being driven over by heavy artillery during the night. He is now riding a Douglas, so he still has the pleasure of seeing on outside flywheel on his mount.

Lieutenant A. H. Selwyn, R.E., writes, "At present we are squaring up, cleaning, and repairing machines. Most of my people are undergraduates. They have done very well indeed, and now that they have learned a little about their machines, we will have less damage done. The machines are Triumphs, Douglases, and B.S.A.'s. I must add just a line to tell you that the little Swift cycle car is going wonderfully, and has done about 4,000 miles, and all tyres are as good as new, while the only damage is a broken tappet guide."

Cyril Mocatta had a narrow escape from death the other day. He was given a certain job, but before starting was suddenly taken ill. His substitute started to carry it out and was shot dead, thus Mocatta was posted among the killed.



Two Triumphs, a Rudge, Zenith, and an A.J.S. used by despatch riders attached to the 7th Royal Sussex Regiment at present guarding the Norfolk Coast.

The War Office and V Twins.

MORE LIGHT ON THE SUBJECT.

BY F. W. HASSARD SHORT, Chaplain Kent Cyclist Battalion, Secretary Motor Cyclist Reserve Committee, Home Counties Division.

I THINK I can throw some light on the points raised in the leading article on the above subject in the last issue, and by Frank May in the Correspondence columns. In the first place, there are two sets of regulations for motor cycles, one applying to the Regular Army, the other to the Territorial Force. The Regular Army regulations stipulate "engines of about 500 c.c. with single cylinders, and also horizontal twin-cylinder machines of less capacity." The Territorial regulations allow engines of "at least 500 c.c. with one or more cylinders, and also horizontal twin-cylinders of less capacity." It will be seen, therefore, that V twins are eligible for the Territorial but not for the Regular Army, which accounts for their appearance in photographs in *The Motor Cycle*. One great reason for the restriction in the case of the Regular Army was the difficulty of providing spares for a large number of different makes for an army serving abroad. A further order has been issued now that only Triumph, Rudge, B.S.A., P. and M., and Douglas (with possibly Rover and James) will be accepted for service with the Expeditionary Force. On the outbreak of war the Territorial units which are entitled to motor cyclists, accepted motor cycles of almost any pattern so long as they were in good running order; further, a number of officers and men who are not ranked officially as motor cyclists are patriotically using their machines in the service of the Army at their own expense. It is therefore possible to meet on the roads in England motor cycles of every type ridden by soldiers, and also riders of varying skill (or lack of it).

Why Inexperienced Riders were accepted at the Outset.

With regard to the Expeditionary Force, at the outbreak of war, when motor cyclists were wanted in a hurry to fill the ranks of the signal companies, no doubt a certain number of very inexperienced riders were accepted and sent to the Front. This was for two reasons: first, there was not time or opportunity to test the men, and, second, the War Office having had such difficulty in the past in securing motor cyclists, did not anticipate the rush which actually took place, and therefore took the first who came, lest they might not get enough if they were too particular. Now, however, orders have been issued that no motor cyclists are to be accepted who are unable to carry out ordinary roadside running repairs.

Experienced Riders Wanted for the New Expeditionary Force.

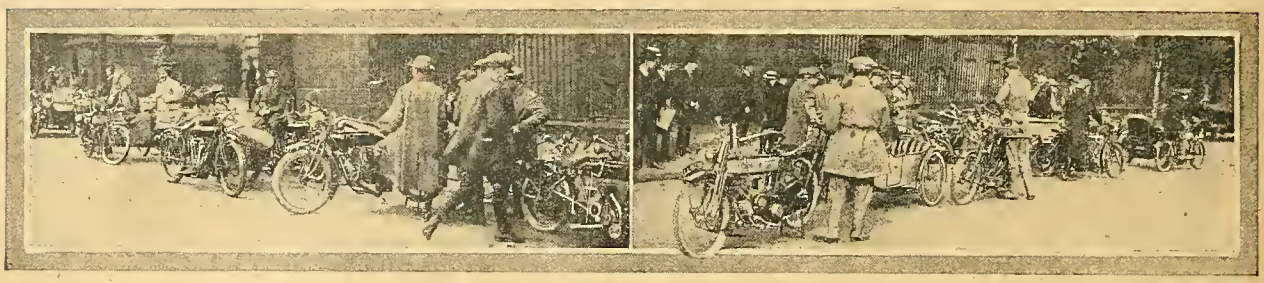
It must be borne in mind, in justice to the motor cyclists, that there are already a great number of very experienced riders in the ranks; many of them are men engaged in the motor trade. With regard to the question of tools or spares, all enlisted men are bound to have a very full kit of tools and spares, but, of course, there is no check on what men, who are riding their own machines at their own expense, may carry in this respect. There are also, I believe, a number of civilian despatch riders employed by the War Office, and I expect there is no regulation or inspection of their machines and kits. It is true that the War Office prefer to enlist a man who can produce a machine which complies with the regulations, but good men whose machines do not comply with the regulations may be accepted and supplied with War Office machines.

There are at present a few vacancies in the signal companies which are being formed for the new Expeditionary Force, and any really experienced motor cyclists who would like to serve their country abroad should apply to me at 2, Castle Street, Canterbury. There are at present no openings for men who are unwilling to serve abroad.

MOTOR CYCLIST SPECIAL CONSTABLES ASSEMBLE FOR AN INFORMAL REGULARITY RUN.

The special constables assembled outside Scotland Yard, for the run arranged at the beginning of the week. The machines owned by these special constables are mainly of British manufacture, but include machines of American, Belgian, and German origin.

Special Constables at Play.

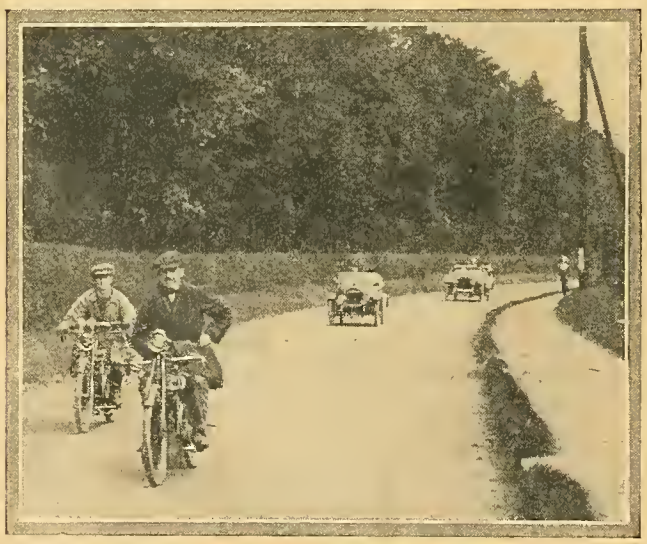


A group of special motor cyclist constables outside Scotland Yard.

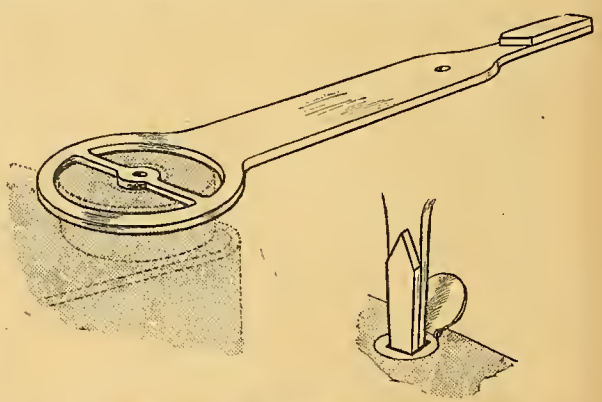
IT is only natural in these times of stress that nearly all trials and competitions should be cancelled, and, in consequence, when any road event is announced, it comes as a pleasant break to relieve the monotony which prevails to so great an extent at the present time to those who cannot serve their country at the front. When war first broke out, Col. Sir Edward Ward took over the work of enrolling and organising a force of special constables, and, recognising how valuable motor cyclists would be, he at once set to work to gather in a sufficient number to meet requirements. Among those asked to assist in this work was *The Motor Cycle*, which was fortunately able to place at the disposal of Sir Edward a list of names of those who were unable to serve with the army.

These men, about thirty in number, are officially known as the detachment of motor cyclist despatch riders to the headquarter staff of the special constabulary. Their work is no sinecure. They attend usually twice a week, on either a night or a day shift, and they have to be ready when called upon to take a message to any part of the Metropolis. They get none of the excitement of the military despatch rider, but instead have long and tedious hours of waiting, only relieved by an order to take a despatch to some out-of-the way place in the East End or elsewhere, where the traffic is heavy and the road surface abominable. They get no pay but receive an allowance of ½d. a mile towards their expenses. As it has been said of the other kind of policeman, their lot is not a happy one, but who can refrain from admiring the cheerful way in which these men effectively carry out their thankless, if not risky, tasks in the service of their country?

To relieve a little the monotony of their existence, to provide a change from the everlasting traffic riding, Mr. J. L. Turner, who is the motor cyclists' sub-inspector, organised a little run or trial on the morning of the 4th inst. Shortly after ten, about twenty men turned up and were ranged outside Scotland Yard, their headquarters, on the Embankment. Mr. Turner gave each man a paper on which his time was marked, and where there was to be found a notice to the effect that the holder was to observe the speed limits and was not to "blind." Then, just before eleven, each man was given the destination—the "fork roads at Gatwick Corner," on the Brighton Road. Altogether seventeen started, which was quite a good percentage, and each man was allowed to take any route he liked. Mounted on a 3½ h.p. P. and M. we followed Robertson (Indian) and Sharples (P. and M.). These two chose the main Brighton Road over Westminster Bridge, and through Brixton, Streatham, and Croydon. The surface was poor for the greater part of the early portion of the route, but fortunately there was little traffic, and the tramlines were not watered. It was a plain, straightforward, go-as-you-please run, and little happened on the journey, only two men, Hoile (Indian) and Wiles (Matchless sc.), failing to arrive. The checking in was carried out by Mr. V. Parker, who is the assistant director of the transport branch of the special constabulary. Mr. Turner, who was in Gapp's Matchless sidecar combination, was carried miles out of his way and only reached his destination after meandering through Kingston. Powell (Douglas), though he came through Sutton, arrived to time, while Tutt (Douglas), Hurley (Singer sc.), and Payne (Douglas) were equally punctual. Of the remainder probably half were too early and the other half too late, while one member of the party succeeded in arriving sixteen minutes too early, which is quite a good effort in a run of twenty-seven miles! Others who finished were Robertson (Indian), Sharples (P. and M.), Connor (Rover), who missed the check, Wolffgang (Sunbeam), Squire (New Hudson), Robbins (N.S.U.), Ferguson (Indian), Holliday (Kerry-Abingdon), Jenkins (James sc.), and Sixsmith (Kerry-Abingdon sc.). After concluding the run most of the party went on to Crawley, and then each man finished the day according to his own inclinations.



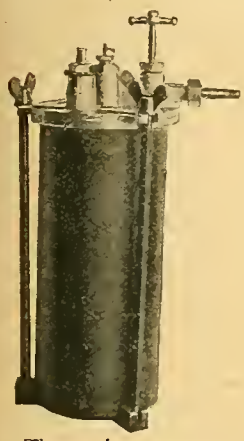
Special constables enjoying the bracing autumn air.



A combined petrol can opener and locker key named the "Autofits" which has been put on the market by Messrs. Autofits of Newcastle-on-Tyne.

The Low Acetylene Generator.

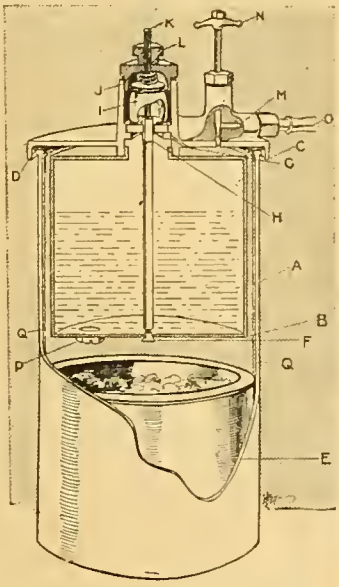
MOTOR cyclists will heartily welcome the arrival of a new generator which promises to be more cleanly, more reliable, and altogether more convenient than the type on the market up to the present. It possesses the advantage of allowing the gas to be turned off and on so long as any live carbide remains and without any wastage. It will thus be seen that it is economical in its action. Of course, the ordinary generator may be used two or three times for short periods after receiving one charge of carbide; but each time there is considerable wastage, as, naturally, the gas goes on generating as long as any moisture is left in the container. The Low generator, however, works upon a different principle. It is, in fact, a small dissolved acetylene plant capable of being recharged by the owner which allows the gas to accumulate under pressure, and automatically cuts off the supply of water as soon as the gas is turned off. It consists of a steel drum A at the bottom of which is placed an ordinary carbide tin of the correct size fitted with a push-on lid, which latter is, of course, removed before placing it in position. It is intended that the carbide should be put up in the special size tins and sold in them, so that if necessary one or two may be carried as spares. To the lid C of the steel drum is screwed the water tank, which is filled upside down after removing the filler cap P. On undoing the milled nut L, the valve F is opened by the pressure of the spring J and water is allowed to drip on to the top of the carbide, when, on opening the main control valve N, the gas issues through the main outlet M through the union O to the lamp. On the gas being cut off, the accumulation thereof continues, and the increasing pressure forces the gas through the narrow passage G into the space above the water; thence it issues through the loose fitting square H on the spindle of the valve F into the ingeniously constructed automatic cut-off. When the pressure exceeds about thirty pounds to the square inch, the rubber ring I is expanded and the valve F pulled up against its seating. No further generation of gas will then occur until the pressure has been reduced by opening the control valve, but when the generator is out of use for a long period it is advisable to cut off the water by means of the milled nut L. As an extra precaution a safety valve is provided. Now acetylene will dissolve in water, and as there is always an excess of water present there is small possibility of explosion. Furthermore, there is a real safeguard in the shape of a lining Q in the steel drum consisting of a mixture of plaster of Paris and asbestos brick compressed, which, like other porous materials, dissolves the gas or occludes its atoms. The particular generator we have described is the car type, but the motor cycle model will be on the market very shortly. It should meet with a very ready demand, and is sold by the Low Motor Accessories Co., 15, Great St. Helens, E.C.



The new Low generator.

PART SECTION OF THE LOW GENERATOR.

A. Steel drum.
B. Water tank.
C. Lid of drum screwed on to water tank.
D. Gastight rubber ring.
E. Carbide tin.
F. Automatic water valve.
G. Passage conducting gas to space above water.
H. Loose fitting square on spindle of valve F.
I. Rubber ring.
J. Spring.
K. Threaded end of valve spindle.
L. Milled nut.
M. Main outlet for gas
N. Control valve.
O. Union to lamp.
P. Filler cap to water tank.
Q. Lining.



The generator dismantled.

SPECIAL CONSTABLES AT PLAY. (See previous page.)

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Free Factory Sites.

Sir,—At the present time there is a great deal being said about the advisability of establishing factories in this country for the manufacture of goods hitherto imported from abroad, but there are many difficulties in the way of our manufacturers—not the least of which is the want of capital.

Recognising this, and wishing to encourage British enterprise, a client of ours has communicated to us his intention to give away freehold sites to firms willing to erect factories for the manufacture of goods hitherto imported from abroad.

As the motor trade is one that has felt, to some extent, the effects of foreign competition, we think our client's generous offer may interest some of your readers. The sites are situated immediately adjoining a station on the G.W.R. main line, about one hour from London.

WAITE AND WAITE (Land and Estate Agents).

Enemy Patents.

Sir,—It is officially announced that "all persons resident, carrying on business, or being in our Dominions," may pay any fees necessary for obtaining the grant, or for obtaining the renewal of patents, or for obtaining the registration of designs or trade marks, or the renewal of such registration *in an enemy country;* and also may pay into the British Patent Office in London, on behalf of an "enemy," any fees payable on application for, or renewal of, the grant of a British patent, or on application for the registration of British designs or trade marks, or the renewal of such registration.

The German, Austrian and Hungarian Patent Offices have issued various temporary rules and indulgences to safeguard certain rights of applicants and patentees which might otherwise have been jeopardised or lost by reason of delays arising out of the hostilities.

Switzerland, though not a belligerent, has likewise provided for special extensions of time for payments and for other matters.

The United States Patent Office, whilst it has no authority to extend the time of filing applications delayed "because of the unsettled condition of European affairs," will probably present the matter to Congress with a view to the obtainment of legislation to remedy the disabilities arising out of such delays. CHARTERED PATENT AGENTS.

The A.C.U. Trials—not Too Severe.

Sir,—I think that we have had far too many complaints in recent years about the severity of the courses of the English and Scottish Six Days Trials, and I was glad to read in your issue of July 30th two letters from well-known manufacturers upholding the A.C.U. in their present policy.

It is to be hoped, as I think most Colonial riders will agree, that the A.C.U. will not show the "white feather" and start organising trials in which every competitor gains a gold medal. Of what use is a trial of this sort if the bad machines and clumsy riders are not shown up in their true colours?

The one thing which I would humbly suggest as a possible improvement is that all machines in the same class should have emergency gear ratios not lower than a certain standard to be decided upon by the A.C.U. Then we should easily be able to spot the weaklings, after a few hundred miles of hard work had spoilt their original tune; but, as it is now, the 3½ h.p. Triumph, let us say, gets no more credit for climbing that bad test hill on an 8 to 1 gear ratio than does the 4 h.p. Konker which knocks its way painfully to the top on a 20 to 1 bottom gear!

No; I say, let the A.C.U. continue to "rub it in" to those short-sighted manufacturers who will send out their machines equipped with rims that buckle and dent, with spokes that break or jump out of their sockets if the slightest bit loose, with forks that let one down miles from anywhere, and fork springs that compel one to ride at the most leisurely fifteen-miles-an-hour tourist gait for fear of breakage, that, in spite of all reasonable care, usually comes about once every 1,000 miles or so. I am not exaggerating our Colonial troubles one little bit, and could mention a few more. C.AZ 100.

Graaff Reinet, South Africa.

What are Ideal Handle-bars?

Sir,—The choice of handle-bars is, in my estimation, a not unimportant point to be considered in the purchase of a motor cycle, concerning which your correspondent Oliver Jones writes in a recent issue, and must depend upon the inclination and intentions of the rider. T.T. bars are a necessary adjunct to speed, but the position which they necessitate is apt to become uncomfortable after riding any distance.

Ordinary touring bars I consider ridiculous for any except the steady, slow, and sure rider, who contemplates covering a limited distance in unlimited time, probably with part of his family in the sidecar. Something comprising features of both these types is wanted, and we find it in semi T.T. bars. These enable one to take corners safely at speed, and are, at the same time, perfectly comfortable for distance riding. As regards knee grips, they are really most invigorating. I confess that merely to be seated on a stationary cycle with knee grips and T.T. bars produces in me most of the sensations attached to an "all out" run on the long touring models. This, I think, is their only advantage, as I have never experienced any troublesome "knee-slip" when travelling at speed, even on fairly bumpy roads. AYSGARTH.

Noisy Motor Cycles.

Sir,—I suppose I ought to thank "Engineer" for his veiled hints at the possibilities of shaft drive being adopted for motor bicycles in the future, but I find it hard to reconcile myself to the qualifications he makes. I am sure that quite the majority of experienced motor cyclists will ask themselves the same question as I asked myself when I read the article, "I wonder how much experience the writer has had, who attempts to suggest fitting a hub gear to wit to the motor bicycle which he puts forward as the type of the future." Does he know that next year will see the end, for all practical purposes, of the hub type of gear, whether two-speed or three-speed?

The reason is quite well known to those who have to consider what they have to make and sell, and I need not say any more. Still, I would like to point out that shaft drive, as applied to the F.N. machine, contrary to eliminating an efficient system of change speed gear, actually makes possible the most efficient all-round change speed gear.

What are the defects of the sliding type of change speed gear "Engineer" refers to? He will probably quote the old and well-worn statement, initiated, I believe, by an eminent French motor engineer, to the effect that a sliding gear was a "barbarous system, but it works." So well has it worked that it has, to all intents and purposes, ousted all other systems. Certain it is that for every defect the sliding type has the epicyclic hub gear has two, so like most compromises it (the sliding type) is the lesser of the two evils.

F.N. (ENGLAND), LTD.
HARRY G. BELL.

The Difficulty of Hearing Sentries.

Sir,—Regarding the suggestion by "Red Indian" in your issue of September 24th, surely he would not have the presence of our soldiers on duty located to a possible enemy. Referring to the danger, on September 21st (the night of which was particularly dark) I came from Sittingbourne to Gravesend, and was stopped seven times by soldiers and police, and on no occasion had I any difficulty in *seeing* or hearing them (in one or two instances a white light was flashed from about twenty yards), although I had only a small electric pocket lamp (my usual King of the Road being out of order). My machine is a Rudge-Multi, and I had never been on the Sittingbourne-Gravesend road before. "Red Indian" ought to observe the limit, and he would find no difficulty in otherwise conforming to the law.

F. J. WEBB.

Running Expenses.

Sir,—The following account of the behaviour and running expenses of a 2¾ A.J.S. may interest some of your readers. I have sold the machine as I have enlisted in the 8th Warwicks.

	£	s.	d.
Cost of machine	52	10	0
Cost of extras	8	10	0
Licences and registration	1	10	0
Insurance (less refund)	1	10	0
Repairs (speedometer)	0	5	0
Druid springs	0	1	8
Petrol (thirty-five gallons)	2	16	0
Oil	0	16	0
Repair outfit, etc.	0	5	0
Carbide	0	1	9
	£68	5	5
Less sale price	42	10	0
	£25	15	5

Distance run, 4,000 miles; total cost per mile, 1.54d.; cost per mile excluding depreciation only, .44d.; depreciation, £18 10s.; petrol, 114 m.p.g. all told with No. 27 jet as fitted by makers; consumption on long journeys, 120; maximum speed in normal circumstances with No. 27 jet as originally fitted, 42·3 m.p.h.; it has rarely touched 45. Lowest gear used twice only, once to cross Pennines and once in Mid-Wales (Llandrindod region). Machine has reached the summit of Clent Hills (donkey track and grass slopes) on top and middle gears, starting from hotel on Bromsgrove Road and non-stop. Cylinder removed twice for cleaning; cylinder scraped through valve caps about four times. Road stoppages, unintentional: Tyres, eight or nine (only four on road); air leak, once; choked petrol pipe, once; plugs sooted twice.

The depreciation is high, due to the large number of extras, early sale through enlistment, and small mileage. The machine would have sold for £40 next Easter with twice the mileage to its credit. The licences, too, have cost 30s. for six months, though this figure would have been the same for twelve months. I have also saved £2 in necessary railway expenses, and countless hours of time. I have not included £2 1s. 9d. for new Dunlop just fitted, as this cost should be reckoned in the running expenses, 4,000 miles to destruction of tyre. I am convinced that to anyone who keeps the machine for two years the total expenses will be under ¾d. per mile, provided that not less than 5,000 miles per annum be run, and less if a greater mileage is totalled. The machine has given absolute satisfaction, and I was sorry to lose it. That I am a school teacher should be a sufficient disclaimer.

H. WALTERS.

A Reader's Specification of the Ideal Machine for Australia.

Sir,—During August of 1912 I purchased a free engine clutch model Douglas and suffered from clutch slip. I wrote to Messrs. Douglas Bros. and asked for advice; to my surprise I received, by return mail, a new 1913 clutch complete, free of charge beyond postage and duty.

I fitted the clutch and found, after trial, that it worked perfectly without any suspicion even of slip. The fitting also was easy owing to the great simplicity of the mechanism, which, to my mind, is one of the virtues of the Douglas motor cycle. Now that I have commenced, please allow me to say a few words in praise of my favourite machine.

During the time I have had it (nine months) I have traversed some of the worst roads in the State and have never yet had a stoppage; I have the same belt that was supplied with the machine, and it is good for a long time to come. The only breakages I have had so far are fork springs, due to the execrable road surfaces; in fact I often marvel at the strength of the frame after going over some bad washouts. Our roads here are not all metalled, just the natural surface banked up here and there, and every shower of rain cuts out fresh gutters across the roads, the succeeding showers deepening them, to the great inconvenience of the unfortunate motor cyclist. Of course, the roads are occasionally repaired, but only very occasionally. Another trouble that we have to contend with is the gathering of mud between the wheels and mudguards in damp weather, which means that after every mile or so one has to get off and pick the mud out of the guards with a piece of wire. I have often wished for another inch of clearance.

But, perfect as the horizontal engined Douglas is, I hope to purchase before very long a motor bicycle which shall be fashioned as follows: A three-speed gear box incorporated in the crank case directly beneath the crankshaft, which would ensure the enclosing of the chain in an oil bath. Instead of having a single bar on which to clamp the crank case I would like to see the power unit fastened between two bars, the duplication continuing to the saddle-pillar tube. A sensitive carburetter could also be placed under the tank behind the magneto, one that would permit the use of paraffin or petrol. I would also like to see the valves operating horizontally instead of inclined as at present, and I would discard the clutch, but fit extra strong wheels and rims for Australian use. The ideal motor bicycle would then be an accomplished fact.

I nearly omitted to mention an all-black finish and the latest Douglas mudguards.

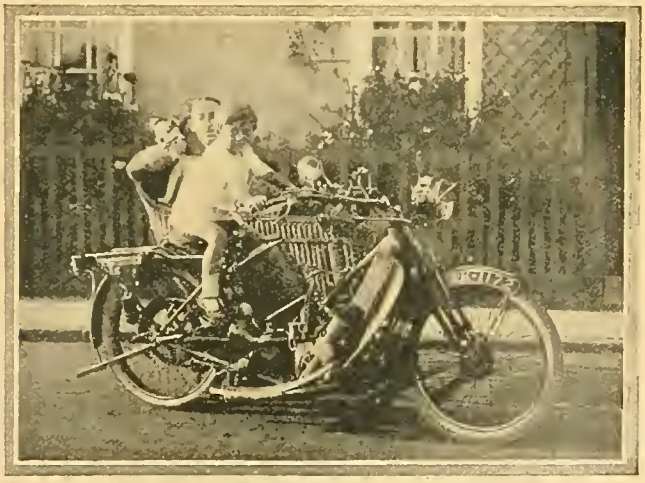
I had the good luck to watch Mr. S. L. Bailey breaking the 3½ h.p. hour record with his little 2¾ h.p. Douglas at the Friendly Societies Track on September, 12th, 1913. He covered fifty-three miles in the hour, the previous best being fifty-two miles.

H. C. FENTON.

Victoria, Australia.

The Latest Recruit.

Sir,—On page 367 of your issue of September 24th there is a photograph of Mr. R. F. G. Kelly on a Scott with "his latest recruit," a lady of 95 years of age. The child in the



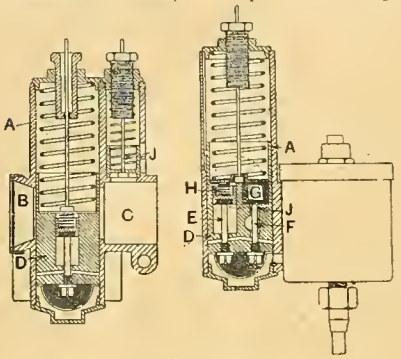
The latest recruit. (See accompanying letter.)

enclosed photograph, I might say, is a still later recruit, and, as a coincidence, is the great grandson of Mr. Kelly's passenger.

GEORGE COX.

A Two-jet Carburetter.

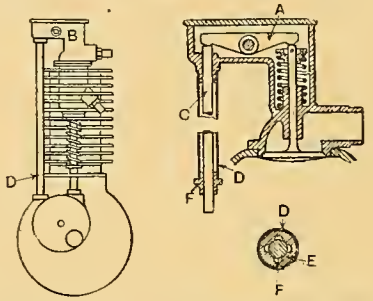
The illustrations are views taken at right angles to one another, A being the carburetter body, B the main air intake, and C the passage to the engine. The throttle D is of special form, being tubular at its upper part, whilst the lower part is solid and provided with holes which pass over the jets E and F. The jet E is the main jet, and F is the pilot jet. To prevent waste of petrol the holes in the throttle are provided at their upper ends with pads adapted to cover the jet outlets when the throttle is fully closed. Of these, G may consist simply



of a pad of leather or other soft substance, whilst the pad H for the main jet is carried by a spring plunger so that it will continue to close the jet outlet even after the pilot jet has been opened slightly. The air inlet for the pilot jet is shown at J and is so arranged that on slight movement of the throttle a small supply of air is allowed to pass the jet F at high velocity, providing a mixture for slow running. The main air inlet and the jet E come into operation on further movement of the throttle. The usual extra air inlet is shown at J.—C. and H. Binks, No. 12,690, 1913.

Overhead Valve Lubrication.

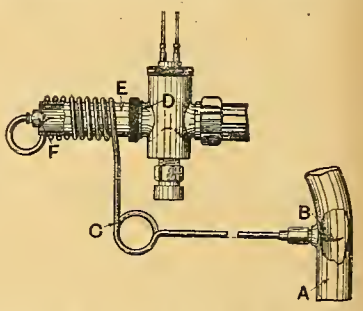
The valve rocker A is completely enclosed in a casing B, and its operating



rod C is contained within a tube D, which extends right down to the engine crank case. The rod C passes through bearings E in the tube D, and these bearings are formed with grooves F. On the down stroke of the piston the air in the crank case is forced along the tube C, through the grooves F, into the chamber B. This air is laden with oil so that efficient lubrication of the valve operating mechanism is ensured.—Soc. Anon. H. and A. Dufaux et Cie., No. 23,078, 1913.

Exhaust-assisted Carburation.

By this invention a small quantity of hot gas is taken from the exhaust pipe A by means of a scoop B, and conducted by



the tube C to the intake side of the carburetter D. The tube C is coiled several times round the intake pipe E for the purpose of heating the latter, and finally terminates in a nozzle F, from which the exhaust gas issues at a velocity calculated to draw fuel from the carburetter jet and assist in atomising it.—H. W. Martin, No. 13,815, 1912.

Long Tyre Life.

A folder has been issued by Messrs. J. Pedley and Son, Ltd., Great Charles Street, Birmingham. This is entitled "11,000 Miles, Still Running," and is descriptive of the wonderful results obtained from Pedley tyres.

Reviews.

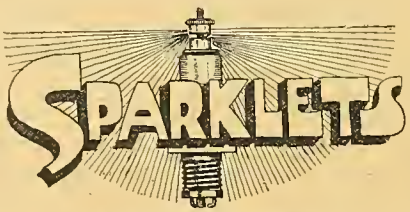
Higham's Magazine, September issue, has a portrait on the front cover of Mr. S. F. Edge, who in the early days of motoring rode a motor tricycle, and the first few pages of the magazine are devoted to an article, which is an appreciation of this well-known automobilist.

A Business Appointment.

We hear that Mr. W. C. Hemy, the well-known competition rider, who for many years has been connected with the sales department of the Service Co., High Holborn, and who has long been prominent in motor cycle competitions around the Metropolis, has joined the firm of W. H. Elce and Co., Bishopsgate Avenue, Camomile Street, E.C.

Repair Works at Willesden.

Among those firms who have recently converted their factories into a general repair works we may mention the M.A.G. Engine Co., Ltd., of Willesden Junction, London, N.W. Mr. de Lissa, during recent slack times, has made all arrangements to take on any form of repair to all types of motor vehicles, and readers who want their machines (motor cycles or cars) overhauled could not do better than hand them on to the makers of the M.A.G. engine.



Two-strokes in Ireland.

We understand that Mr. M. J. Fitzgerald, Richmond Hill, Cork, who has been so successful in Irish competitions and hill-climbs on his Levis, has been appointed travelling representative for Messrs. Butterfields, Ltd., with a view to further popularising the Levis in Ireland.

Lodge Plugs for Polar Work.

The sparking plugs chosen for use on Sir Ernest Shackleton's South Polar Expedition are, we learn, all Lodge plugs. Also a large number of Lodge plugs are being used in the present war. Besides the quantity supplied to the War Office and Admiralty, delivery has just been completed of a consignment of Lodge plugs for the Belgian Army.

Silencers for War.

Messrs. J. C. Lyell and Co., 113, Great Portland Street, have offered to supply volunteers for military service with silencers for use on their machines at one half the usual price. It is necessary that a signed declaration that the machine is to be used for military purposes must be sent to the firm before silencers can be obtained. Special forms are issued, so that intending military motor cyclists can obtain these and fill them in as required.

Sharing the Work.

In order to keep as many of their hands employed as possible during the war, Messrs. W. and A. Bates, Ltd., St. Mary's Mills, Leicester, makers of the Bates tyres and belts, have decided to distribute the work as evenly as possible, and, furthermore, the directors will assist in helping the families of all their employees who join the Army and Navy, and will reinstate all such on their return.

"Honest Injun."

The Indian is the name of a chatty little publication issued by the Melbourne depot of the Hendee Manufacturing Co. It is profusely illustrated, and although one or two of its remarks of English trials are perhaps open to criticism, the whole publication is undoubtedly a very smart piece of advertising, in which our American friends are such adepts. It is evidently intended to issue this magazine monthly, as the one we have received is No. 2 of Vol. I.

Hard Tests for Rims.

We have received a pamphlet from the Roman Rim, Ltd., Upper Priory, Birmingham, dealing with the use of rustless Roman rims on motor cycles. These are not only rustless, but will stand almost any shock received without losing shape, a proof of which is furnished by Mr. C. R. Collier, who showed the company a rim on which the tyre had burst when travelling at seventy-two miles an hour at Brooklands. The rim remained a perfect circle, though it was, of course, considerably marked on the edge, due to its contact with the rough track.

For service swift and sure,

the mount we show you here is simply unexcelled—
That has been proved by riders everywhere, and the latest evidence is the selection by H.M. War Office of the

QUADRANT

4½ h.p. solo as a mount efficiently fulfilling all the exacting requirements of that department and capable of standing up to all demands which active service make upon it.
Note these items of its specification — 4½ h.p. Armstrong 3-speed Gear and Free Engine — Dunlop Tyres and Belt — Bosch Magneto — Senspray Carburetter — Quadrant Spring Forks — also the price, which is less by far than other Motor Cycles of renown.
And then — ask us for our latest folder.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

TWO Motor Cycle, 2¾h.p. Peugeot, mag., splendid hill-climber, and 2¾h.p. Bradbury, for higher power value at £25.—Davis, Greengate, Salford. [X0629

EXCHANGE 1913½ 4h.p. New Hudson combination and cash for 1914 Headee Special combiaation; sell £55, cost £85.—21, Rupert St., Bolton. [7711

SMALL Car in exchange for motor cycle and cash; cycle car chassis, 10/-; motor frame, 15/-; motor cycle, £4/10.—74, Upper Tooting Rd., S.W. [7690

9h.p. 2-cyl. Darracq, Bosch mag., hood, screen, Stepney, smart little car; exchange sidecar combination, cash either way.—P. Riddelsdell, Boxford, Suffolk. [7713

EXCHANGE 5-6h.p. 1913 Blumfield Twin and sidecar for 3 or 4-wheeled cycle car, or lightweight motor cycle, or sell £30.—Etruria, Tile Hill Lane, Coventry. [X0612

1913 8h.p. Matchless and sidecar, 2-speed, free engine, kick starter, all accessories, splendid condition; exchange for light car.—72, Perry Vale, Forest Hill. [7770

8h.p. Matchless, J.A.P. twin, 2-speed, with £16/16 sidecar, scarcely soiled; what offers, cash, or consider lower power and cash.—156, Ladypool Rd., Birmingham. [X0676

EXCHANGE 1914 Triumph, 3 speeds, Lucas head and rear lights, horn, Cowey speedometer, and coach-built sidecar, for Morgan runabout, or sell.—Asher, Wincobank, Sheffield. [X0520

NEARLY New Humher and Sidecar, 3½h.p., free engine, 2-speed, handle starting, for higher power, Enfield or Indian preferred, cash adjustment.—Apply, 194, Philip Lane, Tottenham, N. [7685

MORGAN Cycle Car, 8h.p. twin J.A.P. engine, lamps, speedometer, etc., in splendid order; accept £65 cash or motor cycle and cash to value.—76, Summerley St., Earlsfield, S.W. [7730

ARIEL, 1912, 3½h.p., 1913 engine, 3 speeds, free engine, semi-T.T. model, nearly new Dunlops, new belt, fully equipped, like new throughont, for lightweight, or sell £35.—Peat, 127, Treatham St., Southfields, S.W. [7773

TYPEWRITER, Remiagton (worth £10/10), Ellam's £10/10 duplicator, and one new gold-cased huoter watch, cost £2/10, and cash adjustment (if necessary) for good class motor cycle, genuine business.—E. W. Gaskin, 150, St. Saviour's Rd., Saltley, Birmingham. [X0673

A.C. Sociable (Model de Luxe), hood and screen, 2 Lucas side lamps, 2 P. and H. acetylene head lamps, with large generator, Dependence tail lamp, 1914 Senspray, horn, mirror, tools, etc., aluminium oumbers, recently overhauled, in splendid condition, any trial, for late model variable geared motor cycle and cash.—Stoak Farm, near Chester. [7619

REPAIRERS.

ANTOINE Cylindere, pistone, and parts; prompt delivery.

CYLINDERS, crank cases welded; quotatioos free.

COMPRESSION.—Cylioders ground and new piston fitted, 24/-.

OLDEST Engines restored to highest vitality.

COMPLETE Overhauls at lowest possible prices. Full stock of Rex, Triumph, and J.A.P. parts.

COUNTER-SHAFT Gears.—We can aow quote the trade for our Rex-J.A.P. 3-speed gear at inclusive prices, including fitting to old machines.—The Premier Motor Co., Ltd., Aston Rd., Birmingham. [0246

WHITTALL Machinists' Co., War Office Contractors, for all repairs.

WHITTALL.—Expert welders; repairs returned, accurately machined, inside 7 days. No charge if unsuccessful.

WHITTALL.—Re-horing and new pistons. All motor repairs. Old engines rejuvenated. All work guaranteed; no exaperating delays.—Whittall Machinists' Co., Whittall St., Birmingham. [0136

REPAIRERS.

MORGAN and Maxwell, Streatham, for cheap, quick, good repairs. [X0678

WELDINGS, Ltd., Dept. M.C., 235, Gt. Ancoats St., Manchester.—Oxy-acetylene welding experts.

BROKEN Flanges, valve seats, pistons, crank cases, water jackets, welded and machined complete.

SEND Your Old Engine or complete machioe for overhauling, re-bushing, cylinders re-ground, new pistons, rings, and gudgeon pins fitted.—Weldings, Ltd., Dept. M.C., Manchester. [6234

VALVES.—Nickel steel valves, any size, 3/6; per pair 6/-.—C. R. Foster, Kirkstall Rd., Leeds. [0253

REPAIRS.—Don't scrap your old body. Get our estimate.—Bright and Hayles, Church St., Camberwell. 'Phone: Hop 50. [7707

CYLINDERS, Crank Cases welded; quotations free; send your enquiries.—Premier Motor Co., Aston Rd., Birmingham. [0248

OXY-ACETYLENE Welding, first-class work; moderate quotations.—Purcells, 78, Charlotte St., Tottenham Court Rd., W. [6750

CRACKED Cylinders; castings, forgings, etc., successfully repaired by Lea's metallurgical process.—Lea, Engineers, Runcorn. [5197

WELDING.—All metals, cylinders, and crank cases. We have the plant, experience, and method for every job. Quick delivery.—Below.

CYLINDERS Re-ground, new pistons fitted, complete with rings, etc.; 22/6.—Oxy-Acetylene Welding, 349, Lillie Rd., Fulham. 'Phone: Hammersmith 1617. [6430

WELDING.—Broken cylinders, flanges, pistons, crank cases repaired and machined; worn valve seats built up, cracked seatings welded and machined.

CYLINDERS Re-ground, new pistons fitted complete, worn parts duplicated.—West London Welding Co., Essex Place, Chiswick. Tel.: 536. [7104

MINERVA Spares, cylinders ground, pistons fitted, rebushing, parts duplicated.—Ellenborough Motor Works, Ellenborough Rd., Wood Green, N. [8394

CCCCCCCC Cylinders Re-bored, new pistons fitted, bear 13 stone on compression.—Gradior Machine Co., Compression Specialists, Stafford. Est. 21 years. [7314

PISTON, fitted with top and bottom, step-cut rings, hardened steel gudgeon pin, and your cylinder rebored and ground, 24/-.—C. R. Foster, Kirkstall Rd., Leeds. [0310

REPAIRS.—Now is the time to have your motor cycle overhauled. All kinds of repairs at lowest prices.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., opposite Olympia, London. [7634

UNBREAKABLE Chrome-nickel Valves.—Numerous testimonials prove superiority. Guaranteed one year. Any make, 3/6 each, 6/- pair, free per return.—Capacity Tool Co., Broseley, Shropshire. [X0693

CYLINDERS Reground, fitted with new piston, hardened gudgeon, and step-cut rings, 85 mm., 21/-; overhauls, re-bushing, estimates free.—The Motor Repair Co., Stretford, Manchester. [X0716

TONGE Welding Works, 174, Oldham Rd., Middleton, Manchester.—Experts in broken cylinders, crank cases, etc. Welding aluminium a speciality. Nothing too difficult. Sound work at moderate charges. [1389

COMPRESSION.—Cylinders re-bored and ground, new pistons, rings, and gudgeons, complete, 16/-; overhauling, re-bushing, efficiency guaranteed.—Reliance Motor Engineering Co., Spon Lane, Smethwick, Birmingham. [7282

LOWEST Prices Quoted for any repairs or complete overhauls to motor cycles, cycle cars, or cars, or work done on the premises and fully guaranteed; cylinders cleaned by oxygen process, 2/6 single, 4/6 twin.—Maudes, 136, Gt. Portland St., W. [7348

SERVICE Reliable Repairs and Overhauls.—We will do your work at specially reduced prices during the war. Up-to-date and well equipped workshops, skilled mechanics.—1 and 2, Harpur Mews, Theobalds Rd., W.C. Offices 292, High Holborn. 'Phone: 260 Central. [7185

F.N. Owners Note.—W. Earl, late foreman at the Highhury repair works, is at your disposal for all repairs. Our special engineering plant and the personal attention of a recognised F.N. expert will ensure best results at minimum expense.—Below.

F.N. Spares, special announcement.—We have a large stock of new, also sound second-hand parts. If unable to obtain certain replacements please consult us.—Below.

3-SPEED Gears for any model 4-cyl. F.N., converts your F.N. into a first-class passenger machine. We are the sole manufacturers of this gear and also the new type Horstmann 2-speed gears. Note special low prices during war period; particulars gladly on application.—Earl's Engineering Works, 5, Heath St., Hampstead. [X0762

WAR.—To keep our factory going full time we will do your repairs at practically cost. Our well-known high standard of excellence will be maintained. Every job will bear our full guarantee. The sole difference will be the prices, which hold only during the crisis; our ordinary rates will be charged as soon as normal times return. Cylinders re-bored, ground, fitted new pistons, rings, and gudgeon, 15/6; re-bushing, overhauling, welding, frame alterations, etc., all at cost. Send jobs along at once. You will be thoroughly well satisfied in every way.—Tennant Engineering Co., Pershore St., Birmingham. Official repairers to A.C.U. [X0685

Activity in the Motor Cycle World.

Value of British August and September Exports of Motor Cycles and Parts. } **£140,996.**

PERHAPS the most signficant and reassuring outlook in connection with the motor cycle industry since the war began is the figure given above, representing the value of exports of British-made motor cycles and parts during the two complete months of the war. We have been told that our Overseas trade would be paralysed owing to the risks and difficulties in regard to shipping, but so far, at any rate, our exports have not been materially affected. The figures are down, of course, but not nearly so much as might have been expected. Last year during August and September we exported motor cycles and parts to the value of £146,218, so that this year's figures for the corresponding period represent a decrease of only £5,222, which amount, it must be admitted, is remarkable for a country in a state of war, and it is a further testimony to the efficiency of the British Navy.

Imports have been a good deal more affected, but nevertheless Great Britain was able to take foreign motor cycles and parts to the value of £15,855 during the two complete months of the war, of which £6,278 represents September.

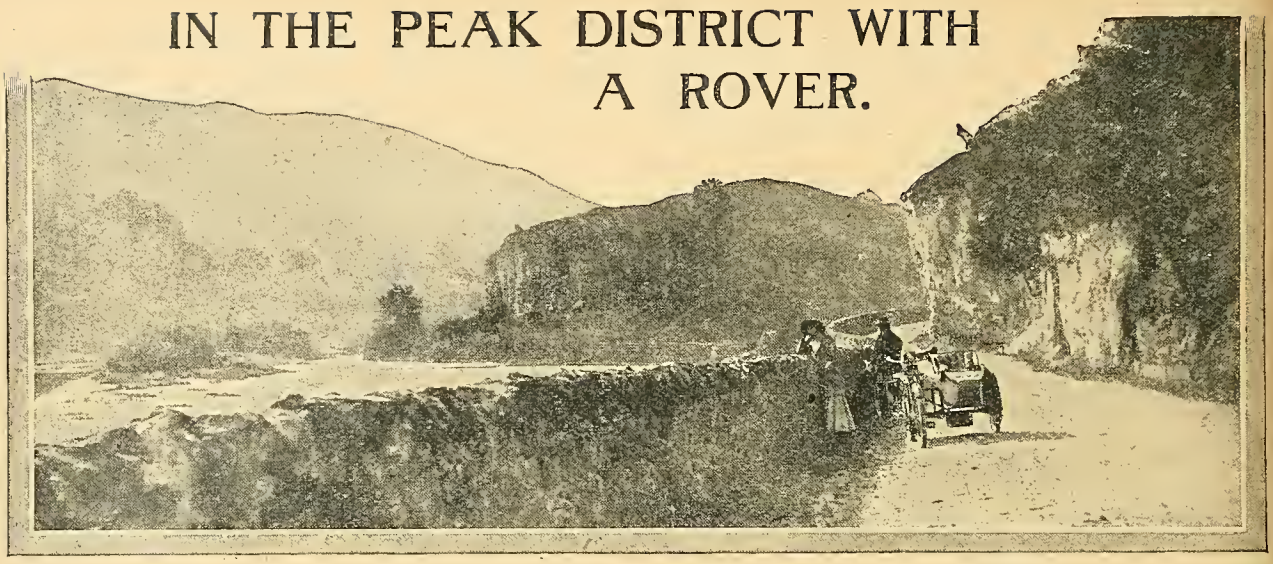
But everything points to more normal conditions being attained. The country is rapidly recovering from the shock of the war, trade in all directions is reviving as people become accustomed to war conditions, and, with the termination of the Moratorium, money is being spent more freely. Factories in most cases are in full swing, some are working all night on Government orders, and, in short, our readers in out-of-the-way corners and Overseas dominions would, we are confident, be agreeably surprised to see with their own eyes the state of activity in the motor cycle world in England. 1915 models are well in hand (indeed, the pages of *The Motor Cycle* with descriptions and illustrations are proof of that fact), and though in some cases a certain amount of delay has been occasioned by the war, it is expected that the majority of makers will have definitely fixed their plans within the next month, and be in a position to make their usual announcement respecting new designs at Show time. As there is to be no Show this year, our annual Buyers' Guide, to be published on November 19th, will fill the breach.

The Control Question.

OUR crusade for the standardisation of controls is progressing. The necessity of this is admitted on practically all sides—it could hardly be otherwise—but there are certainly some difficulties in the way, for at present some riders prefer their levers to open outwards, and some in the reverse direction; some prefer the brake to be operated by the right foot, others would rather use the left, and the two-footed brake certainly has great advantages. Again, some brakes are worked by the heel and some by the toe. In the matter of clutches, too, there is diversity of opinion, but the handle-bar control is gradually gaining adherents, while on some few machines control can be exercised by both hand and foot, as may be most convenient at the moment.

We print in our correspondence columns some letters on this important subject, one being especially interesting, as it points out that the Engineering Standards Committee have a sub-committee at work on the question of standardisation of controls of motor cars, and from this it is but a short step to similar agreement in the matter of motor cycles; in fact, on the whole the motor cycle question is the simpler of the two. Of course, any universal rule on the subject must mean a certain amount of trouble for the minority, but this cannot well be helped, and the advantages certainly outweigh any inconvenience caused to individuals.

IN THE PEAK DISTRICT WITH A ROVER.



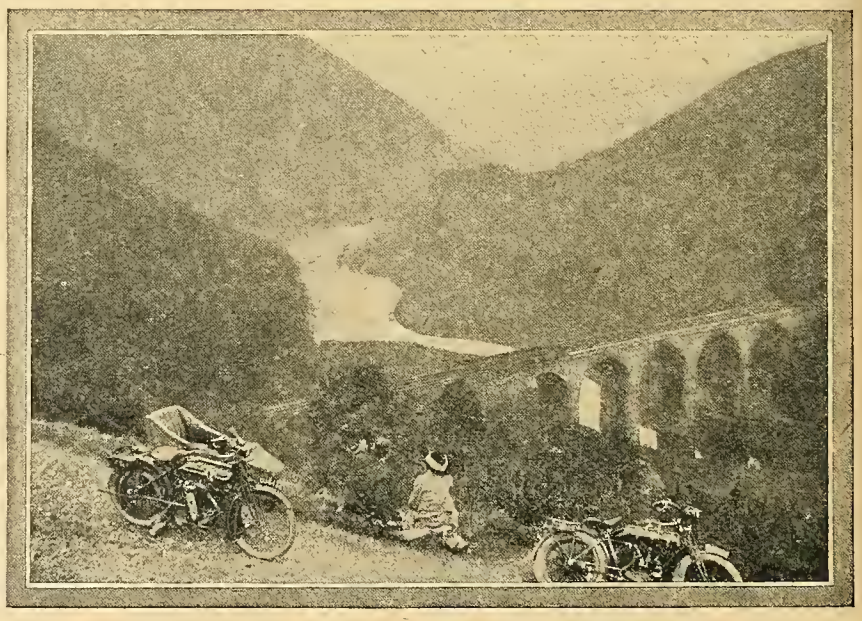
WE wonder how many motor cyclists who regularly tour abroad have penetrated into the regions of the Peak District? Whenever it is our pleasure to journey that way we are always constrained to remark upon the grandeur of the scenery, and the beautiful effect of hills and dales in that district. It was the writer's privilege only a few weeks ago to journey to the South of France by road, and he does not hesitate to state emphatically that for the first three hundred miles there was no scenery encountered which could compare for one moment with that which can be enjoyed at home.

During the last few weeks we have had the good fortune to have a 3½ h.p. Rover sidecar outfit placed at our disposal for the purpose of an extended trial, and a holiday approaching, the machine was used for a short tour among the hills and dales of the High Peak District of Derbyshire, in company with a camera. The Rover placed at our disposal drew forth praise at the outset, for with the thoroughness characteristic of the Rover company, the machine was equipped in every detail, complete with lamp, horn, and all tools, and even possessed a spring carrier for a touring valise, and another carrier under the sidecar axle for the transport of a two-gallon tin of petrol. Here was a good start, at any rate.

Having occasion to visit the Midlands before proceeding to our headquarters in the Peak District, we renewed our acquaintance with the fine Fosseway to Newark, then branched to the left over the Trent, leaving the ruins of the castle to our left towards Mansfield and Chesterfield. Despite the prevalence of a fairly strong head wind, the Rover got along very well, though it seemed rather too highly geared on top in view of the elements, and showed signs of slight overheating from time to time. It is a curious thing that both a low and high gear can produce overheating, and, if anything, an engine which is overgeared, or, in other words, overloaded, will heat up quicker than if geared on the low side. The machine, however, ran with the regularity of a train, and we reached our journey's end well satisfied with the first impressions of the Rover outfit on the road.

Excellent Brakes a Feature of the Rover.

For a week the machine was used as a hack in visiting the different dales and notable spots in the High Peak, the Rover always responding to our beck and call, and requiring the minimum amount of attention. We need not dwell upon the ordinary runs referred to, for the camera will testify to the beauty of the points



MONSAL DALE, A WELL KNOWN VIEW IN THE PEAK DISTRICT
The machines are a 3½ h.p. Rover sidecar outfit and a 2¾ h.p. Humber.

In the Peak District with a Rover.—

visited. One morning we spent at Monsal Dale and Littonslack watching the antics of a friend attempting to get his lightweight up the 1 in 4 gradient which had caused such a high percentage of failures in the A.C.U. Six Days Trials. Littonslack is a most deceptive gradient; indeed, it is only possible to get a true idea of its steepness when a machine has got to the summit, and it is desired to get it to the bottom again. It needs the finest of brakes to hold any machine on such a slope, and there is no doubt that the descent is more of a task than a clean ascent on a machine of the go-anywhere type.

In this connection, a word as to the Rover brakes may not be out of place, for they were most powerful in action, and did not require adjustment on any occasion. The foot brake is interconnected with a band brake on the sidecar wheel, and has a compensating action, and, contrary to general expectation, the steering was not affected when the sidecar brake was applied either with or without the front rim brake.

Minor but Important Details.

The Rover regularly covered 65 m.p.g. with its B. and B. carburetter, which must be considered extremely good, and while on the subject of carburation, it may be recorded to the credit of this machine that the handle-bar levers will remain where they are put, and not jolt open or closed, which is an all too common occurrence with standardised handle-bar levers on even the best of modern mounts. The detail work generally calls for admiration, and the large glass-topped filler caps serve their purpose excellently, and are a most useful guide to the amount of fuel remaining in the tanks.

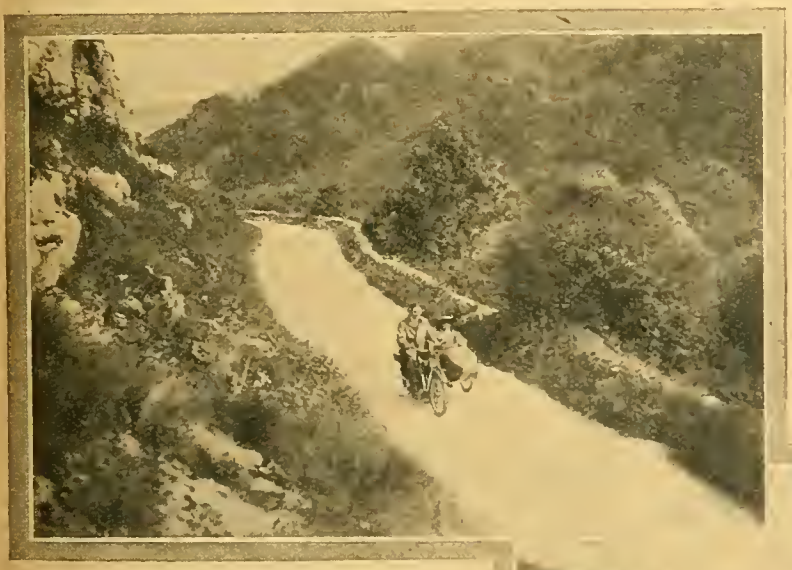
The silence of the cam and valve gear on the Rover has more than once been referred to in these pages, but as it is such an excellent feature, which unfortunately cannot be applied to every leading make, we feel that this is a point on which the Rover cannot have sufficient credit.

The admirably efficient method in which the designers have silenced the exhaust gases without creating undue back pressure, combined with the cam and valve gear already alluded to, render the 3½ h.p. Rover one of the most conspicuously silent machines on the market, and as such is bound to find favour with a large section.

Slogging against the Wind.

Perhaps the finest performance of the Rover was a hundred mile journey mostly covered after 4 p.m. First starting from Bakewell along the Leek Road in an opposite direction to home, we called at Chelmorton, near Buxton, which village is reported to possess not only one of the most lofty but one of the oldest churches in England, and a very fine relic it is. Here we were 1,200 feet up. We headed for home at 4 p.m. with a howling gale blowing over the moors, consequently the middle and low gears were frequently called upon. After plodding along against wind and gradient, the engine began to show signs of feebleness, and a halt for inspection revealed the fact that the exhaust valve had lengthened and destroyed the compression in the engine. It was the work of a few moments to adjust the tappet to give a clearance of the thickness of a visiting card, and so restore the pristine vim. We were heading for Taddington, on the main Buxton-Derby road, as the most direct route to Coventry. At Taddington there is a two-mile drop towards Bakewell, and it was only necessary to apply the brakes judiciously on the corners to check the speed in a silent swoop down this noted hill. The wind, too, now favoured our course, and consequently an excellent average was maintained.

We passed through Matlock about five o'clock, and such progress did we make that it was not necessary to light up until we got to Ashby-de-la-Zouch, only thirty-three miles from our journey's end, but lighting up was easier said than done, as the brand new tail



Views in Millers Dale, near Litton Mills.

In the Peak District with a Rover.—

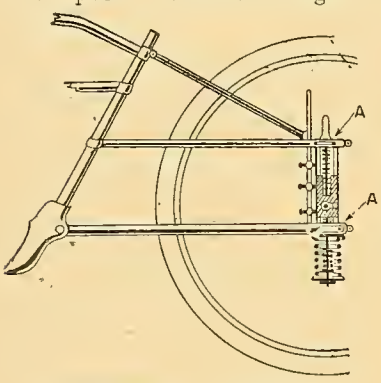
lamp burner was found to be choked and nothing in our possession was fine enough to clear the stoppage, nor could one or two motor cyclists whom we encountered help us. Moral, carry a piece of fine wire. We thought of removing the burner altogether and turning the generator on more, but the flame which occasionally shot out of the lamp gave cause for alarm, so there was nothing for it but to risk being stopped by the police, but we were in luck's way, for we managed to complete the last stage of the journey and escape the vigilance of the law.

Throughout the run the machine had given no trouble, the Dunlop tyres and belt sharing in the general excellence of the turn-out by calling for no attention whatever. But for the necessity to adjust the tappets the toolbag and its contents might have been left at home. G.S.

A view from Taddington Moor.

A Rear-sprung Mount.

THE accompanying illustration shows the construction of a motor cycle frame adapted to employ one form of the Palmer patent rear suspension. The patent shock absorbers are slid into special fork-ended lugs A A, and are adjustable backwards and forwards. The horizontal rear stays (upper and lower) are joined together towards the rear, and just short of the slots in the lugs A by straight upright members. There are three adjusting set screws passing through reinforcements at intervals on the upright connecting members, and these impinge upon the slide rod of the absorber mechanism, providing the possibility of firmly fixing the absorbers at any desired point of their backward or forward adjustable movement in the lugs A. The full force of all road shocks is dealt with by three independent coil springs on either side of the rear wheel. One of the lower springs is a large diameter strong coil from 3½in. to 5in. long, while within it and closely encircling the downward extension of the central steel slide rod is a short length of spring, which is independently adjustable upwards or downwards upon this rod. This last spring comes into action only in cases where the shocks are of such intensity as to compress the upper and lower main springs to a previously determined point.

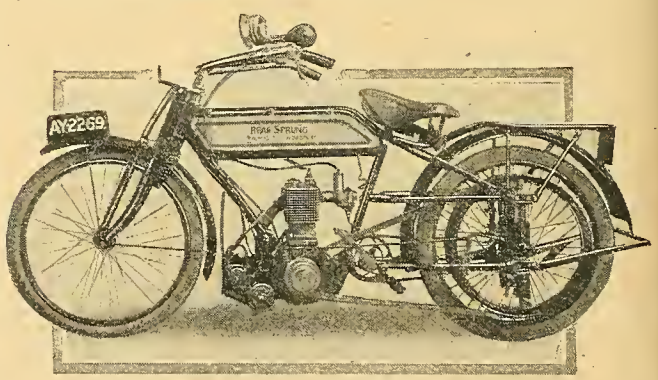


Diagrammatic sketch of Palmer rear suspension.

It will be seen, therefore, that the shock-resisting power of the springs in this type of suspension is automatically reinforced as called for by the conditions of surface traversed, and also that sufficiently resilient springs for comfort when negotiating normal surfaces are not, as in many cases, too weak, when bad potholes and exceptionally rough roads are being encountered. There is claimed to be no side play or sense of lack of rigidity sideways, and that the life of the rear tyre with this suspension is greatly prolonged.

A rider who uses this suspension on the rough roads of Holland confesses that he would have been compelled for physical reasons to have abandoned the motor cycle as a means of travel entirely had he not fitted to his 2¾ h.p. machine this cushioning device.

The suspension can be supplied in bracket form capable of being fitted to existing machines or embodied in machines of standard design. The patentee hopes that this springing device will be taken up by makers of rigid frame machines.



A rear-sprung motor cycle described on this page.

THE VALUE OF THE MOTOR CYCLIST IN WAR.

We continue to receive excellent news concerning the motor cycle despatch riders serving with the Expeditionary Force. A daily paper, which at the beginning of the motor cycle movement was hostile to the pastime, has now published a photograph of a group of motor cycle scouts with the superscription, "An effective arm of the Service."

By appointment to *H.M. King George V.*

War service

corroborates the wonderful wear-resisting qualities of Dunlop motor-cycle tyres.

Albany Road Hospital, Cardiff.
September 23rd, 1914.

"I should like to say how much I appreciated Dunlop tyres out in Belgium and France. I am a motor-cycle despatch rider, and was one of the first to go to the front. I covered well over 2,000 miles in three weeks and only had one puncture. The roads in Belgium were some of the most fiendish imaginable, and I frequently rode across fields of stubble and tracks of all descriptions. This shows that Dunlop tyres are the best and wear the longest, for active service is a sure test of endurance and fitness.

I was invalided home and am now convalescing here."

(Signed) Corpl. J. K. STEVENS, R.E.

The capacity for hard wear of Dunlop motor-cycle tyres is unique, and is the result of an important development in tyre construction.

AGENTS EVERYWHERE.

Cheap Machines often Poorly Equipped.

The other day I sampled one of the cheap lightweights, as delivered to a customer. A few miles out the back tyre deflated, and I made the pleasing discovery that this model is not provided with either a tyre pump or tyre repair outfit, whilst the tool equipment is exceedingly meagre. For example, it does not contain a pair of pliers, and as the locknut of the tyre valve had been tightly screwed up, and was half jammed against the belt rim, I had to knock it round with a screwdriver and spanner.

Engine Repairs.

Switching off delivery tune for the moment, I desire to call the attention of departmental managers to the need of reform in many repair shops. I shall not fill my column with a lot of evidence unless I am pressed to do so, but my information proves that the system in vogue at many factories is as crude as one could imagine. Here are two recent cases: an engine was returned because the owner was troubled with intermittent noises; it came back with the trouble untraced and uncured, but flanked by an imposing bill. I found that a roller in an engine bearing was damaged, and that the factory had merely sent the machine out with a tester, who reported that he could trace no noise, but had ground in the valves and devoted some minor attention to the magneto. The correct system would surely have been to write the owner, informing him that a tester could not perceive the alleged noise, and that a certain fee would be charged if the owner was so positive that he desired the engine to be taken down. In another case, a piston was smashed. The repair shop fitted a new piston, but never inspected the cylinder, which had been badly scored by the gudgeon pin. In both cases the owner has to send his machine on a second journey of some length at considerable expense. In some of the cases brought to my notice, the personal factor has obviously been to blame. An inefficient mechanic has somehow or other wormed his way into a responsible position, and the firm suffers for his faults and their own slowness in testing their men. If I managed a repair shop and I had to place a new hand in a responsible position, I should take very good care that his first tricky job was thoroughly supervised "unbeknownst" to himself. In other cases the system is faulty. Wherever an owner complains of engine trouble, the entire engine should be dismantled by a trustworthy man, for trouble in one detail of the engine is so apt to affect other details, such an engine should not leave the engine shop till it has been submitted to a short bench test. In other words, the average running shed is a very casual and irregular sort of department. At one and the same time, experimental machines, competition machines, directors' machines, brand new machines for urgent delivery, and old machines of countless different dates and types are undergoing a variety of repairs, tests, and adjustments. A machine sent for repair after 10,000 miles by a customer residing a hundred miles away requires more than a casual inspection and ten-mile trip in the hands of one of the testers. Its engine should invariably be removed, sent through the engine shop, and be passed by the head of the engine repair room before the machine is returned to its owner. I cannot emphasise these points too strongly. On two occasions I let myself be coaxed into returning my machine to the factory before an important competition; and in both cases it came back in a condition far inferior to that in which it had quitted my own shed, and very considerably inferior to the "tune" which I could have produced by a day's hard work on my own.

A Rudge Refinement.

I have long been watching for some small invention which should raise the Rudge-Multi gear to the hill-climbing level of such gears as provide a 13 to 1 bottom ratio in emergencies. The Zenith people have already dodged the hoodoo of infinitely variable pulley designs by mounting their gear as a countershaft, which drops their emergency ratio from 7 to 12 at a step. On page 310 of our issue of September 3rd we printed details of a new Rudge patent which appears to me "the goods." A very simple epicyclic reducing gear is embodied in the hub shell, the crankshaft multi pulley and variable belt rim being retained. This gear is plainly better than a design limited to three arbitrary ratios. To begin with, the usual series of ratios, all direct and practically frictionless drives, are retained without employing the epicyclic hub, and the series range from, say, 3½ to 7. When a precipitous hill is encountered, a second infinitely variable series is switched into operation by the use of the epicyclic hub, and if this hub affords a reduction of 50%, the secondary series would range from 7 to 14 to 1. The design has extraordinary merits, as follows:

1. Any gear between 3½ and 14 to 1 is instantly obtainable without a stoppage.
2. On the emergency ratios of 12, 13, and 14 the friction of only a single epicyclic train is encountered.
3. The hub is extremely simple.
4. The intermediate ratio of 7 to 1 is direct, instead of indirect as on the three-speed hub.
5. If the expanding pulley should become deranged, a 50% reduction low gear is still available.

I am vastly in love with the design, and my only wonder is that so shrewd a factory should have been so long in finding a solution. Methinks the Rudge and Zenith must now be seriously reckoned with in the forthcoming battle between opposing gear designs. I hope the new patent will figure on the 1915 Rudge-Multi models, but I received no encouragement in response to a query I made.

NOISY MOTOR CYCLES.

Another Point of View.

THE article by "Engineer" on the silence of motor cycles in the issue of October 1st was particularly interesting, and has doubtless been appreciated by that vast majority of motor cyclists who prefer a comparatively silent machine. While the end he has in view is both desirable and necessary, the means "Engineer" suggests to attain this end are largely open to criticism.

The question of silencing the exhaust has received the closest attention of present day manufacturers, and, as a result of their efforts, the motor cycle of to-day is silent enough compatible with safety.

The practice, which appears to be almost universal, of a long exhaust pipe leading from a large expansion chamber, seems to be satisfactory, although a greater degree of silence might be gained if the exhaust gases were diffused more gradually.

Valve clatter seems to be a fault which has not had the same consideration at the hands of manufacturers. Larger valves and smaller valve lift certainly are worth consideration, but the suggestion of fibre topped tappets is certainly open to criticism. Owing to quick wear, they would need continual adjustment, and it must not be overlooked that the manufacturer has to cater for all classes—the average motor cyclist could not pretend to be continually adjusting the valves of his machine. It seems that the question is one of the actual composition of the steel used for tappets, and this seems to be proved by the comparative silence of the valve gear of certain machines.

The adoption of the completely enclosed mechanically-operated overhead inlet valve, with its numerous other advantages, is to be recommended.

The subject of transmission is indeed a vexed one, and there is no need to reiterate the old arguments in favour of either belt or chain drive. What is much more convincing is that for all high-class passenger machines, almost without exception, chain drive throughout has been adopted, and at the same time a silent transmission has been evolved, especially in the case of all enclosed chain drives. Whether shaft or chain drives will become universal is a matter which is open to question, but in either case hub gears will not find favour.

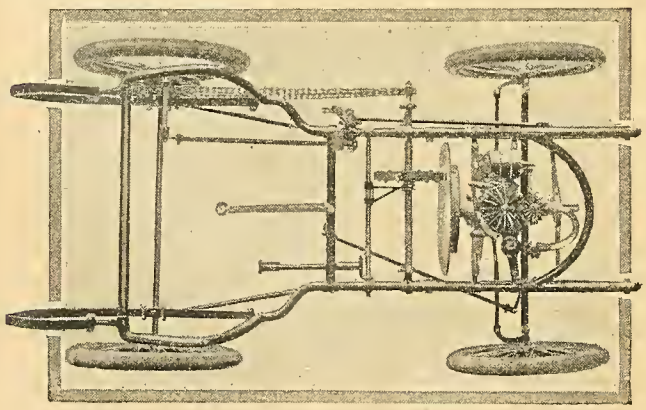
Back wheel accessibility is a serious consideration, and it is doubtful if any lessening of noise caused by the adoption of hub gears would compensate for an inaccessible back wheel. A counter-shaft gear box with accurately cut gears can be made almost silent, and, in conjunction with a silent chain from engine to counter-shaft with a shock-absorber of the Sunbeam type and a chain of generous dimensions as the final drive all totally enclosed, would form a practically silent transmission. At the same time, the back wheel would be as accessible as it is possible to be, and the distribution of weight would be more correct.

The ingenious shock-absorbers fitted to the majority of chain drivers impart a velvety softness to the chain drive, making it almost as supple a drive as the belt, and at the same time rendering a separate counter-shaft clutch unnecessary.

While much remains to be done in the evolution of the ideal passenger machine, there are several machines made, such as the Matchless, Scott, Sunbeam, Indian, and Enfield, all of which are silent enough in all conscience, and prove that to obtain a silent machine it is unnecessary to resort to undurable tappets and hub gears with separate counter-shaft clutches and the unreliable belt drive. W.S.

Cycle Cars of the Past.

IF any further proof were needed of the fact that the cycle car was one of the earliest motor conveyances instead of quite a late development a reference to a few ancient catalogues would convince the most hardened sceptic. For instance, we have a copy of the Maurer-Union catalogue for vehicles made twelve years ago. It illustrates, among the many types, a two-seater, the chassis weight of which was just 3½ cwt. A 3 h.p. single-cylinder air-cooled engine was carried in the front of a tubular frame, and drove a counter-shaft through friction gearing in the usual manner. The final drive was by a single chain to one rear wheel, on which the brake was mounted. Steering was direct, either by wheel or lever, and the friction wheel was moved laterally to change the gear ratios by means of a fork mounted on a screwed shaft behind the counter-shaft. It is interesting to note that a low-tension magneto was used, and pneumatic tyres and wire wheels were fitted all round, while one slightly larger vehicle (a 4 h.p. water-cooled model) is illustrated with a spare wheel complete. Thus we find in this old machine an intelligent anticipation of events. This, of course, is only one of a number of vehicles made many years ago, from the earliest 3½ h.p. Benz and the 4½ h.p. De Dion *vis-à-vis*, all of which would come nowadays under the A.C.U. definition of a cycle car. Despite their rather crude design, many of these old machines gave excellent service over long periods.



A simple cycle car made at Nuremberg twelve years ago.

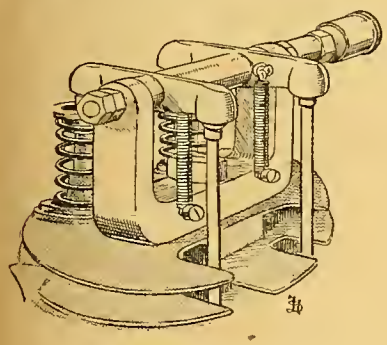
Advance Descriptions and Illustrations of 1915 Model Motor Cycles and Accessories.

SINGLE-CYLINDER RACING IVY.

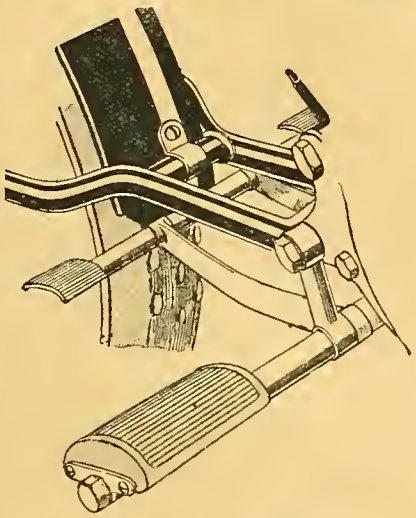
A RECENT visit to the works of Mr. S. A. Newman, the maker of the Ivy, proved of great interest. Howard Newman, who is so well known to all keen motor cyclists, both on Brooklands and in competition work, is serving his country in France.

First of all we inspected the mount which Newman was to have ridden in the Grand Prix, and though this is not to be a standard model, it is such a perfect little racing machine that a few words on the subject may prove interesting.



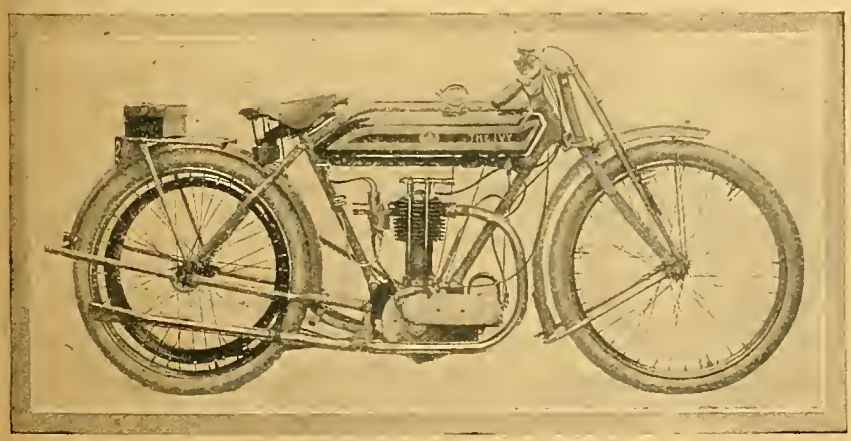
Overhead valve gear and greaser on the Precision racing engine.

The engine is a 2¾ h.p. overhead valve Precision, with a bore and stroke of 70 × 90 mm. respectively. The radiating ribs are deep and well arranged, and the rockers are mounted on a spindle through which grease can be forced from a large greaser at one end, so as to minimise wear and rattle.



Double heel brake on the Grand Prix Ivy.

The Brampton variable pulley gear is employed with a direct belt drive. Ivy spring forks are, of course, fitted, and the neat general lines can best be judged from our illustration. Both tank filler caps are 2½in. inside diameter, and oil is fed through a drip feed tap. The rear brake is exceptionally powerful and is operated by a double heel pedal in such a manner that all the rider's weight may be thrown on it at a moment's notice if necessary.

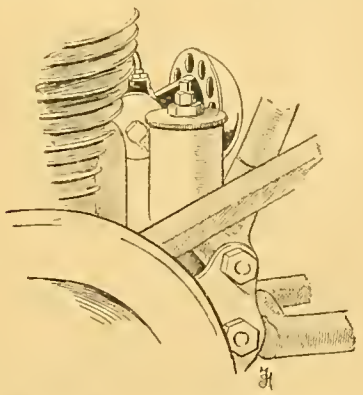


The single-cylinder Ivy racer which Howard Newman was to have ridden in the Grand Prix Race.

STANDARD TWO-STROKE IVY FOR 1915.

Enquiries about the two-stroke led to an offer of the new modèle de luxe on trial, and it was not long before we were astride one of these comfortable little machines. By the way, the Ivy two-stroke is made entirely in the Ivy works, two sizes of engine being manufactured, one of 70 × 70 mm., and one of 64 × 70 mm. It was the smaller of these two that was fitted in the machine we had on trial, but in spite of the fact that it was single geared (4⅞ to 1) and thoroughly equipped, it was capable of taking a rider over any average road.

The fittings are wonderfully complete, and the 26×2¼ tyres and large pan saddle are a luxury to which one is seldom treated on a light machine. Besides this, two stands, excellent mudguards, pannier tool-bags, and a large petrol tank make the Ivy de luxe one of the most sensible lightweights we have ever handled. The riding position is excellent, and the engine flexible and so easily handled



Neat carburetter position and air intake on the Ivy two-stroke.

that we felt at home on it in a minute, even in thick Birmingham traffic. The Bull Ring was proved much too easy a test, and on the road to Coventry, Meriden Hill was taken at a speed which it may be better not to mention. Comfort, power, flexibility, and neat appearance are all special features of this little machine, which may be fitted with a two-speed counter-shaft and three-speed hub gear, in which case the machine would be capable and comfortable for long touring in almost any district.

The maker of the Ivy has not made the mistake of adopting flimsy and toy-like parts on his machine; instead, it is built to stand hard wear. It is very silent as

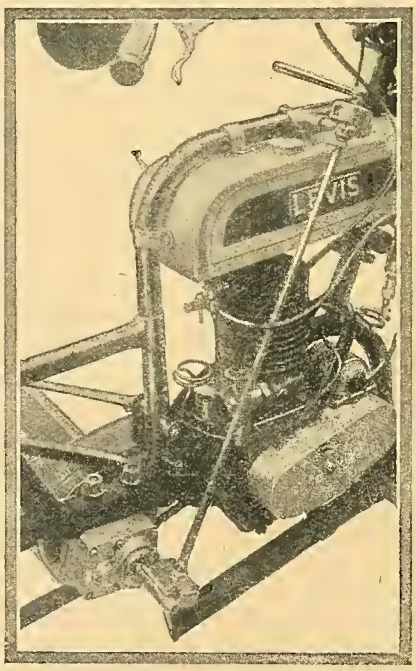
two-strokes go, and the metallic sound we recently dealt with in connection with two-strokes was practically non-existent. We took a great liking to the khaki-coloured Ivy during the week it was in our possession, and it entirely confirmed the good opinion we had formed of it after its performance in the Junior T.T. Race.

A LIGHTWEIGHT THREE-SPEED GEAR.

A TINY three-speed counter-shaft gear, which rather suggests the possibilities of the folding pocket motor bicycle, was shown to us last week, fitted to a Levis. The dimensions of this miniature gear box are 2½in. deep × 3⅜in. broad, and it weighs but 7¾ lb. all complete with its operating mechanism and 6in. driving pulley.

This new gear has been tested by the Levis Co., and is recommended by that firm for attachment to existing machines of their manufacture. It will fit all Levis frames since 1912 without structural alteration, and it can be adapted to the counter-shaft of most other lightweights by the use of an adapter plate. The gear is manufactured by Messrs. Jonah Banks and Sons, London Works, Willenhall, and is designed for chain-cum-belt transmission. No dog clutches are used, and the wheels are always in mesh. The gear change is effected by a steel collapsible key carried in a plunger, which is capable of being traversed along the hollow main-shaft by means of a rod housed in an extension of the gear box. As this key registers with one of the three keyways cut in each of the three gear wheels, it is forced outward by the action of a spring, and that gear wheel is locked to the driving-shaft. The sprocket and driving pulley are mounted side by side on the hollow shaft, which has a solid extension at one end of smaller diameter. On this latter portion the sprocket is mounted, the belt pulley being fixed to a hollow shaft which is solid with the first gear in the box. Between each gear wheel there is mounted a steel ring washer with a row of steel balls between the face of each gear wheel. The top corners of the operating key are bevelled off. Thus, on the plunger being moved in either direction the bevelled edge of the key abuts against the rounded off inner surfaces of the steel rings, and the key is collapsed flush with the surface of the hollow main shaft, thus allowing the gear to revolve independently of the main shaft. Further movement given to the plunger allows the key to slide along and engage with the first keyway presenting itself in the adjacent gear wheel. The drive is then taken on to the corresponding wheel mounted on the solid layshaft, and conveyed in the usual manner to the main driving gear which carries the belt pulley. The ratios provided are 6, 9, and 12 to 1, and a clutch may be fitted if desired.



A tiny three-speed gear fitted to the bottom bracket of an open frame Levis. This new gear is made by Jonah Banks and Sons, and is described on this page.

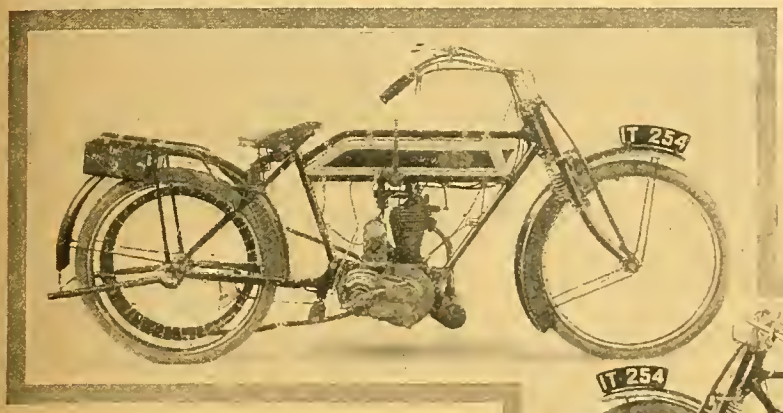
We tried the gear on a two-stroke Levis machine, and found that it was possible to change up and down without hesitation, and without even touching the throttle or valve lifter. Mr. Faville, who demonstrated the gear on behalf of Messrs. Jonah Banks and Sons, went so far as to make a standing start by moving the gear into the first position with the engine roaring round. This sort of treatment is not to be recommended, as something or other is bound to go sooner or later, but it shows the confidence the makers have in their product. A slight humming noise emanated from the wheels on the two lowest gears, but it seemed capable of withstanding really rough usage. The change is effected by a lever with a lateral movement, but future gears will have the more orthodox backward and forward movement.

NEW J.H. MODELS.

WE illustrate on next page two interesting lightweight machines called the J.H., which are being introduced by Mr. James Howarth (formerly manager of the Bradbury Company), at the J.H. Motor Engineering Works, Oldham. The general details of the machines are very similar: both are fitted with B. and B. carburetters, Dunlop belts, Dunlop or Palmer

Latest Designs.—

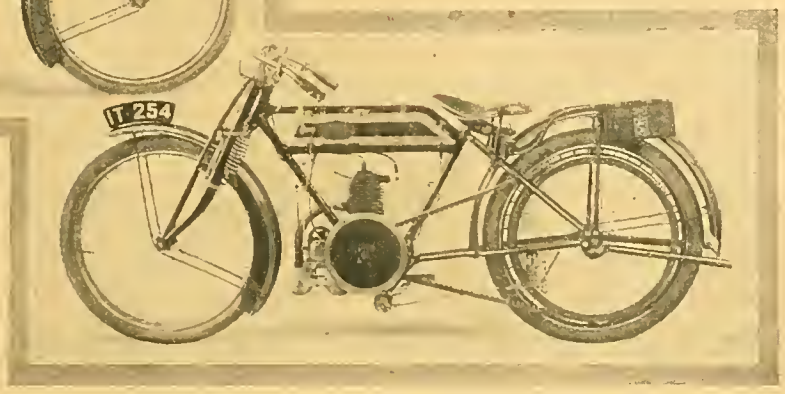
tyres of 2in. section on 26in. wheels. Respecting the engines, No. 1 is fitted with the Villiers 2¾ h.p. power unit, comprising a four-stroke engine, 74½×80 mm. bore and stroke, 349 c.c., and a change speed gear carried in an extension of the crank case, giving ratios of 5¼ and 10¼ to 1, the gear wheels being always in mesh, and provided with a friction clutch of the cone type on both speeds, operated by a Bowden wire from the handle-bar. The gear lever is carried in a convenient position to the right hand side of the tank. With the exception of the driving pulley the whole mechanism is enclosed in an aluminium case, through which there is a complete circulation of oil. The transmission is by silent chain to the two-speed gear and thence by a ¾in. belt. The price of this model is forty-four guineas.



The 2¾ h.p. J.H., showing gear control lever and clutch-operating pedal.

Our second illustration shows the 2½ h.p. two-stroke model, which sells at twenty-eight guineas; the engine is the well-known Villiers two-stroke, 70 × 70 mm. bore and stroke, 269 c.c., and is provided with a double silencer, rendering it comparatively silent. The lubrication is on the "petroil" system, and the magneto, a U.H., driven by an enclosed chain. The tanks hold about 1¼ gallons of petrol and two pints of oil. It is claimed that this machine can be driven at a walking pace up to 35 or 40 m.p.h.

Mr. Howarth caters for all tastes, and other models are fitted with 6 and 8 h.p. J.A.P. and 6 h.p. M.A.G. engines and three-speed gears. They are listed at seventy and seventy-two guineas, and are well suited for sidecar work.

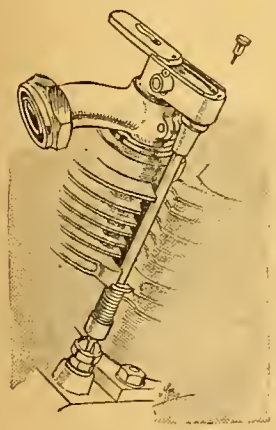


Belt side of the new 2½ h.p. J.H. two-stroke model.

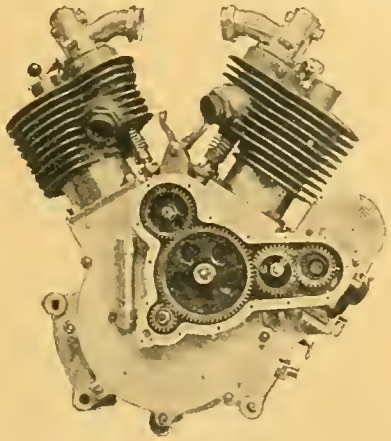
1915 BROWN MOTOR CYCLES.

A NEW 4 h.p. TWIN AND A NEAT TWO-STROKE LIGHTWEIGHT.

WE recently had an opportunity of inspecting two new models which Messrs. Brown Brothers are introducing for 1915. The larger machine is fitted with a beautifully made V-twin engine of 3½-4 h.p. As the bore and stroke respectively are 63 × 83 mm., the engine comes just outside the 500 c.c. class, being actually 518 c.c. It is, however, powerful enough for sidecar work. The chief features are the neat scissors type of exhaust lifter, and the excellently designed overhead inlet valves, the rockers of which work in a dustproof case, which may be filled with oil. The accompanying sketches clearly show the admirable way in which this piece of design has been carried out, and the close fitting slides which exclude the dust. The chamber in which the spring works has a large "window" cut in it, and sufficient air is admitted to ensure the adequate cooling of the spring. Well-designed adjustable tappets are fitted. The illustration of the timing gear shows that the magneto is driven by eccentric wheels, which have the effect of causing a very sudden break immediately after the maximum position has been obtained, thus causing a powerful and brilliant spark.



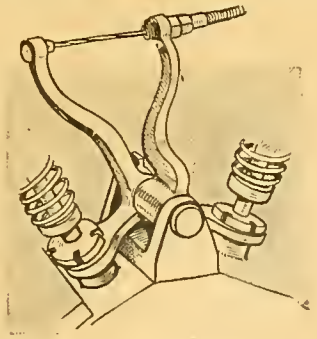
Enclosed inlet valve on the Brown. The screw shown is for securing the dust-tight cover.



The engine of the new 3½-4 h.p. Brown.

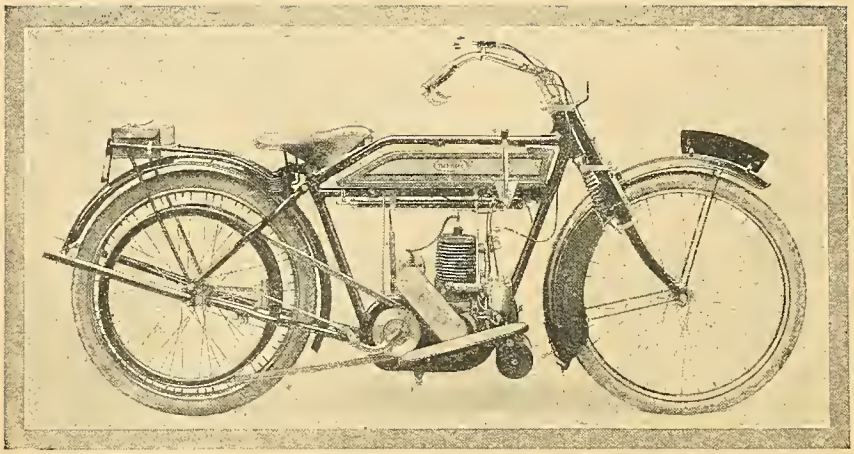
An Entirely New Model.

Quite an innovation for Messrs. Brown Bros. is the introduction of a 2¼ h.p. two-stroke motor cycle, which is to be known in future as the Vindec, and is, of course,



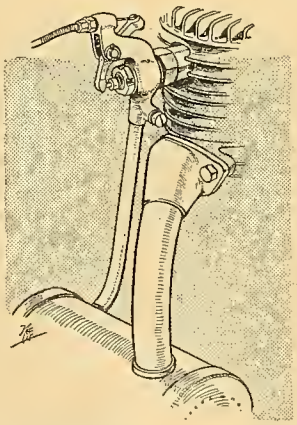
Scissors type exhaust lifter on the 3½-4 h.p. twin Brown.

Latest Designs.—



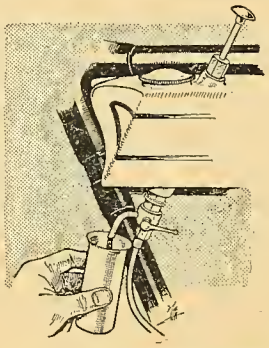
Belt side of the new Vindec two-stroke.

very different from the Vindec Special, which older readers of *The Motor Cycle* will remember. Its motive power is a two-stroke engine 64 × 70 mm. of 226 c.c., the transfer port of which is cast integrally with the cylinder. A large outside steel flywheel is fitted. The release valve exhausts directly into the silencer, a point which is most essential, as these valves are often objectionably noisy; not only so, but oil is sprayed out and gives the machine an untidy appearance. The lubrication is carried out in an interesting manner. The general lubrication of the engine is effected by means of the ordinary mixed or "petroil" system, the measure for the oil being carried inside the filler cap of the petrol tank. Close to the two-way tap of the hand pump is a spout which, when the tap is placed in the correct direction, allows the oil to fill the measure. The tap, when placed in the other direction, injects oil directly from the oil tank to a



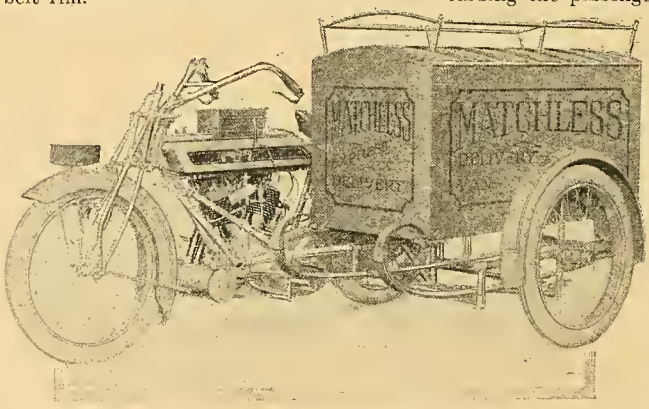
Hand control for compression release, which exhausts into the silencer.

ring running round the top of the crank case, which is in direct communication with the main bearings of the engine. A type of two-speed gear which has long been proved to be effective is fitted. It is of the dog clutch pattern, and the transmission is by chains in oil-tight cases on each side of the crank case, one for the high and the other for the low gear. From counter-shaft to rear wheel the transmission is by a ¾in. rubber belt. It is interesting to note that spring footboards are fitted. The specification in-



How the oil measure is filled.

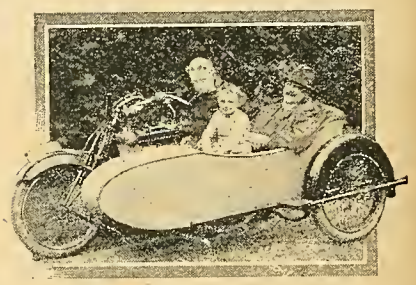
cludes 26in. × 2in. Dunlop tyres, Senspray carburetter, C.A.V. magneto, Druid forks, and Lycett saddle. The mudguarding of the front wheel is well carried out, the guard being provided with valances, while the rear guard is of wide section with an extension over the belt rim.



The Matchless sidecarrier which is propelled by a twin-cylinder engine. This sidecarrier is the latest addition to the list introduced for tradesmen's use.

THE HAMMOCK SIDECAR.

The latest Williamson sidecar is called the Hammock. It is primarily intended for one occupant, but can easily be

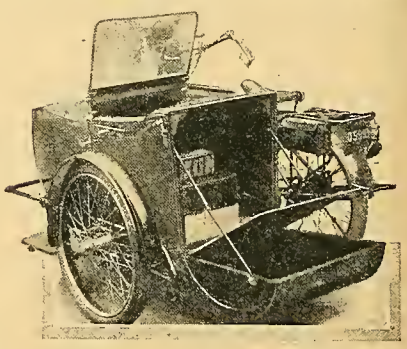


The Williamson hammock sidecar

arranged to accommodate a couple of children in addition. The child's seat is so arranged that it does not interfere with the leg room of the adult passenger, and so as to be easily removable. This sidecar is only 5 lb. heavier than the Williamson speed model, and it can be fitted to any make of machine.

A WATSONIAN SIDECAR FOR 1915.

We have often referred to the desirability of being able to get the luggage



The large boot at the rear of the latest Watsonian sidecar.

or tools stored in a sidecar without disturbing the passenger. This idea is well carried out in the Watsonian sidecar, which we illustrate herewith. The back of the car forms a boot which will hold quite a considerable quantity of luggage, or, if more room still is required, it can be let down and used as a luggage grid; it also contains compartments for small articles and places for petrol and oil tins. The chassis of this sidecar was shown in our issue for the 1st inst., and the whole should be most serviceable.

SIDECARRING FOR LADIES.

TESTS OF DIFFERENT SIDECAR OUTFITS. By May Walker.

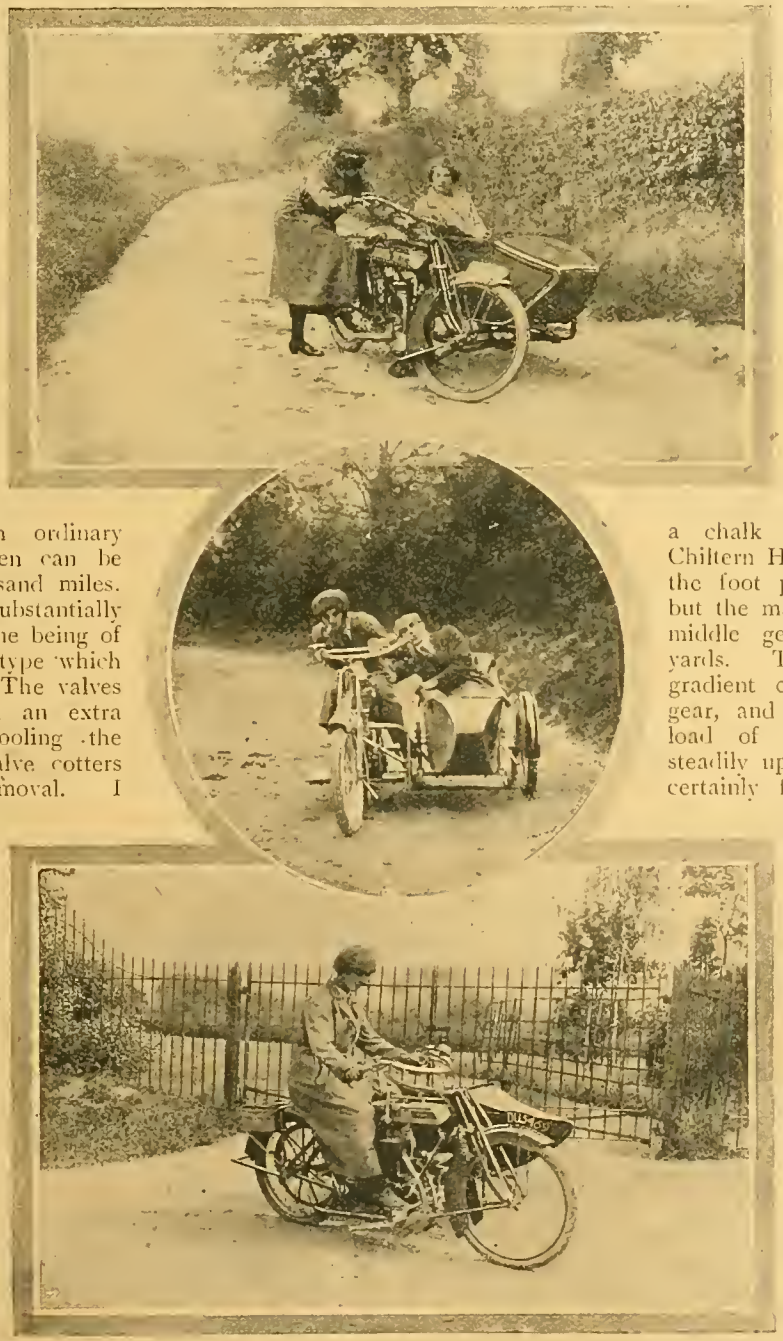
The 3½ h.p. Ariel.

IT was a brand new Ariel motor cycle and grey coachbuilt sidecar that the makers lent me for a week's trial to see what a good 1914 combination is capable of in the hands of a feminine driver. The outfit taken from its wrappings was a pleasure to the eye, the enamel and plating, together with the grey finish and upholstering of the passenger's seat, giving the impression that no trouble had been spared to create a good effect.

It was fitted with a counter-shaft three-speed gear with a big easily operated gear lever and quadrant on the side of the tank. The gear box only requires filling with ordinary gear grease and then can be forgotten for a thousand miles. The whole outfit is substantially constructed, the engine being of the low-compression type which will pull for ever. The valves are very large, and an extra flange assists in cooling the exhaust. Patent valve cotters also ensure easy removal. I filled its tank, which held eleven pints of petrol and three of oil, then, putting the gear lever in the neutral notch and opening the throttle, I started the engine with ease with the kick-starter aided by the half-compression cam.

Seating myself in the Brooks pan saddle, which was mounted on a little spring frame of its own, I brought the low gear into action, and gradually engaged the clutch, the machine with its load then moved away easily, the cork inserts of the clutch causing it to take up the drive very sweetly. The bottom gear has a ratio of 16 to 1. This makes any gradient climbable on which the wheels grip; after all, hill-climbing is only a matter of gearing if the engine does not overheat, and I found the Ariel satisfactory in this respect.

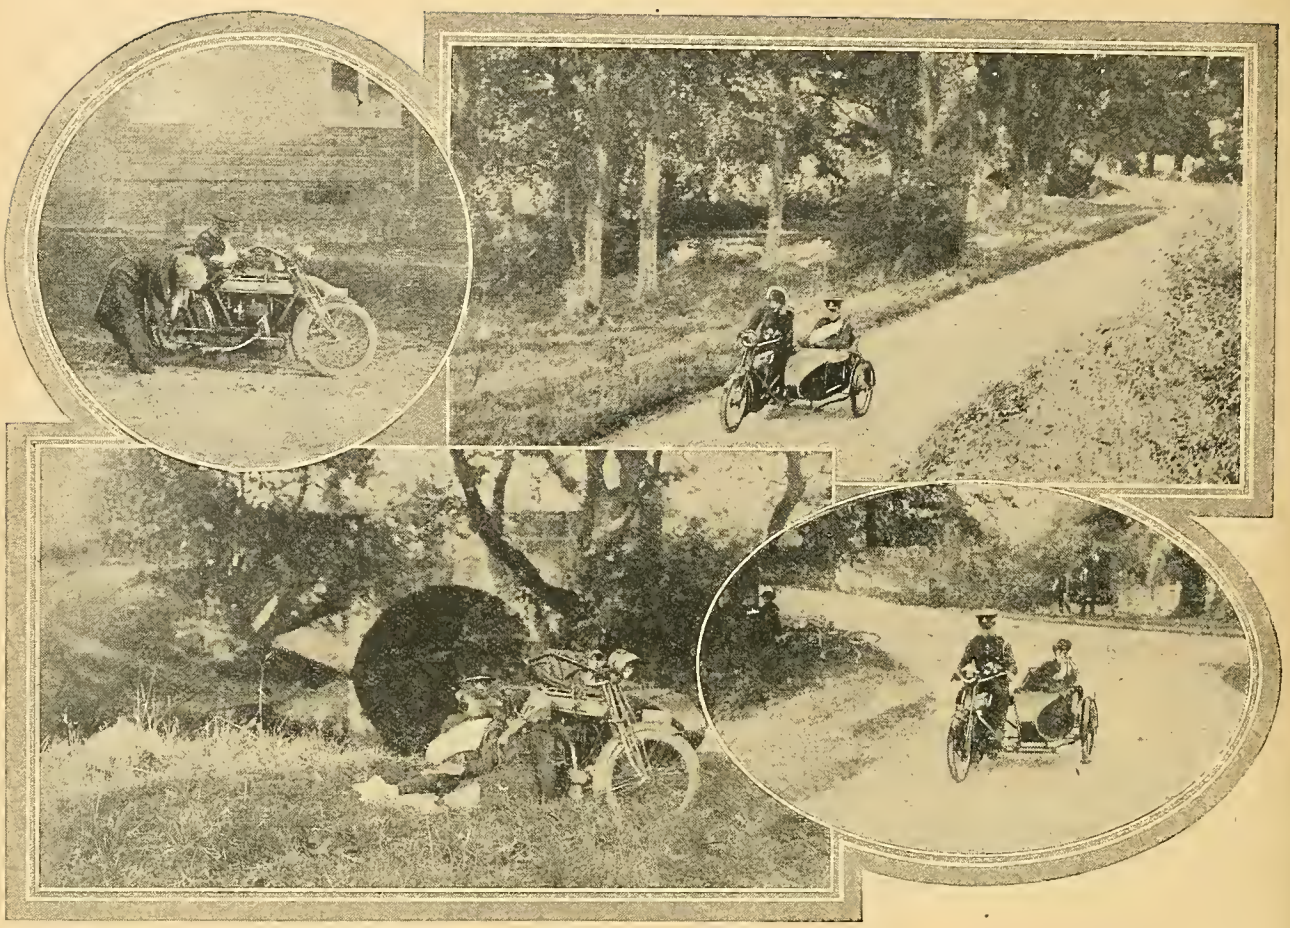
I took the combination with two passengers over many miles of Hertfordshire and the surrounding counties and through country lanes with rough and chalky surfaces and over long stretches of smooth Tarmac roads. With a hot engine I approached Whipsnade Hill, well known to all local motor cyclists; this really comprises a chalk cutting through the Chiltern Hills. A sharp turn at the foot prevents any rushing, but the machine pulled away in middle gear for a good 500 yards. Then the increasing gradient called for the lowest gear, and the machine and its load of three people soared steadily up—a most useful gear certainly for traffic and freak hills. I liked the 3½ h.p. Ariel sidecar outfit very much, it was always ready to go anywhere, do anything, and do it well.



(1) Starting the Ariel by the kick starter.
(2) At the bend on Chaul End. The machine is a 6 h.p. Hobart.
(3) The 3½ h.p. Premier and sidecar.

The 3½ h.p. Premier.

Another 3½ h.p. sidecar machine which I have had the pleasure to drive a good many miles during the last few weeks is the well-known Premier. This very machine had just returned from a trial in Holland, and, consequently, was not in the pink of condition. I made



THE SIDECAR SAMARITAN.

A pretty story told in pictures, which might appeal to the novelist or the producer of cinema simplets, showing how a lady sidecarist, adopting the suggestion of *The Motor Cycle*, takes a wounded soldier for a run in the country. Their company proves mutually agreeable, till at last the positions are reversed, and in the last picture Tommy Atkins, well again, takes Mrs. Tommy Atkins on the honeymoon.

several adjustments and then took it out on the high road to test its powers. It was capable of a good speed, but the coachbuilt sidecar seemed to be too heavily built, making rather a severe load when carrying an adult passenger, but this, I was informed, had originally been drawn by an 8 h.p. The auxiliary exhaust valve is characteristic of the Premier, helping greatly to cool the engine, allowing a long gradient to be climbed without undue heating. The counter-shaft three-speed gear was so solidly designed that it was not necessary either to declutch or lift the exhaust lever when changing gear. The large pulley, too, is "kind" to belt wear. The sidecar couplings, while strong and secure, are easily detachable, and the engine developed extraordinary power for one of 500 c.c. capacity.

The 6 h.p. Hobart.

I have also lately sampled a 6 h.p. Hobart sidecar with a J.A.P. engine. It was in design similar to several other 6 h.p. combinations on the market. The standard black and gold finish is very workmanlike, and the details are well carried out, the long and adjustable footboards giving a welcome change of position. The machine is chain-driven and is fitted with a two-speed gear having direct drive on both gears controlled by a lever on the tank. The two-speed gear is of the expanding clutch type. The harshness associated with some chain-driven machines is eliminated, as a cush drive hub is fitted and a patent slipping clutch on the engine-shaft. It is, in fact, the well-known Enfield transmission. I took it up several severe hills. In the low gear it climbed well, the engine being silent and efficient. On level roads, I found the machine would run regularly and well from six to forty-five miles an hour on top gear. It was easy to handle, and any rider who is accustomed to only a featherweight would feel no nervousness at the helm of this flexible and capable sidecar outfit.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost" and "Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and all that are notified to us are inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.

The BEST Oil for Winter use.

Motor cyclists will be unable this year to call at Olympia, and they should write for H.L. Literature, which fully describes many interesting preparations.

PRICES' COMPANY LIMITED,
BATTERSEA, LONDON, S.W

South Birmingham M.C.C.

The fourth annual captain's run, on the 3rd inst., took the form of a paperchase over a course of about twenty-five miles. A good trail was laid by the captain, J. J. Woodgate, on his 10 h.p. Singer light car, which included several watersplashes and bits of "Colonial" road. The results were as follow: 1, E. L. Edkins (6 Ivy-Jap), 3.6; 2, S. H. Fletcher (3½ Premier), 2.1; 3, W. Mansell (4 Norton sc.), 1.8. E. G. Bastock (6 Enfield sc.) and A. H. Johnston (2½ Alldays two-stroke) also made non-stop runs.

Southampton and District M.C.C.

The annual competition for the Oakley challenge shield took place early last week in the New Forest. The competition is usually very keen, and this year resulted in a dead heat between three members, one of whom was a lady. The final test took the form of a fifty-three mile non-stop trial, run at the legal limit, watches and speedometers being barred, in which all the competitors came through without a stop, the winner being E. C. Prince (3 h.p. Enfield), who completed the course within 6m. 16s. of correct time. J. Tuffin (3½ h.p. New Hudson) ran a very close second, being within 44s. of the winner. Third place fell to Miss B. Sims (6 h.p. New Hudson and sidecar).

Southern Counties Cycling Union.

The entire proceeds of the annual Bohemian concert, to be held at the Horns Assembly Rooms, Kennington, S.E., on November 18th, will be handed over to the British Red Cross Society. Hon secretary, Mr. G. A. Newton, 126, Merton Road, Wandsworth, S.W.

Coventry and Warwickshire M.C.

The closing run is to be held next Saturday to Stratford-on-Avon, meeting at the Grammar School on Warwick Road at 1.45 p.m. In connection with the run a rifle shooting competition will be held at the Shottery Range, commencing at 3 p.m. An entrance fee of 2s. will be charged, the proceeds to be devoted to the Prince of Wales's Relief Fund.

Acton and District M.C. and L.C.C.

The opening run was held on the 3rd inst., and was well attended. Dr. A. M. Low, the president (A.C. light car), led the way by a circuitous route to the Hut at Wisley, where tea was served, after which the short run home to headquarters was uneventful. A hill-climb, with separate classes for private owners, will take place shortly. The honorary secretary is Mr. E. B. Hunt, 47, Woodfield Crescent, Ealing.

Members of the Acton and District M.C.C. assembled for a run to the Hut at Wisley.

Imports and Exports of Motor Cycles.

THE import and export figures for September are more than usually interesting, for September is the first month to be affected from first to last by the war. The trade in motor cycles and parts thereof does not show anything like the decrease that might have been expected, and, in fact, they compare very favourably with other manufactured goods. The imports are naturally affected to a large extent by the fact that some foreign countries are not in a position to despatch machines. We quote from the Board of Trade returns:

Exports.

FOR THE MONTH ENDED SEPTEMBER 30TH.

1912.	1913.	1914.
£76,398	£78,504	£63,875

FOR THE NINE MONTHS ENDED SEPTEMBER 30TH.

1912.	1913.	1914.
£477,740	£729,928	£915,062

Imports.

FOR THE MONTH ENDED SEPTEMBER 30TH.

1912.	1913.	1914.
£16,539	£13,737	£6,278

FOR THE NINE MONTHS ENDED SEPTEMBER 30TH.

1912.	1913.	1914.
£131,528	£198,667	£168,009

In August last the value of imported motor cycles, together with parts, was £9,577 against £19,284 of August, 1913, and the value of the British exports £77,121 against £67,714 of the previous year.

Comparing the decrease for the month with that of motor cars, we find that exports of motor cars decreased in value £55,382 (22%), whereas the decrease in value of motor cycles was £14,629 (18½%).

The decrease in the value of motor cars imported was £425,814 (76%), compared with the decrease in the value of motor cycles imported £7,459 (55%).

In spite of the war, which has now lasted over two complete months, the total export value of motor cycles exceeds last year's by nearly £200,000 for the nine months.

TIMES TO LIGHT LAMPS

Artillery Wheels on Sidecars.

We hear of a new design sidecar outfit, which will most probably have artillery wheels as standard.

Petrol Imports Last Month.

During September 9,378,348 gallons of motor spirit were imported into this country (value £365,353, or about 9¼d. per gallon). In September, 1913, the quantity was 12,712,120 gallons and value £532,166.

More Douglases for the W.D.

It is interesting to have to record that Messrs. Douglas Brothers have received an order for a further hundred Douglas motor bicycles for the War Office. The extreme handiness and efficiency of these little machines are evidently greatly appreciated by the British military authorities.

Standardisation of Controls.

A distinct step toward standardisation of controls has been made by the formation of the Engineering Standardisation Committee, mentioned in our "Letters" columns this week. The A.C.U. and the Motor Cycle Manufacturers' Union have already considered the matter without result. Perhaps the efforts of the new committee may meet with better success; at any rate, we hope so

Well-known Rider for the Front.

J. Chater-Lea, Junior, who has been well to the front in road and track competitions during the past few seasons, has volunteered for active service, and has been attached to the Royal Engineers as Sergeant in Charge of the Motor Cycle Section. He is riding his Chater-Lea 2½ h.p. two-stroke motor cycle, and is at present stationed at Newhaven.

Cheaper Petrol.

Last week *The Autocar* gave it as its opinion that a decrease of a penny a gallon upon both light and heavy grade motor spirit is a possibility of the near future. Though a penny reduction will "not set the Thames on fire," motor cyclists will be thankful for small mercies.

The price of petrol is now being discussed in many quarters, since the recommendation of *The Motor Cycle* to reduce the price to a shilling a gallon, and thus bring about more extensive motoring.

BS

Motor Cycle Fire Brigade.

In response to a call last week the fire brigade at Green Street Green turned out on their Royal Enfield outfit to a fire in farm premises at Downe. The four miles up hill was covered in less than eight minutes, and the brigade arrived in time to avert any damage of an extensive character.

More Despatch Riders Wanted.

The Auto Cycle Union has been approached by the First London Machine Gun Battery for assistance in the enlistment of fifty motor cyclists. The battery is a privately raised force which will be attached to a battalion, which is probably leaving for the Front within a month, and is at present in camp at Wembley Hill. About twenty-five men are required as motor cyclist despatch riders, and the remainder will be required to be equipped with sidecar machines, which may also be needed to pull machine gun trailers. The men will be required to enlist for three years or duration of war, and must provide their own kit, which will cost in each case about £5. The machine will be taken over on the ordinary War Office terms. Motor cyclists desirous of joining should apply for further particulars to the Recruiting Office, 104, Victoria Street, London, S.W.

SPECIAL FEATURES.

LARGE EXPORTS OF MOTOR CYCLES.
DESPATCH RIDERS' EXPERIENCES.
IN THE PEAK DISTRICT WITH A SIDECAR.

Head Lamps Barred.

By a new regulation the use of head lamps on cars is barred in and around Margate. At night cars are using paraffin side lamps, and even the trams have only a few interior lights. Great care is necessary on the narrow twisty roads. Apparently standard motor cycle lamps are permitted, the regulation only applying to cars.

A Liverpool Roll of Honour.

A list of Liverpool motor cyclists who have been called up for military service is being compiled by Mr. S. W. Phillpott, North-Western Centre Secretary of the A.C.U., who asks the relatives and friends of all such to be good enough to furnish him with the following details:

Name and home address of the motor cyclist.

Regiment or Service joined.

Whether as motor cyclist or otherwise.

Froghole Cottage, Newington, which is believed to be the oldest house in the county of Kent, having been built in 1501.

M.C.C. Roll of Honour.

The committee of the Motor Cycling Club is compiling a list of members who are serving in any of His Majesty's forces.

An Equipment Number.

In addition to the annual Buyers' Guide on November 19th, a special issue of *The Motor Cycle* will be published on Thursday, December 10th, dealing with accessories, tyres, clothing, and equipment generally.

Splendid Response of Motor Cyclists.

After our letter pages had gone to press we received the following letter from the Rev. F. W. Hassard Short: "Sir,—It may interest you to know that I have received in the last few days applications from over 200 motor cyclists anxious to enlist for service with the R.E. Signal Companies. Amongst these are many well-known riders. So far I have only been able to offer places to nine of them, but hope to find places for more in course of time.—F. W. Hassard Short, Secretary, Motor Cyclist Reserve Committee, Home Counties Division."

Pro Patria.

Another instance of the willingness of motor cyclists to help their country was the number of replies received to the Scott Company's appeal for motor cyclists for enlistment. On Monday as many applications as could be dealt with had been received by the Scott Company.

What New Zealand Clubs are Doing.

Immediately on receipt of news that war had been declared between England and Germany the respective secretaries of the Pioneer Athletic and Bicycle Club (Motor Section) and the North Canterbury Motor Cyclists' Club wired the Prime Minister of Dominion (Right Hon. W. F. Massey), offering the services of the clubs to the Defence Authorities. These offers have been accepted, and members of the clubs appointed as despatch riders. The Pioneer Club also decided to hold a rally to collect money, etc., by motor cycle and sidecar rides in aid of the Patriotic War Fund. The fund is mainly to help to provide equipment for members of the Expeditionary Force, and to maintain those dependent on the volunteers for the force.

A Large Order for Coventry.

Coventry firms have reason to congratulate themselves upon the order for motor cycles received from the Russian Government, which is as follows:

Rudge, 3½ h.p.	400
Rover, 3½ h.p.	350
Humber, 3½ h.p.	300
Triumph, 4 h.p.	300
Premier, 3½ h.p.	300
Premier, 7-9 h.p.	12

It will be noticed that the great majority of these are single-cylinder belt-driven machines of a capacity in the neighbourhood of 500 c.c. Naturally, the aforementioned firms are very busy at present, and some are working over the week-end, for it is necessary to get the machines sent off very soon. Taking the average price to be only £50, the gross value of these machines amounts to £83,100.

The New Hudson Co., of Birmingham, and the Clyno Co., of Wolverhampton, were also favoured with large orders.

More Motor Cyclists Wanted for the Army.

Mr. J. W. Stocks, the well-known motorist, who first became acquainted with the internal combustion engine on a De Dion motor tricycle, from which he developed into a racing expert, has received a commission in the Royal Naval Volunteer Reserve in connection with the armoured motor car scheme of this body. He has been authorised to look out for a number of *experienced* motor cyclists who possess a thorough knowledge of French, who will be required for active service as despatch riders. Further particulars can be obtained on application to Mr. J. W. Stocks, 10, Great Marlborough Street, London, W.

Dangerous Dogs.

A correspondent, who has been frequently attacked by a dog, has sent the following letter to the owner by registered post: "Sir,—On several occasions recently a brown Irish terrier has rushed out from your grounds attacking me whilst riding my motor bicycle, very narrowly causing a serious accident.

"I understand the dog belongs to you, and this letter is to call your attention to the fact, so that should any accident occur through this habit of the dog you may be liable for damages.

"I am sending copies of this letter to the Automobile Association and *The Motor Cycle*."

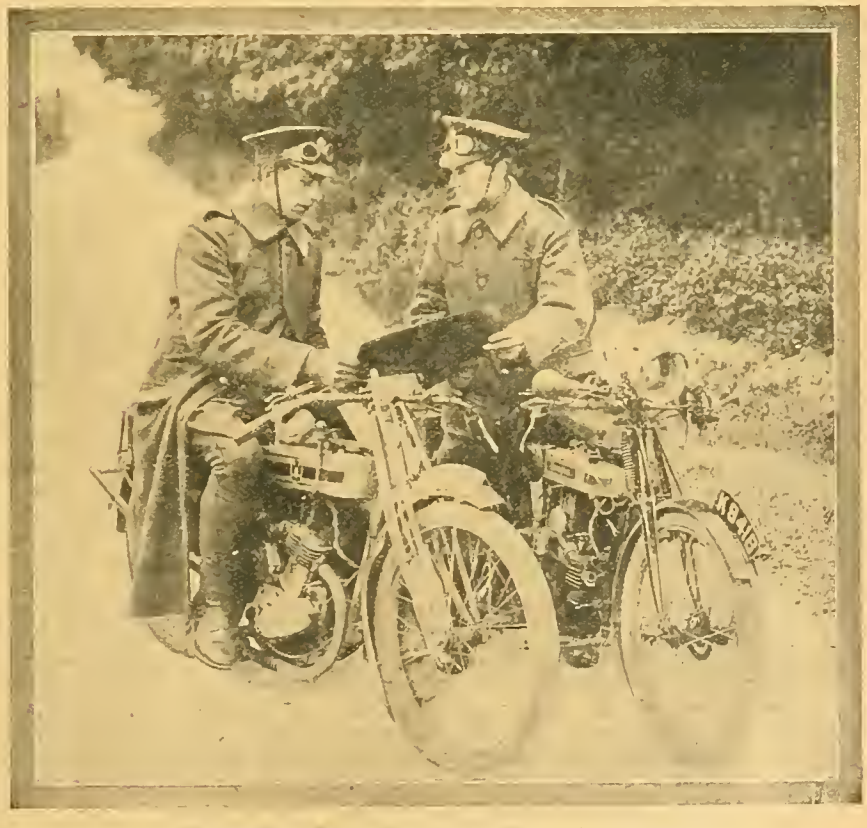
Other readers, who have been similarly annoyed, are advised to follow the same procedure.

The Multiplication of Gears.

In connection with our leader of last week dwelling upon the multiplication of gears in connection with 1915 models, it would appear that the movement has spread to America, but whereas in the States two-speed gears are giving place to three-speeds, British makers are a stage further advanced, most having three gears and moving up to four. Manufacturers in the States have hitherto shown themselves entirely satisfied with a two-speed gear, but for 1915 the Harley-Davidson have adopted a three-speed gear of the sliding type fitted in the counter-shaft, a "step" starter being incorporated in the design. By the way, the new Harley-Davidson twin-cylinder bicycle is rated at 11 h.p.—it was 8 h.p. originally, its capacity being 60.34 cubic inches (989 c.c.). An additional model for 1915 has a 6 h.p. single-cylinder engine.

In Aid of the Relief Fund.

Quite a novel idea has been hit upon by a sidecarist in connection with the Stratford-on-Avon annual "Mop Fair" this week. The sidecarist in question has an up-to-date 6 h.p. Enfield sidecar outfit, and he is giving sixpenny rides to all and sundry, the proceeds going to the Prince of Wales's Relief Fund. We believe the idea is being extended by local motor cyclists in consequence of the "trade" being done. No doubt this useful scheme will pay, for one hears dozens of people remark, "I would like to try one of those sidecars, they look so comfortable."



LANCASHIRE MOTOR CYCLE DESPATCH RIDERS.

E. F. Baxter (twin Rex) and L. Mogridge (Douglas), who were among the first to volunteer for active service, and are attached to the Royal Engineers

THE COLOSSAL COLONIAL TEST.

By H. MORTIMER BATTEN.

WHEN early in the summer this journal suggested that a Colonial trial be held this autumn for the benefit of Overseas riders, and for the purpose of giving manufacturers who consider their machines capable of hard usage an opportunity of proving their capabilities, the suggestion was enthusiastically supported not only by Colonials but by all readers who realised the fact that a machine that would stand Colonial use would stand British use with a few yards to spare. The cry was not for a heavy and cumbersome mount made solely for the Colonies, for there was proof enough that a properly designed touring machine was quite adequate for foreign demands, but an attempt to induce manufacturers to redesign certain fittings which, though all right for our broad highways, are apt to give way when submitted to the severe strain of Colonial roads.

The trial has, of course, fallen through, but in its place we have a Colonial test under way of far vaster proportions than anyone could have planned, a test which stuns the imagination by its magnitude, and which will leave an indelible stamp upon the motor cycle industry of the future.

Little did one then think that the motor cycles of Great Britain would be shipped across the Channel by the thousand to take part in a contest of such significance, a test of such severity.

One cannot help looking back upon the events of our routine calendar—the Six Day, the Scottish Reliability, even the T.T.—as mere games in comparison with the great event of to-day, and yet in their turn they were all-important, for they were the foundations in the building of a machine which is playing an important part in the life or death struggle of nations. Were it not for these trials the motor cycles of Britain would not have attained that standard of perfection that has placed them first on the list as instruments of war.

Those who have played a part during recent years in the perfecting of the motor cycle cannot help feeling a thrill of pride when they contemplate the important part that these machines are playing in the crisis, and one waits with interest for the results that the war will doubtless produce upon the motor cycle industry and upon the design and construction of machines. So long as the war lasts the leading manufacturers will consider the demands of the War Office, and the effect will reach further than any trial that could possibly have been organised, because it will produce a type of machine eminently suited for the demands of warfare. This, I cannot doubt, will be a machine of Overseas type—or, at any rate, one that is well suited to the demands of the Colonial rider—while it will fulfil the demands of the British tourist.

When the British manufacturer has been brought to realise a flaw in his productions he is usually not long in stopping it up, but in the past there has been nothing to bring the flaws of motor cycle construction before the general eye of the public but the recognised reliability tests. The Overseas motor cyclist has cried aloud, but he has been too far away for his cries to be heard. Had not something momentous happened, one can foresee that motor cycle design would have followed quite a different trend.

The Influence of War.

There is no question that the war will be influential for good so far as motor cyclists and the industry are concerned. The present demands of the War Office are great and will continue to be great so long as the war lasts, for a considerable wastage of machines is bound to take place. When the war is over, and the young manhood of the country returns, the demand for touring mounts will return also, while motor cyclists who have been out on active service will have formed a fair idea as to the most desirable type of mount for real hard usage. It is in this manner that the war will leave its stamp upon the motor cycling industry; it may be regarded in much the same light as a gigantic competition, and the surviving competitors will clamour for machines of the type that have proved their worth, while non-competitors who have been compelled to remain at home will follow their example.

Some idea as to the wastage that takes place at the front can be gathered from the fact that many of the despatch riders are already using their third and fourth machines, while out of the ten machines attached to a certain battalion only two survived the fighting at Mons. The others were put out of action, mainly by shrapnel fire, and were left on the field of battle amidst other wreckage. A breakdown of any sort may mean that the despatch rider is compelled to leave his mount, and any alteration in the formation of the fighting columns may lead to its total loss.

It is well to be optimistic where we can, and there is no reason to deplore the fact that all trials are suspended for the time being. A test of greater importance than any we have known is under way, and from amidst the oppressions of war we can afford to look forward with happy anticipation for the results this test will produce.

1915 MODELS AND "THE MOTOR CYCLE."

ANNUAL BUYERS' GUIDE ON NOV. 19th. EQUIPMENT NUMBER ON DEC. 10th.

New models are now occupying the attention of manufacturers, and the pages of "The Motor Cycle" during the next month or two will be particularly interesting to motor cyclists and prospective riders. The earliest descriptions of new model motor cycles regularly appear in these columns; the accounts are penned by technical writers in interesting yet non-technical language, whilst sketches of mechanical details and photographs are a feature.

On November 19th a special Buyers' Guide issue of "The Motor Cycle" will be published, giving the specifications of all the leading 1915 models. This annual feature will prove more valuable this year than ever before in view of the manufacturers' decision not to hold a Show.

Accessories, Tyres, Clothing and Equipment Generally will be dealt with in a special issue on December 10th.

TALES FROM THE FRONT.

WE recently had an interesting conversation with Corporal F. A. Enders, R.E., who is home on convalescent furlough. He was attached to a cavalry division, and left England with several other motor cyclist despatch riders, among whom may be mentioned Howard Newman and Lovegrove, Ivy and Scott riders respectively, both of whom were mounted on B.S.A.'s. The party was split up at headquarters, Newman, who is doing well, going to the First Army Corps. Other well-known riders he encountered were Featherstonhaugh, and Roberts, one of the Humber mechanics. Enders was mounted on a 3½ h.p. P. and M., a machine which he considered to be eminently suitable for

Corporal F. A. Enders, R.E.

the work on account of its extreme reliability and capability for standing the terrible racket it had to undergo. The distances covered by despatch riders are not excessive, and usually amount to twenty or thirty miles at a stretch, but the work is continuous, and often Enders was on duty for twenty-four hours at a time, and he said that there were three things the motor cyclist had to make a point of getting—petrol, food, and oil. As his work was with the cavalry, he was right up in the firing line, and in the pursuit, after the battle of the Marne, they were always more or less under fire from the German rear guard artillery. Enders told us it was great sport rounding up the Germans after the battle, and he was enjoying life pretty well when he was struck by a glancing shot on the foot, but what really put him out of action was being kicked by an unpatriotic artillery horse on the ankle and in the stomach, which caused severe internal injury. He had to travel three days lying on straw in a cattle truck, and then came a gloriously comfortable voyage on a hospital ship to the English coast, followed by a spell in a hospital in Glasgow, miles away from his people, who live in London. Talking of his work, he said that by far the worst experiences he had to undergo were at night, when he was forced to ride without a lamp. The noise of the engine makes it impossible to hear a challenge of a sentry, and several times he was shot at. One of our men, he assured us, was shot clean through the head by a French sentry, to whom, in the dark, the British and German uniforms look very much alike. Once he saw the sentry just in time, and bringing his machine to a standstill found a long French bayonet three inches off his chest.

Steady Driving Necessary.

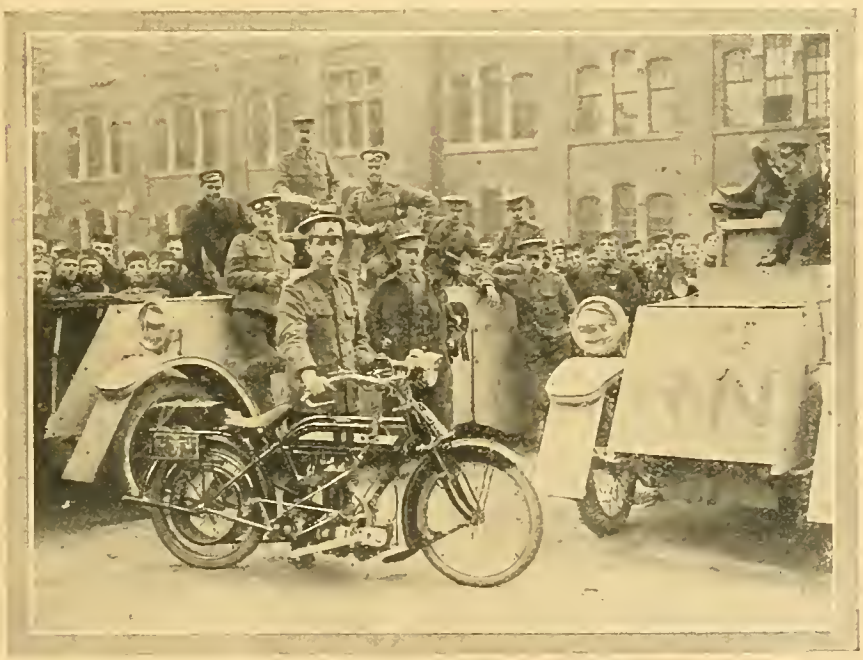
Enders laid special stress upon the importance of driving steadily, so as to get there and save the machine as much as possible, and only of sprinting when real necessity for such an action occurred. Fortunately for him, he speaks good French, and was in consequence able to get on much better than most of our other despatch riders. He is looking forward to the time when he will have to report himself at Chatham, and be off to the Front again.

PENALTY FOR BEING LOYAL.

M. Galopin, one of the leading lights of the technical department of the Fabrice Nationale, has, it is rumoured, been sent to Germany as a prisoner of war for refusing to manufacture arms for the enemy. M. Galopin has often come over to England in connection with the Motor Car and Motor Cycle Shows.

DESPATCH RIDER'S GOOD WORK.

Cyril Mocatta, who was one of the last Englishmen to leave Maubeuge, was heartily cheered by the French soldiers in the trenches as he rode by on his motor cycle. He was recently commended by General Bulfin on the smart way in which he had got his despatches through.



RETIREMENT OF BRAVE ANTWERP DEFENDERS THROUGH BELGIUM.

A motor cyclist scout attached to the Royal Naval Brigade, who has done good service between Antwerp and Ghent, photographed at ———. Observe the armoured cars.

This photograph has been passed by the Censor, who will not allow the name of the place to be mentioned.

Terrible Experience of Motor Cyclists.

How two British Despatch Riders were Captured and Attempted to Escape.

SERGT.-MAJOR MACKAY, of the Army Motor Transport (Army Service Corps), tells a most dramatic story in the *Daily Mail* of the 13th inst. of the manner in which he and the Hon. Geoffrey Pearson (son of Lord Cowdray) were captured by the Germans when acting as motor cyclists with the motor transport.

They were riding fast along a straight road, with open country on either side, when they suddenly met with a perfect hailstorm of bullets, but dashed through into safety. However, a little further on they rode into a group of German cavalry about fifty—who took them prisoners, and, when they found that they were English, treated them with the utmost brutality, spitting at them, knocking them about, and prodding them with bayonets. The Germans then made Mackay and Pearson mount their machines and accompany them, but the motor cyclists, having no intention of allowing their machines to fall into the hands of the enemy, turned off the oil, with the result that the engines presently seized and became immovable. The Germans were very suspicious, and asked the riders why, being motor cyclists, they could not repair the machines, but they declared that the machines were worn out with hard wear and could not be repaired. So they were left by the roadside.

British Treatment.

"The Germans," to use Sergt.-Maj. Mackay's own words, "treated us shamefully. They gave us nothing to eat and taunted and jeered at us at every opportunity. That night we spent in the open, lying on the roadside between two men. We had no overcoats and it was most bitterly cold. I think I have never been so cold in my life as I was that night.

. . . . .

"The Germans took us on with them in their advance against the French. Outside Meaux, near a village called Varredes, they made us go into the trenches with them. We had a terrible experience there. We were thrust in the line with the rest under a terrific fire from the French guns and infantry. The French shrapnel was awful. The Germans fell like flies, and their bodies began to pile up in the trenches.

"I had a good opportunity of seeing the German soldier under fire, and I must say he is plucky enough. . . . The officers simply drive their men on, laying about them on all sides with the flat of their swords."

A Dash for Liberty.

By this time the motor cyclists had had enough of the Germans and their continual abuse and decided to make a dash for liberty. They managed to crawl out of the trenches and into some long grass without being noticed, but when about 200 or 300 yards away the Germans caught sight of the runaways and immediately opened fire on them.

"By instinct," says Mackay, "I flung myself flat on my face and noticed that Geoffrey did the same. Seeing that we did not move, the Germans took no further notice of us, and I lay there for three hours without moving. Then, by very cautious reconnoitring, I ascertained that the trenches were empty and the Germans had gone. I turned to Geoffrey, who had lain immobile from the moment that we dropped. What I had feared at seeing him lie so still was true. He was dead, shot through the back of the head."

Mackay then took refuge in a loft, where he spent two days without food, four Germans meanwhile occupying the room below him. How he eventually escaped we will let him tell in his own words.

Back to the British.

"When the Germans left the house I came out, got into a house next door, and found a set of peasant clothes which I donned. Then, in order to complete my make up, I got a calf from the village, and, leading it, passed unrecognised right through the German lines into the French. None of the Germans took the faintest notice of me. I have got that peasant suit still, and mean to keep it as a souvenir of my experience.

"I fell in with the French in a wood. I saw cavalry, and thinking they were German hid, but presently discovered they were French. At first the French took me for a spy, but one of their officers, who spoke English well, soon recognised me and passed me through to the British. A week later I returned to Varredes and found the body of poor Geoffrey Pearson lying where I left it. I buried him there with the assistance of some peasants and planted a cross with the name and date on the grave, the position of which I carefully noted so that it can be easily found later on.

. . . . .

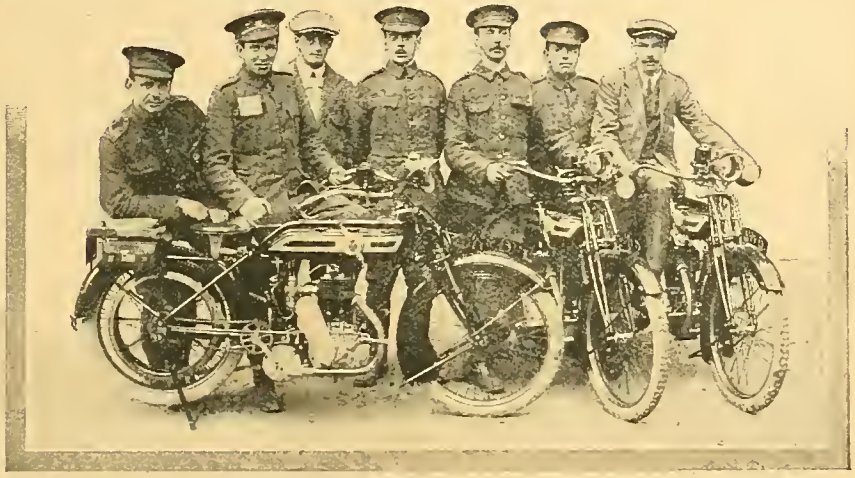
"He is the only Englishman buried in this part of the battlefield. His is a noble burying place. In every direction as far as the eye can see are the simple graves of those who fell in battle, little graves like his marked by a blood-stained *képi*, a handful of flowers or a little flag, in the case of the French, or long mounds of brown earth surmounted by a rough cross, in the case of the Germans."

SCENE NEAR THE FIGHTING LINE IN FRANCE.

British motor cycle despatch riders making a halt at Columnieux and mingling with French soldiers and officers. One of the motor cyclists (a Douglas rider) has a German eagle as a war trophy; the other, who is seen mounted on a Triumph, had a damaged finger, but pluckily continued his work.

Experiences of Other Despatch Riders.

ONE day last week we heard that Corporal I. Bethwaite, R.E., a well-known motor cyclist of Barrow-in-Furness, who has done good work in various competitions in Cumberland and the adjoining counties, was lying wounded in a hospital on the outskirts of London. We found Bethwaite pretty well, quite cheery, and full of praise for the excellent treatment he was receiving. He told us he had been in France since August 8th, when he landed with his 1913 Rover at a western port and proceeded up country to the firing line. Three other motor cyclists were with him, two on Triumphs and one on a Douglas, and when he left them both men and machines were doing good work. The officers were delighted with the motor cycle riders and never ceased to praise their pluck, usefulness, and endurance. Bethwaite's happy career temporarily ended at the battle of the Aisne. He had been given an important despatch to deliver and was travelling at a good speed along a road which was exposed to a heavy shell fire from the enemy.

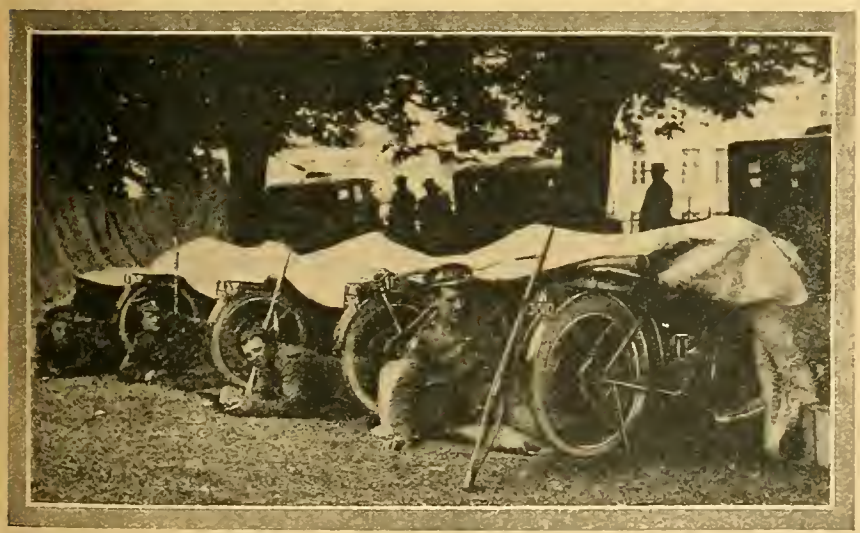


Seven motor cyclists attached to the motor cycle section of the 1st County of London Yeomanry. The machines depicted in the photograph are standard 3½ h.p. Rovers, with three-speed hub gears.

Dodging Huge Holes in the Road.

Great holes blown out by the "Black Marias" were seen at frequent intervals, and suddenly one shell landed a hundred yards or so in front of him and exploded. Two great chasms had then to be dodged, and as he was executing this manœuvre the ground gave way and he fell heavily, striking his head as he did so. He lay dazed for an hour, and then, pulling himself together, he set out to walk the rest of the way—2½ miles—and safely delivered the despatch. The officer whom he had to see was much impressed by his pluck and made him rest for an hour or two and was loth to let him go at the end of that period, but go back he would and walked to the machine, patched it up well enough to get back to headquarters, and finished his day's work. He did his best to carry on, but eventually he had to give in and go into hospital. The story which has been published of the poor motor cyclist who was shot several times when trying to mount his machine when hard pressed by Uhlans, who came up to him and before he expired turned his own petrol on him and set fire to it, Bethwaite thoroughly believes to be true. He himself had been tackled several times by these German lancers, but managed to get away from them, while he told us that the German motor cyclists were no match for our own men.

He got very wily in dodging the shells, and on one road which he had to traverse there was a hill, the crest of which was much exposed, so he used to charge an almost vertical bank, slide down the other side, and ride for a time under cover. Once a fragment of shell cut the leather off the top of his boot. He had to get food and rest as best he could, and once had to go three days without either. His Rover mount with its Kempshall tyres and Dunlop belt behaved splendidly.



BRITISH MOTOR CYCLIST DESPATCH RIDERS AT THE FRONT.

The machines are all P. and M.'s, and are covered with tarpaulin, the space between providing sleeping accommodation for the men. The picture was taken in France near the firing line.

IN SOUTH AFRICA AND FRANCE.

THE Daily Mail has published two letters from despatch riders which give an idea of the experiences which motor cyclists have to undergo in foreign countries, while the second letter is just the jolly, whole-hearted expression of the excellent spirit prevailing among the young men who gaily give their lives for their country, treat the terrible risks they run as a joke, and count them as "all in the day's work"!

In the Jungle.

From a motor cycle despatch rider in British East Africa:

"The other night, when it was just getting dark, the captain had to send someone to the next camp, and I was asked to go. It was twenty-three miles away and there is only one road or track to it running right through jungle all the way. Off I went on the most exciting ride I have ever undertaken.

"I was fully armed with a service rifle and revolver, hunting knife, water-bottle, haversack, and ammunition. All that was on my back, including a bandolier, the whole lot weighing about 50 lb. The first thing I ran into was a pack of baboons, some of them as tall as 5ft. They ran in front of my light for about a mile. The brutes would not shift; you ought to have heard them bark. I rode behind one big brute within three yards of him. I would not have got into his clutches for all the money in the world. However, they at last turned off into the bush.

"The stray game that were hanging about that road—well, it is impossible to mention. I swore I would shoot some

Experiences of Despatch Riders.—

the next morning. I saw two fine leopards. One brute did not attempt to move until I was within three yards of him. I suppose he thought it wiser to get out of the road of the bright light and the roar of the engine. He opened his mouth and snarled, then sprang to one side, and I did not half go when I had passed him in case he took it into his head to follow me.

"Everyone was up ready when I got there. They had heard me coming. I delivered my message to the captain. Then he asked me into his tent and gave me something to eat and drink. I told him about the leopards I had seen, and he was very interested and said that just before I came in two of their sentries had been driven away from their posts by lions.

"When I was lying out under my blanket that night we could hear their roaring about a quarter of a mile away, and despite the wild beasts I slept as sound as if I were in my old bed at home."

The Major's Horse.

The following is a letter from a motor cyclist despatch rider in France :

"Dear Old Horse,—Yours of the 2nd inst. to hand—and very nice too. Having nothing to do for the moment I sit down on the ruddy battlefield and reply.

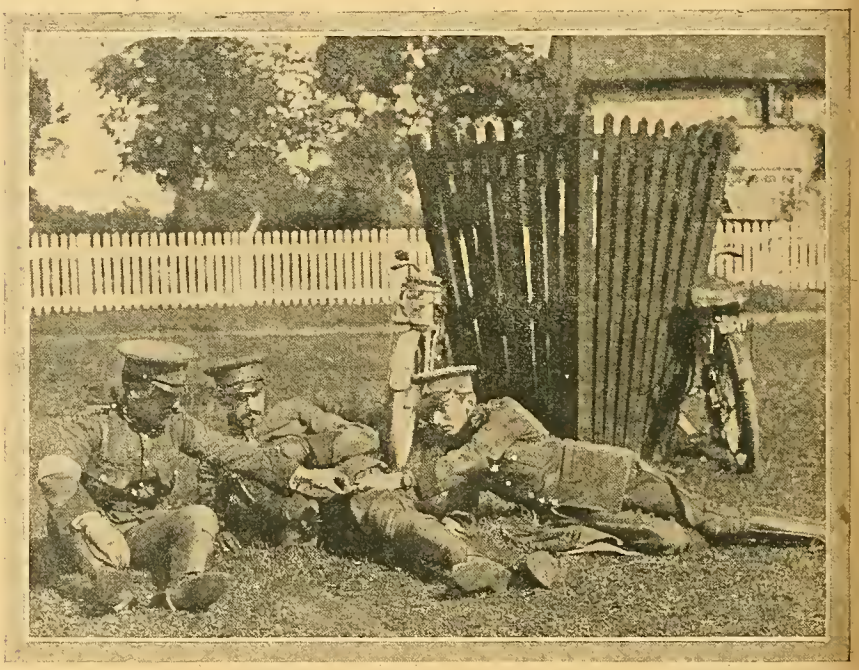
"All goes well—am now fed, washed, and slept. Have been scrapping for ten days and shell-dodging literally and truly by inches—don't care a twopenny damn for shrapnel and a fourpenny one for high explosives. This show is bound to do well; they are such a bully crowd of boys and they'll beat anything and everybody in time—much less half-hearted, half-starved Germans.

"I've had some tough times in this outfit, I can tell you. Last week was a peach, sleeping out in the rain with nothing but an overcoat. Quartered in a hay-loft now though—dry as a bone and no shells in the roof at present. Mo-biking most all night—reminds me of Lynn trips sometimes—except the absence of old beer and the shell holes one has to dodge and the fat sentries and the jolly barricades. Ran into one and smashed a new bike up one night. Life is one continual procession of new 'triumphs' nowadays. Defy you to do a bike in in a fortnight.

"Saw —— —— the other day—on a 9 h.p.—deadly dull, only hears guns fired every now and then. Curse that. Went to a major the other day. Had to shout to make him hear on account of flaming shells aforementioned. Called for his horse. 'Sorry, sir,' says the orderly. 'Just been shot, sir.' Funny that—what? Rifle fire good fun, but aforementioned shells give me cold feet.

". . . Writing this in the dark; can't write more for the moment, and will write again soon. Love to all the bhoys and good luck. We'll have a bust when this lot is over. Will drink tea without milk with you when I get back. —Your old pal, ——."

Lance-Corporal J. Conchar, R.E., on his P. & M., a machine which is doing excellent service in his work. He regards it as being pre-eminently the machine for despatch riders.



Three motor cyclists who were employed as despatch riders on the staff of the Duke of Connaught at the 1904 manœuvres.

The excellent work of the British motor cycle despatch riders has called forth the warmest praise from the allied commanders, who have been enabled through their services to maintain constant communication along the enormous front, which extends about two hundred and forty miles, from the Somme to the Moselle and along the frontier of Alsace-Lorraine.

MOTOR CYCLIST DESPATCH RIDERS TEN YEARS AGO.

The employment of motor cyclists as despatch riders for Army use is no new thing. The present use is rather a development and a perfecting of quite an old plan, and as long as ten years ago trials were made in this direction. The accompanying photograph was taken at the manœuvres in 1904, when the riders depicted were used to convey messages to and from the Duke of Connaught's staff, and did very well, allowance being made that machines were not quite so reliable in those days as in the present year of grace.

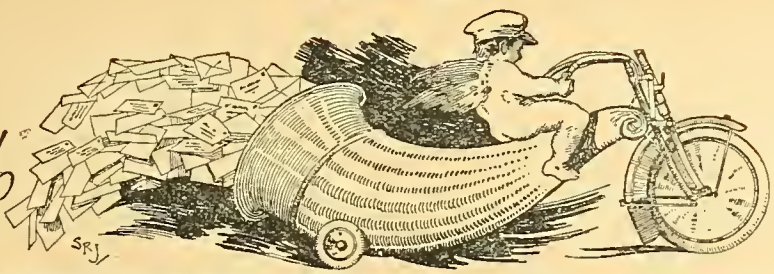
MORE RUSSIAN GOVERNMENT ORDERS.

The latest order placed by the Russian Government was for 350 Rover motor cycles exactly to standard specification, viz., with Sturmey-Archer gears, B. and B. carburetters, and Dunlop tyres. All are to be finished "service" colour, and must be ready to leave for Archangel with the other consignments from the different British makers. The Rover works are at full pressure and working over week-ends to cope with this urgent order.

Among the consignment of motor cycles, which will be leaving for Russia in the near future, for the use of the Army, there will be four hundred Rudge-Multis, finished, like all the others, a khaki colour. A. J. MacDonagh and J. C. Coultas are the two mechanics nominated to accompany the machines to Russia and take charge of them.

The Rudge Co. thoughtfully arranged for their attendants to receive a course of lessons on the Russian language immediately their mechanics had been selected. The pair are now busy mastering the difficulties of the Russian tongue.

Triumph machines for Russia will number three hundred. This was the most that the Triumph Cycle Co., Ltd., could prepare in the time limit, the Triumph works being busy with orders from all over the world. T. V. Harrison is to accompany the machines to Russia.



The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Owners' Experiences Wanted.

Sir,—May I ask if any of your readers in or about Crewe own the following makes and models of sidecars: Supreme, model No. 2; canoelet, model S3 or 4, or L3 or 4; Mills-Fulford, Corvette model. I cannot decide which I like best, and thought that perhaps some of your readers would not mind giving me their experience and also letting me see their machines if I called on them some time. H. LOMAS.

[Although we know that motor cyclists are always ready to assist others of the fraternity, we think our correspondent is asking rather much.—ED.]

"The Motor Cycle" for the Front.

Sir,—In the name of sixteen despatch riders attached to the 3rd Army, I beg you to forward a copy of your most valued and interesting publication.

We are absolutely in ignorance of things motorish, save the many trials we have here—reliability and many other.

Many of us have friends at home prominent in the pastime, and would like to know the happenings.

(Sergt.) M. H. THOMPSON.

British Expeditionary Force.

[Naturally, we have gladly fallen in with Sergeant M. H. Thompson's suggestion, and henceforward a batch of copies of *The Motor Cycle* will be posted to his base regularly. Since the outbreak of war copies of this journal have been sent weekly for the use of the Navy, and an official order has been received by our publishers for *The Motor Cycle* to be sent to France regularly for the use of the Mechanical Transport Section. Journals specially ordered are the only ones which reach the Expeditionary Force safely.—ED.]

Weights, Measures, and Coinage.

Sir,—One of the effects of the present war will undoubtedly be a large increase in our export trade, and we are of opinion that now is a very opportune time for us to consider the revision of our obsolete system of weights, measures, and coinage. It would greatly assist us in obtaining and securing new markets if we were to adopt the metric system or something similar. The motor and allied trades have for a considerable time worked on the millimetre system. There are, of course, some trades which could not immediately adopt this method, but we do think it would be to our advantage if for all export business we were to quote and invoice goods to foreigners in inches with multiples and decimals thereof, instead of as at present in yards, feet, and inches.

As regards weights, what could be more simple than to copy the American system, and to employ the 1 lb., the 1,000 lb. and decimals of a 1 lb., and thus obviate the complicated use of tons, cwts., qrs., lbs., and ounces?

Further, as regards coinage for the purpose of quotations and invoices, we could easily adopt the decimal system without necessarily altering our actual coinage. For instance, our present sovereign divides into ten florins, and if each florin be divided into one hundred cents it would be infinitely clearer to our foreign customers than the present method of £ s. d. One farthing is $\frac{1}{96}$th of a florin, and if we use the so-called cent as $\frac{1}{100}$th of a florin, the difference is so small that it could not possibly make any difference.

It only requires a moment's thought fully to appreciate the immense advantages of a method somewhat on the above lines. We have only roughly outlined the system, but doubtless some of your readers will be able to make some valuable suggestions of improvement. One way, perhaps, of dealing with the matter energetically would be to select a committee from the trade to formulate some system suitable to all concerned, and then place the whole matter before our Board of Trade with a view to its adoption. We shall be interested to have your readers' views on this important matter.

COMPONENTS, LTD.
HENRY JELLEY, Sales Manager.

Compressed Air Engines.

Sir,—Perhaps one of your readers would be good enough to inform me, through the medium of your excellent paper, why there is no compressed-air-driven motor cycle on the market at the present time, and if there is any likelihood of one being manufactured in the near future. Since we now have in our Navy submarines of 1,750 h.p., with a range of over two thousand miles, I often wonder why the idea cannot be applied on a smaller scale to motor cycles.

I have already seen a very neat little air-driven engine of ½ h.p., and it seems to me that if a strong high-pressure cylinder were substituted in place of the ordinary petrol tank there would be few other changes required. The advantages of a 2 h.p. motor cycle, capable of going even only twenty-five miles on one charge, are too numerous to detail here, but must be obvious to any motor cyclist who has experienced magneto, carburetter, and other troubles, which would be conspicuous by their absence in a bicycle such as I suggest. COMPRESSED AIR.

[Our correspondent appears to be confusing the torpedo compressed-air engine with the Diesel heavy fuel type or petrol-driven submarine engine.—ED.]

A Suggestion to Prize Winners.

Sir,—Will you kindly give me the publicity of your columns for making a suggestion to the prize-winners in the past motor cycling season. Many of the prizes have not yet been bought, for most clubs present them at a social function in the late autumn.

If we prize-winners combined to forego the actual prizes, and the value of them was sent instead to the Prince of Wales's National Fund, a very considerable sum would be raised for that purpose.

I feel certain that many of us would willingly accept a "scrap of paper" worded somewhat as follows: "The —— M.C.C. This certificate is awarded to —— in lieu of a —— won by him in the —— trial on ——, the value of the said prize having been sent instead, at his request, to the Prince of Wales's National War Fund."

This is a matter in which only the winners themselves can take the initiative. I appeal to my fellow prize-winners of this year to co-operate with me by writing at once to those clubs under whose auspices they have won prizes this year (exclusive, of course, of challenge cups), and ask them to do this. As a further development I would suggest that the clubs should all combine to pay the amounts thus raised into the National Fund in one lump sum. Perhaps the three unions would be willing to act as receivers for this purpose.

The only obvious objection I can see to the scheme, as a whole, is the loss of custom to the jewellers who usually provide the prizes. But this custom is spread over so many firms that the loss to any one firm would be negligible.

May I ask club executives to give this idea a chance of "catching on" before taking further steps towards the provision of prizes?

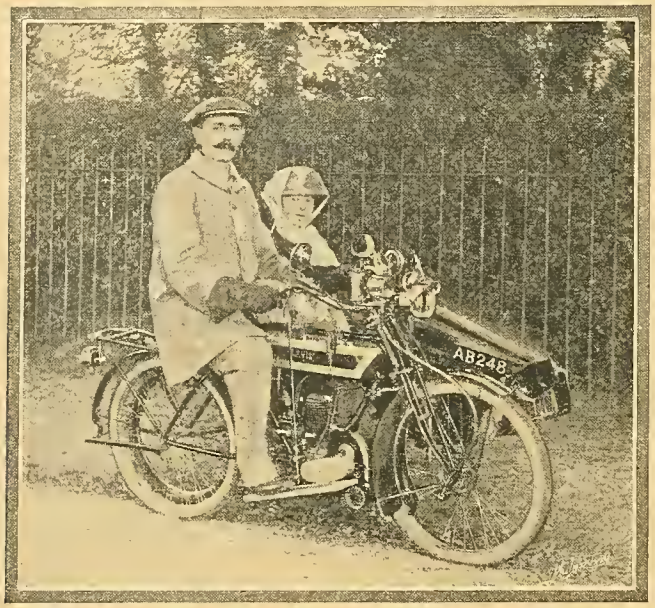
But the initiative lies with us winners. I have done my part—a poor one—a matter of only four medals. But if others will back it up, the whole idea will be very well worth doing.

(Rev.) P. W. BISCHOFF.

Lightweight Sidecars.

Sir,—I am enclosing you a photograph of my 2½ h.p. two-stroke, Albion two-speed, Levis motor cycle and light wicker sidecar, which I have now had a little over eighteen months. I have covered over 9,000 miles, and trouble is, and has been, practically nil. My petrol consumption solo is one hundred and thirty-five miles per gallon, and with sidecar about ninety, as, of course, it means more low gear on hills, but I can get up anything in reason. A few weeks ago I rode from Worcester to Weston-super-Mare with one stop for refreshments; in addition to my wife and myself we had a fair amount of luggage on the carrier, and climbed all hills. My average speed with sidecar is twenty miles per hour.

FRANK EVANS.



Mr. and Mrs. Frank Evans on their Levis sidecar outfit.

What are Ideal Handle-bars?

Sir,—I will venture to say that "Aysgarth" has never ridden in the T.T. race, nor can he claim to have ridden a thousand miles a week with *each* type of handle-bar. The semi-T.T. is the most uncomfortable of the lot, as anyone who has had *long* experience of the *three* types will confirm; for long rides, the touring bars are better than semi-T.T., but you must have a well padded springy saddle. The full T.T. is the best, with footrests; the saddle is not so important, as you do not rely on it to take the bumps, your legs being more adaptable to them than your spine.

Tank gripping is force of habit, and those who do it will find it more comfortable with knee grips; if the tank were not there I do not think you would find it any more difficult for cornering.

ALLEN S. JONES.

The Standardisation of Controls.

Sir,—*Re* your leading article on standardisation of controls. It is all very well to keep on crying out for uniformity, but who is to decide which is the best way for the levers to work. We all have our pet theory, and as long as two methods are marketed, so long will there be two sets of riders favouring opposite plans. Suppose you give the manufacturers a lead, stating definitely which is the better way. For my part I prefer opening inwards, because the levers are out of the way when the machine is wheeled backwards.

CL 806.

[Levers opening inwards are the kind favoured by *The Motor Cycle*.—Ed.]

Sir,—I was much interested to note your leader on this subject. I agree with the writer in thinking that the matter is one of very great importance, and I should like to be allowed to point out that the Engineering Standards Committee already have a sub-committee at work on the question of the standardisation of controls of motor cars, although a great deal remains to be done before any general agreement can be arrived at.

It would appear to me that the standardisation of controls of motor cycles would be a very much simpler matter than that of cars, and I would like to urge that any makers who are interested, and who would be willing at least to consider the question of standardising their controls, should communicate with the Secretary of the Engineering Standards Committee, Mr. Leslie Robertson, 28, Victoria Street, S.W.

BASIL H. JOY, M.I.Mech.E., M.I.A.E.

Sir,—*Re* your leaderette in the issue of *The Motor Cycle* for the 8th inst. The *necessity* of standardisation of controls cannot be over-estimated. For a considerable time I have been riding a machine fitted with one of our best carburetters. On the 8th inst. I was mounted on another machine, the controls of which operated opposite to those on my usual mount. All went well until I arrived at a most awkward hidden turn. Of course, as it usually *does* happen, a cart was in the middle of the road, just round the bend. "Force of habit" here prevailed, and instead of pulling up I made a terrific forward leap. Sheer luck only prevented what might have been a serious "smash up." As it was, I emerged without a scratch.

I thought it rather curious that, half an hour later, on opening *The Motor Cycle*, the first thing I should see was your leaderette. It seems a pity something cannot be done. The various makers of carburetters cannot say the matter has not been brought to their notice. I am quite sure the majority of riders favour standardisation, and, after all, they should be first considered.

UNIFORMITY.

Sir,—I quite agree with you regarding carburetter controls. I had one which opened from left to right, but I bought another on the day of leaving for my holidays which, unfortunately, opened from right to left, with the result that in an emergency I pulled the throttle wide open when I intended to close it, and had a nasty accident which nearly cost two lives. I was two weeks in hospital and my passenger nine, and neither will be quite well for some time.

E. TAVERNER.

Motor cyclist scouts attached to the Royal Devonshire Yeomanry stationed at St. Osyth Priory, Essex. The photograph was taken in front of the Norman gateway On the left is F. Weber (3½ h.p. Humber) and on the right W. N. Jubb (3½ h.p. Triumph).

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

An Air Release Wanted.

I have a twin vertical cylinder 2¼ × 3¼ Werner motor cycle. I have had the cylinders rebored and new pistons fitted, and now seem to get a great deal of compression in the crank case, which forces all the lubricating oil out of every little joint and causes the engine to overheat and stop within about two miles, there being no oil in the crank case, in spite of the quantity I inject.—P.K.

The remedy for your trouble is to have an efficient air release valve fitted to the crank case. This should be preferably of the non-return principle, and not a simple pipe.

Result of a Retarded Spark.

I am riding one of the 1914 3½ h.p. Douglas machines, and have run up against a rather knotty problem. The symptoms are that the exhaust pipes leading from both cylinders get cherry red hot after the machine has only run a very few miles. Everything is in order, and the engine clean. The funny part about the whole affair is that the heating does not materially affect the running. The presence of the mysterious ailment was only noticed by me the other evening after the machine had been taken down and I was out on a trial run.—W.M.M.

From what you tell us we should be inclined to think that the overheating of the exhaust pipes was due to a retarded spark. As you say it has only taken place since the engine was taken down, possibly the spark was inadvertently timed to take place too late.

Building a Two-stroke Engine.

I am desirous of building a light two-stroke petrol engine of 3½-4 h.p., air-cooled, as illustrated in *The Motor Cycle*, July 23rd, 1914, page 104. Could you tell me where I could obtain working drawings of this kind of engine and the probable cost?—C.G.

The design which you mention, illustrated in *The Motor Cycle*, is merely a rough design to illustrate the principle of the two-stroke engine, and, though it is approximately to scale, it may not be taken as a working design. You would find it considerably cheaper to buy a complete engine from a well-known two-stroke firm, but if you still desire to build one we should advise you to confine your attention to something rather smaller than a 3½ h.p., as the larger type has not yet been perfected and at present requires low compression with consequent bad fuel economy. It is possible that some two-stroke firms would supply you with working drawings, but we are rather doubtful on this point, and fancy that a consulting engineer or a competent draughtsman would have to be employed as designing for the public is outside our province.

Tyre Sizes.

Could you let me have your opinion as to the size of tyres for a 4½ h.p. Precision-engined sidecar combination, combined chain and belt drive? The specification includes 2¼in. tyres, but will these be reliable and satisfactory? What do you think of 2⅜in. size, or would 2½in. be much better? The reason I ask is that I have three very good covers and tubes on hand, 26in. × 2¼in., and I wondered whether to fit this size or sell these for what I can get and go in for 2½in. straight-away.—H.L.

Fit 2¼in. tyres if you can, failing this use the 2⅜in. size. The largest cover you can use will minimise tyre troubles and add greatly to your comfort. The 2½in. tyres require to be fitted to their own rims in most cases, but the 2⅜in. size fits the 2¼in. rim.

Loss by Fire.

I cannot solve the following points with my legal adviser with regard to garaging my motor cycle and sidecar, so should be greatly obliged if you can favour me with the information. (1.) I pay £4 per year rent for part use of a coach house, and in the event of fire should the owner of the house be liable for the value of my machine? (2.) Should the owner of the property insure the property to include the machines, or should the machines be insured separately by the owners of the machines? (3.) The adjoining property belonging to the same landlord is at present used as a military guard room. In the event of fire, in what position does the landlord or do I myself stand if the military accidentally set the place on fire through smoking or any other reason, and our machines are burned?—H.M.P.

As far as we can see the answer to (1) is: No. The owner of the house would not be liable for your machine. (2.) The motor cycle should be insured separately. (3.) If the place were set on fire accidentally, and neither the machines nor the building was insured, you would have to stand the loss yourself.

THE POPULAR SIDECAR IN THE ANTIPODES.

A Clyno team of four who obtained the greatest number of marks in the class for twin-cylinder machines in the North Canterbury (New Zealand) M.C.C. Reliability Trial. Rain, blizzards, and sand were among the conditions encountered in this severe trial.

Belt Slip.

I should be much obliged by an answer to the following queries: (1.) What is the best way of preventing or minimising slip in wet weather of a rubber belt? Are the preparations on the market for nsing on belt any good? (2.) Is benzole more difficult to start on than petrol if one injects a little first, and does it give as much power, seeing that they say the explosion is softer?—A.A.P.

(1.) The best thing you can do is to use a belt of the proper size and to have it reasonably tight; also have the pulleys of the correct angle. The preparations you refer to are for leather belts. (2.) It is, perhaps, slightly more difficult to start on benzole in cold weather (at other times there is no difference), but it is a satisfactory fuel if bought pure, and gives ample power.

A Repair Bill Query.

Some time ago I took my motor cycle, which was not running satisfactorily, to a garage to be overhauled. After the people there had finished I had a run on their trial ground, and told them the machine did not seem to be running as well as it should, so the mechanic took a large spanner and tightened a nut on the cylinder, and in doing so he cracked the cylinder. Now I have received an account for repairing the cylinder. I should be obliged if you would advise me whether I am responsible in regard to this account. The garage people say they have ample evidence that the cylinder was cracked before the nut was tightened, but this I do not believe.—A.A.

The details you give us are so meagre that it is difficult to give a decisive opinion of your legal position. We should say, however, that the repairer will be able to recover his charge from you for the repair, but if, as you allege, his mechanic carelessly broke the cylinder, we should think that your best plan would be to wait till he sues you, and then counter-claim for the damage to your cylinder, but before doing this you will, of course, have to be in a position to prove that the mechanic did actually break the cylinder through misuse of his tools or through unskilfulness, and with regard to this we note that the repairer states that he is in a position to prove that the cylinder was cracked before the actual breakage occurred. Under the circumstances, we should think that your best plan would be to meet the repairer and settle the matter in an amicable way.

Tuning a Two-stroke.

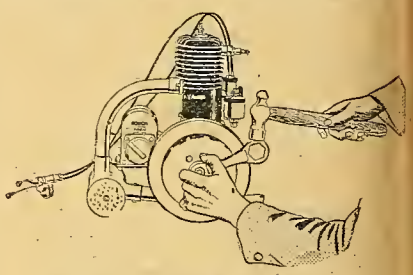
I own a 2½ h.p. Alldays two-stroke machine (Villiers engine) which ran perfectly until quite recently, when it developed the following complaint: It starts very badly, the exhaust being woolly. It sometimes stops altogether, but, as a rule, after running about eighty yards the engine runs perfectly. It also does only about twenty-eight miles per hour all out, as compared with about thirty-nine before it developed its complaint. I have tried everything I can think of, different jets (Amac carburetter), but have returned to a twenty-eight, tested the level, raised and lowered it, tested ignition timing, cleaned out silencer, and thoroughly cleaned the whole engine, but all in vain. The machine will not look at hills now, which it used to climb easily, which looks like bad compression, but the latter is very good. I have taken it to two good mechanics, but they were unable to make any improvement. —D.G.H.

Your trouble may be due to one of several causes, but in all probability you will find that the top piston ring is sticky in the groove. The ring should be removed, and all traces of carbon scraped off, especially at the back of the ring and on the sides of the groove. We feel sure that this will cure your trouble, but if not, see that the exhaust port is quite clear, as this sometimes chokes up with a very hard deposit, which almost resembles cast iron at first glance. Also, make sure that your crankshaft bearings are sound, and that there is no loss of compression from the crank case, as this is a very important point. [The above reply was posted to "D.G.H.," and we have since heard that our diagnosis has proved correct, the trouble being a stuck piston ring. When this was freed the machine ran perfectly.—ED.]

READERS' REPLIES.

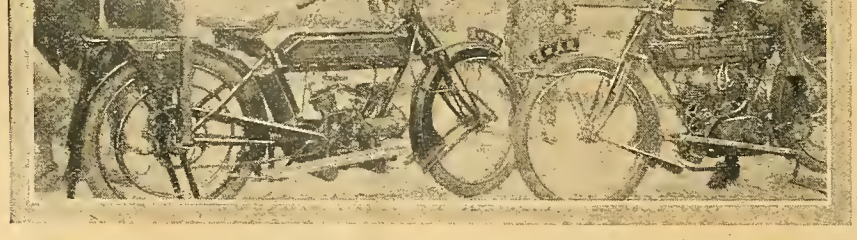
Consumption on Two-stroke.

Referring to your "Questions and Replies" page in your issue of October 1st, I should advise your correspondent "E.A.H." to hammer up very tightly the nut of the outside flywheel on his two-stroke engine. From experience and knowledge of two-strokes, of other than those of our own make, I should say the knock he complains of is due to the flywheel being loose on the taper of the crankshaft. Considerable damage will result if the flywheel is allowed to remain loose.—ARTHUR BUTTERFIELD.



Showing the manner in which the nut securing an outside flywheel should be tightened. After screwing up as tightly as possible by hand, a ring spanner should be used, and "jarred" up dead tight by hammering, care being taken that there is sufficient thread on the end of the crankshaft remaining within the face of the flywheel boss to allow the wheel to be forced dead tight upon the taper.

Observing the remarks of "E.A.H.," regarding his experience with his 2 h.p. two-stroke, I thought it might be interesting to give my experience with a similar type of machine. I have been running a 2¼ h.p. Radco since Easter, and my experience has been very different as regards petrol consumption. At first I could not get more than eighty to ninety miles per gallon, but after running it for a couple of months I got the "hang of the thing" better, and my mileage per gallon considerably increased, and now I can get one hundred and thirty miles per gallon on average roads. At first I used a 25 jet, but after three or four hundred miles I replaced it with a 24, and I have had this in ever since. I can run on full air and throttle about a quarter open, and it does not four-stroke at all, and after running thirty or forty miles it seems to be just getting into the "stride" and runs better than ever. I have now ridden nearly 2,000 miles, and have several times gone into Devonshire, but have had no pushing up hill to do. The machine is a fixed gear, 6 to 1, and the only thing I find wanting is a two-speed gear, not that I have had any trouble with hills, but when running at thirty to thirty-five miles per hour the r.p.m. are rather high, and I notice considerable vibration. If I had a two-speed, say, 4½ to 1 and 8 or 9 to 1, I think I could go anywhere on it.—TWO-STROKE ENTHUSIAST.



British motor cyclists in China. The machines depicted are a 3 h.p. and a 2¾ h.p. Enfield. Note the registration numbers in Chinese characters.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. ooo, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

The Motor-cyclist's "ally"—

In his fight with that deadliest of all enemies—VIBRATION—the Motor-cyclist will find a powerful and all-sufficient ally in the shape of the

"DRUID" Spring Fork.

Scientifically designed, and constructed of the finest and most suitable materials, the "DRUID" completely accomplishes the purpose for which it was introduced—so much so, that all the ill effects caused to the rider by the irregularities of the road surface are entirely obviated.

In your own best interests, therefore, YOU should specify the "DRUID," and, moreover—INSIST on your mount being "DRUID-equipped"—'tis the ONLY way to ensure the "ALL-SMOOTH" road.

A. DREW & Co., Ltd.,
Leopold Street, BIRMINGHAM.

Bear in mind that the winning (A.J.S.) machine in the 1914 JUNIOR T.T. RACE (I.O.M.), and that 5 out of the first 6 machines home were fitted with "DRUID" Forks.

Despatch Riders and their Weapons.

SINCE the outbreak of war, we have from time to time urged the desirability of rifle practice and made suggestions which have been largely taken up by motor cycle clubs, but one or two cases of which we have heard lately, brought home to us the fact that it is even more necessary for motor cyclists to practise with the revolver. In the first place revolver shooting is in itself much more difficult than rifle shooting, and, consequently, more practice is required before a man can be called proficient, and in the second it is much more likely to be useful to motor cyclist despatch riders, who are always armed with the smaller weapon.

The recoil of the service revolver is quite considerable, and throws a great strain upon the user's wrist, especially if not held correctly, as, owing to its shape, the barrel tends to fly upwards when it is fired, and beginners nearly always fire very high in consequence.

We have lately met with two despatch riders invalided home from the Front, one of whom accidentally put a bullet into his own leg by mishandling his revolver, and the other exaggerated the case by stating that he hardly knew from which end the bullet emerged. We should have imagined that a motor cyclist, accustomed as he must be to machinery, would have had but little difficulty in mastering the mechanism of a simple weapon like a revolver in five minutes, but our point is that both these men would have benefited immensely by instruction and practice.

Several hundred motor cyclists are still on the waiting list, and hoping to be called upon to serve their country as despatch riders, and these men would be far more serviceable if they could spend some of their time in the interval practising the use of a revolver. A suitable range does not present the same difficulties that a rifle range does: twenty-five yards is sufficiently long, and it should be an easy matter to fit out a range in every town. We suggest that the War Office should take this in hand, and provide a few revolvers to give men on the waiting list an opportunity of accustoming themselves to the weapon which they will have to use when the time comes, and thus become a danger to the enemy rather than to themselves. If it could be arranged that shooting practice from the saddle and at full speed should also be obtained, so much the better.

Christmas Gifts for Motor Cyclists at the Front.

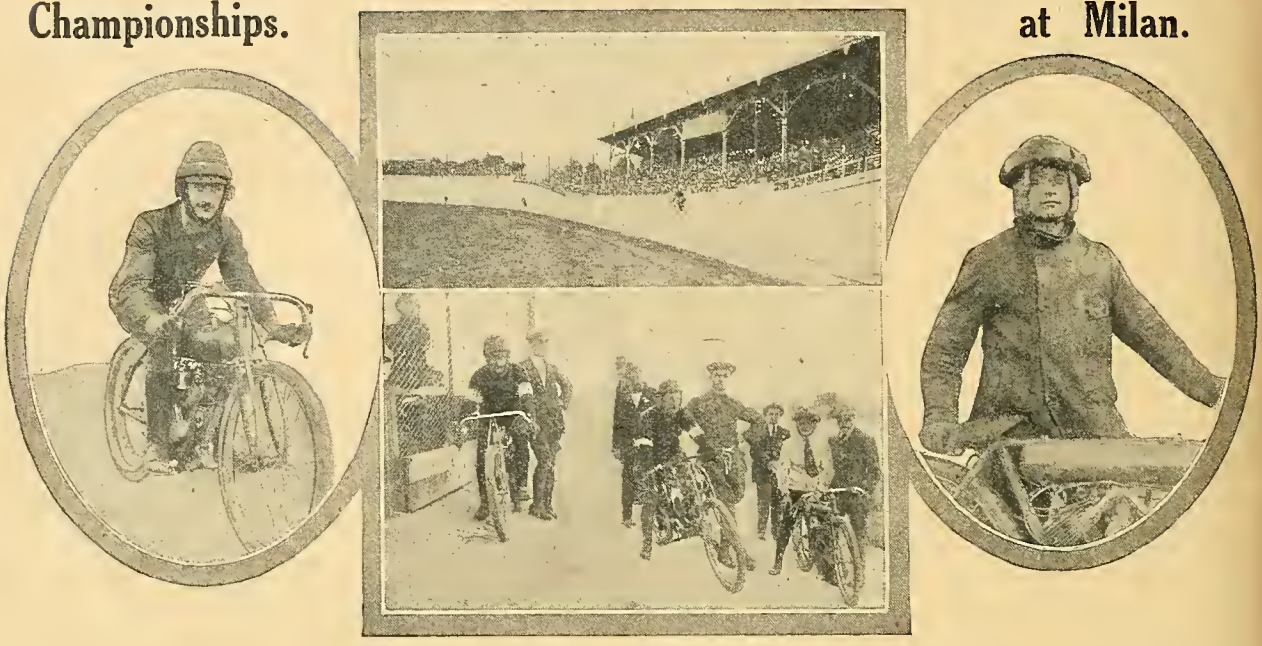
THIS week we announce a "Shilling Fund" with the object of purchasing useful Christmas presents for motor cyclists on active service at the front. It needs no further words of ours to lay stress on the value and utility of the motor cyclist in his important work as a despatch rider; his worth is now known to everyone, for commanding officers have time and again emphasised the useful service rendered by the despatch rider. Various funds have been opened to buy tobacco, cigarettes, plum puddings, and the like for our men at the front, and the Christmas gift scheme is nobly led by H.R.H. Princess Mary.

The fund opened by *The Motor Cycle* will be devoted to the purchase of small but useful articles such as gloves, mufflers, handle-bar muffs, warm socks, and abdominal belts, but of this more anon. The Rev. P. W. Bischoff's suggestion, published in the last issue, to allocate prize money to the Relief Fund was a happy one, and we think that those readers who have won awards in competitions during the past year would willingly forego the whole or part of the prizes, so that some of the purchase money may be used as we have outlined.

Busy factories, influential clubs, and readers in general will, we feel sure, welcome this opportunity of showing their appreciation of motor cyclists' work at the front, and send donations of a shilling upwards.

Italian Track Championships.

Interesting Racing at Milan.



THE ITALIAN TRACK CHAMPIONSHIPS AT MILAN.

(1) Carlo Maffeis, the winner of the 500 c.c. class.

(2) A view of the track showing the final of the 350 c.c. class in progress. (4) A lady motor cyclist in the 500 c.c. final. Left to right: Carlo Maffeis (Moto Reve) the winner, Alfredo Belfanti (A.B.C.) second, and Miss Vittorina Sambri (Borgo).

(3) Merlo, winner of the 1,000 c.c. class.

THE Italian Motor Cycling Track Championships were held this month at the Milan saucer track, one lap equal to 401 yards. Though the entries were not numerous, they included the best Italian riders, and all the events were very interesting and closely contested.

350 c.c. Class.

Four entries. After two heats, three rode in the final (10 km.). Result:

1, B. Badino (Douglas), in 7m. 5⅗s.; fastest lap in 14⅕s. (speed 57.8 m.p.h.)

2, M. Maffeis (Motosacoche).

3, Bernardinelli (Douglas).

500 c.c. Class.

Eight entries. After four heats and three semi-finals, three rode in the final (10 km.), with the following result:

1, Carlo Maffeis (Moto-Rêve), in 6m. 7⅖s.

2, Belfanti (A.B.C.), in 6m. 14⅖s.

3, Miss Vitt. Sambri (Borgo).

This was the most interesting event of the day, and the final was most exciting. Maffeis on the inside got away first, closely followed by the Italian lady rider, Miss Sambri, and Belfanti (A.B.C.) lying third. Maffeis soon gained nearly half a lap advantage, but Belfanti, who in his heat had clearly demonstrated that his machine was very fast by covering the fastest lap in 12⅖s., which is the record up to the present and represents a speed of 66.15 m.p.h., was gathering speed at every lap, and fast approaching Maffeis, but to do this he had to pass Miss Sambri, who, unable to hold her machine, kept swinging towards the outside of the track. Once they bumped together, and a fall was most cleverly avoided by Belfanti, who, however, had to pull up. Once again he tried to pass, but could not get through for the above mentioned reason, till at last Miss Sambri's machine shed the belt, and this caused her to retire. It was, however, too late for Belfanti to catch up Maffeis, and he had to be content to finish half a lap behind, both riders being heartily cheered. This is the first appearance of an A.B.C. machine in Italy, and the makers and agents may well be pleased with its performance.

1,000 c.c. Class.

Two heats and a final of 10 km. Four entries.

1, Merlo (Frera), in 6m. 33⅕s.; fastest lap in 13s. (speed 63.1 m.p.h.)

2, Carughi (Frera).

3, Rava (Borgo).

This also promised a very interesting event, as Merlo, who had been beaten in his heat by Rava, got away in front, and Rava was doing his best to get up to him when he shed a belt, and before he could get going again Merlo was too far away.

Maffeis and Merlo are now champions for their respective classes for the third consecutive year.

THURSDAY, NOVEMBER 19th.

THE MOTOR CYCLE ANNUAL BUYERS' GUIDE OF 1915 MODELS.

ENLARGED ISSUE. NUMEROUS ILLUSTRATIONS.

OCCASIONAL COMMENTS BY IXION

A Piston Ring Tip.

The bore of an ordinary circular push bicycle trouser-clip is exactly 60 mm. [What on earth——?—Ed.] Therefore it is just the tool for compressing the piston rings of whichever two pistons are first "entered" in replacing the *monobloc* casting of a four-cylinder cycle car. If you have the type fitted with a spring lock, it is very handy when you are decarbonising a Morris-Oxford engine and other small projectiles of similar dimensions.

Pressed Steel for Sidecar Frames.

The pressed steel frame for sidecars has already been dealt with in these pages, and certainly this year's trials have proved beyond dispute that more attention must be paid to the design of sidecar frames. Not long ago a car designer experimented with a steel pressing which included not only the frame, but the lower halves of the crank case, gear box, and silencer. His idea suggests that it might be possible to construct a pressed steel sidecar frame, one edge of which could compose the lower half of the bicycle frame as well, so obviating all connectional difficulties.

Drip-feed Oiling.

A North-countryman sends me an exceedingly interesting letter on the subject of drip-feed oiling. He has ridden a first-class engine for some years past, and this year the maker whom he favours adopted drip-oiling. Whereas in previous years he had normally obtained about 9,000 miles from his connecting rod bushes with pump oiling, this year he has failed to make these bushes last more than 3,000 miles under drip oiling. He admits that several conclusions are possible, but the one he favours is that the cooling effect of a full charge of oil, suddenly injected *en bloc* every eight or ten miles, makes for longevity of the bearings. His impression is that the steady drip of the more modern system robs our grossly overworked big-ends of this cooling flood, and that they consequently give up the ghost much earlier. I have heard similar opinions from other users, and I have had two experiences which point in the same direction myself. But I rather resent the deduction. He implies that we must prefer a bad lubrication system in order to maintain bearings grossly inadequate for their duties. The ideal surely is that we should perfect bearings and lubrication system alike. It is probably true that the drip-feed is not suited to engines which have no margin of safety in their connecting rod bearings; and riders of such badly designed engines should try opening the regulator, and using their drip as a plain pump feed after replacing the first set of bearings. *Pour moi*, I shall stick to the drip, and see that I do not use it on an engine with microscopic bushes.

Metal Clips for Ignition Wiring.

Three times this year I have been hung up with chafed high tension wires, due to the cable being damaged by the fitter forcing it into a metal clip on the lower top tube of the frame. In each case the trouble occurred with a brand new machine of good make. Of course, the little *contretemps* did not worry me, but I can see that it might be very tiresome for a raw novice; except by the "finger" test, of which many are nervous, spark testing was far easier in the old accumulator days than it is now. Even if these wires are properly fitted, there is always danger of the cable being injured when it has to be removed from these pinched metal clips, and I think the time has come for the trade to abandon them. Insulated clips are cheap to make and easy to fit. Why should not the magneto makers supply one with each cable?

Cleanable Sparking Plugs.

I am rather surprised that so few designers fasten on the idea of a "cleanable" sparking plug. The mounting of electrodes and the material of the insulators are now almost above criticism; in the early days we suffered from cracked porcelains and broken wires, but to-day plug trouble is practically confined to sooting. It is a very tricky job to clean a plug which has a rigid cement joint between its metal socket and its insulator. The butt of the fixed insulator is irregularly shaped, is buried deep inside the socketed metal head, and is largely screened by the substantial electrodes. One washes the head in petrol, scrapes it with a knife, scrubs it with a stiff brush, but the bulk of the layer of carbon still defies removal. Even if one goes to the trouble of teasing out the end of an old piece of Bowden wire into a tiny brush, it is impossible to remove the black deposit; indeed, one may almost say that the inaccessible fastnesses of the plug have been "stove enamelled with burnt oil," and the worst of it is that the errant current will prefer a path along the carbon deposits to leaping any great resistance at the point, while any surviving carbon layers serve as a field of attraction for fresh deposits, so that a plug, once sooted, rapidly soots up again.

Threequarter Inch Belt Fasteners.

Until the modern light machines came into vogue, I had hardly used a ¾in. belt for several years past, though in the old days I covered many thousands of miles on ¾in. and ⅝in. belts with the plain hook fastener. I find that some manufacturers fail to grasp the special problem presented by the modern plate fastener in conjunction with a ¾in. belt on a light-weight machine. Supposing the width of the end plate be half an inch, its edges can only clear the pulley by ⅛in. on either side at the very best. If the frame be

Occasional Comments.—

even a trifle out of truth, or apt to whip, if the rear belt rim be mounted a shade out of truth or become strained, if the fastener be carelessly fitted on the skew, if the back wheel be not adjusted absolutely plumb in the rear forks, the edges of the end plate are bound to foul the pulley flanges. With a really silent engine, a fastidious owner would soon spot the periodic tinkling noise, and look into matters; but many owners are novices, and the miniature engine is, on an average, less silent than its bigger sisters; the small two-stroke, in particular, is apt to produce a loud burr reminiscent of a Gnome engine. So the fasteners often foul—have I not heard them often when miniature machines pass me on the road? The unfortunate owners suffer from belt troubles, and their pulleys get damaged. The designers of belt fasteners would do well to produce ¾in. fasteners with very tough and *narrow* end plates. Moreover, the designers of lightweights should pay very special attention to the trussing and alignment of their frames, to the mounting of their rear belt rims, and—I even dare to make the suggestion that a one-position fixing of the rear wheel may prove to be desirable. Duffer owners will always get their rear wheels out of truth when slotted fork ends and draw bolts give them an opportunity.

Twin Belt Drive.

I have had an interesting letter anent a form of transmission which many folk deem obsolete—the twin belt drive. My correspondent lives in a heavy district, and uses the twin belt drive on a 1913 8 h.p. Matchless-Jap with sidecar. He says that a pair of Dunlop ⅞in. belts run 10,000 miles without giving any real trouble, and that the back tyres last over 4,000 miles apiece. His sole difficulty has consisted in rapid wear of the bearing on the low gear side of the V.S. hub, and he has now traced this defect to the wheel being out of truth. It hardly seems possible that this drive should regain prominence, but it is unquestionably far smoother than the popular combined or chain drives, and if it proves so reliable and economical with a 1,000 c.c. engine and heavy load, its merits may well deserve further consideration. Of course, it is assisted by a big engine pulley in his case, though he does not state the diameter of his pulley. I wonder whether the twin belt may prove to be the sweetest drive for a single cylinder sidecar outfit. The twin can stand the comparative harshness of the combined and chain drives, so noticeable in slow running or picking up on single cylinders; but in my opinion the single cylinder leaves something to be desired with the more rigid transmissions.

The Scott Sparking Plugs.

During the last week or two I have been amusing myself with a Scott machine, amongst others. The Scott Co. advise their clients to use none but an American plug, known as the "Reliance," which possesses several unusual features. It has a porcelain insulator, which is certainly less durable than steatite. It has a metal dome end, after the fashion of the "Reflex" plug, and through a central hole, drilled in the head of this dome, projects a wee thin wire of platinum-iridium alloy, which never breaks, never becomes incandescent, and does not burn away. But its genuinely interesting feature is that the joint between metal socket and porcelain insulator is a screwed joint, devoid of cement, so that the plug can be taken to pieces and thoroughly cleaned. To do the plug justice, it seldom soots up, for the metal dome largely prevents oil from penetrating through to the surface of the porcelain insulator beneath; but if it does soot, its pristine whiteness can be restored in a minute or two, for the whole business end of the porcelain can be exposed and polished absolutely clean. This is a most excellent feature, especially as the screwed joint is tight enough to prevent compression leakages, and oil stains, due to "blowing through," are not experienced. Furthermore, the plug has a rational provision for adjusting the sparking gap. I have no doubt that the leading British plug experts will rend me in pieces for my crude praise of a foreign article; but I reiterate that the average motor cyclist wants a "cleanable" plug, and I see no reason why his request should be met with a negative. Cyclecarists say the same, only more so, for it is likely that they suffer more from oiled-up plugs than motor cyclists do.

ILLUMINATED ROAD SIGNS FOR MOTORISTS.

THE A.A. and M.U. has already erected many thousands of road signs along the main roads of the United Kingdom. A new A.A. departure is the provision of illuminated signs for guiding motorists at night.

The illustration shows an illuminated road sign fixed over the A.A. roadside telephone box at London Colney. Coming from Coventry through the village, the box is seen at the junction of the forked roads. The left road leads to London, while the right road is simply a by-road into the village, though at night it might easily be taken for the main road.

This illuminated sign, which has been erected and will be maintained at the expense of the Association, should remove all danger of motorists getting into difficulties at this point when driving towards London after dark.

An A.A. illuminated sign recently erected at London Colney

REVS: A Sermon for Speedmen.

("I will remedy this gear ere long."—*Shakespeare.*)

NO doubt, like Oliver Twist, you ask for more. This being so, the chief thing to guard against is the exploitation of a high gear somewhere in the attractive neighbourhood of four or even three to one. Several years back the writer made the experiment of lowering the gear on a 7 h.p. single-speed twin from 4 to 1 down to 4¼ to 1 (this machine had 28in. wheels), and obtained exactly the same road speed with a faster average, owing to the increase of power on hills and to more rapid acceleration.

The truth is that with most motor cycles (there are, however, several exceptions as regards gearing high) the power falls off considerably after a certain limit has been reached.

Supposing your engine, a fast one, can turn over at a rate of 4,000 revs. per minute. Probably its greatest power will be given at a speed of about 3,000 r.p.m., or perhaps at a speed of 3,500 r.p.m. Now, with an engine speed of 4,000 r.p.m. and a gear of 4 to 1 we get a 26in. machine travelling at 77.2 miles an hour.

But first get your revs.; I mean, get the engine to turn over at (say) 4,000 r.p.m. whilst indulging in those bursts of speed that never fail to endear you to other "users of the road"—a generic term for motorists; pedestrians, sober or thereabouts, as the case may be; police with the latest in Swiss stop-watches; horsed vehicles (occasionally), poultry, pigs (thank heaven, not porcupines), and dogs (age, sex, and size unlimited). What with your valves ground flat on top, narrow seatings, extra stiff valve springs, a perfect carburetter, and good engine balance, you expect to hold your own against all other brother road hogs.

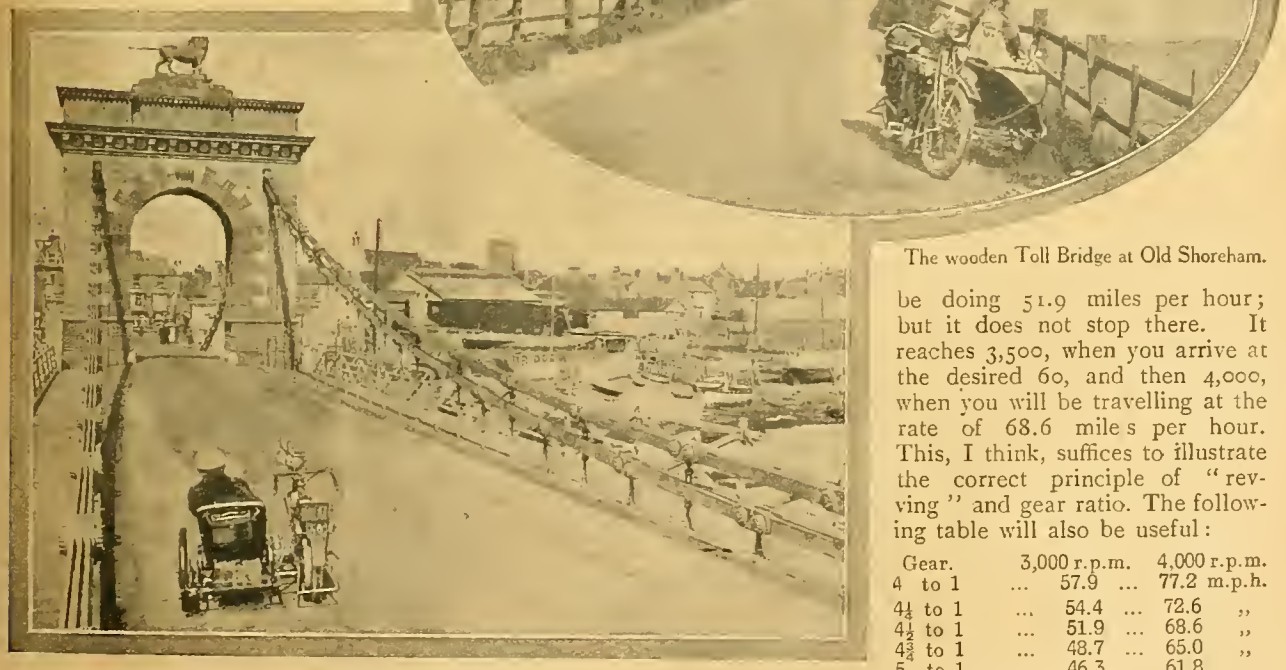
The Advantage of High R.P.M.

Now as regards your gear ratio, what you have to consider—and, in the case of a would-be world's record holder, I suppose, to determine—is the power curve of your engine. At best, you find that on a 4—1 gear your 3½ h.p. Supercylinder will propel the machine at 57.9 miles per hour. In other words, your engine remains at 3,000 r.p.m., and it does this because at higher engine speeds the power begins to fall off, and since the extra resistance is too great in proportion to this falling off in power, you remain at merely 57.9 miles per hour. Your engine may yield at 2,000 r.p.m. (say) 6 b.h.p., at 3,000 9 b.h.p., at 4,000 8 b.h.p. (the figures are only for illustration). On a gear of 4 to 1, therefore, you are not using the extra 1,000 r.p.m. of which your engine is known to be capable. You cannot touch 60. Boldly lower your gear to 4½ to 1 and then make your attempt. This time, when your engine speeds up to 3,000, you will be doing 51.9 miles per hour; but it does not stop there. It reaches 3,500, when you arrive at the desired 60, and then 4,000, when you will be travelling at the rate of 68.6 miles per hour. This, I think, suffices to illustrate the correct principle of "revving" and gear ratio. The following table will also be useful:

Gear.	3,000 r.p.m.	4,000 r.p.m.
4 to 1	... 57.9	... 77.2 m.p.h.
4¼ to 1	... 54.4	... 72.6 ,,
4½ to 1	... 51.9	... 68.6 ,,
4¾ to 1	... 48.7	... 65.0 ,,
5 to 1	... 46.3	... 61.8 ,,

SINGLECYL.

A CONTRAST IN TOLL BRIDGES WITHIN HALF A MILE OF ONE ANOTHER.



The wooden Toll Bridge at Old Shoreham.

Norfolk Toll Bridge, Shoreham.

A Season on a T.T. Douglas.

By ROAD RIDER.

THE reputation of the Douglas resembles that of the British Army—it is known all over the world, and respected by all its rivals. But I have never seen in print an appreciation of the machine from the most interesting standpoint of all, namely, how it is likely to serve an inexperienced owner who has yet to acquire the knowledge which can keep a machine in perfect tune.

My Douglas was delivered last January, and has been treated as a common hack. It has been loaned to all sorts and conditions of men, including novices; indeed, one novice was allowed to cover several hundred miles on it when I was personally busy with other machines; and it has never received any precautionary attentions at all. In other words, it has been ruthlessly handled by myself and clumsily handled by several other people—treatment calculated to bring out any intrinsic weaknesses.

The trouble catalogue for the season includes a broken valve rocker (replaced gratis), two or three chain "snappages," ascribable probably to novice drivers abruptly throwing the full engine power on to the transmission uphill, and a sooted plug or so.

Maintenance of Power.

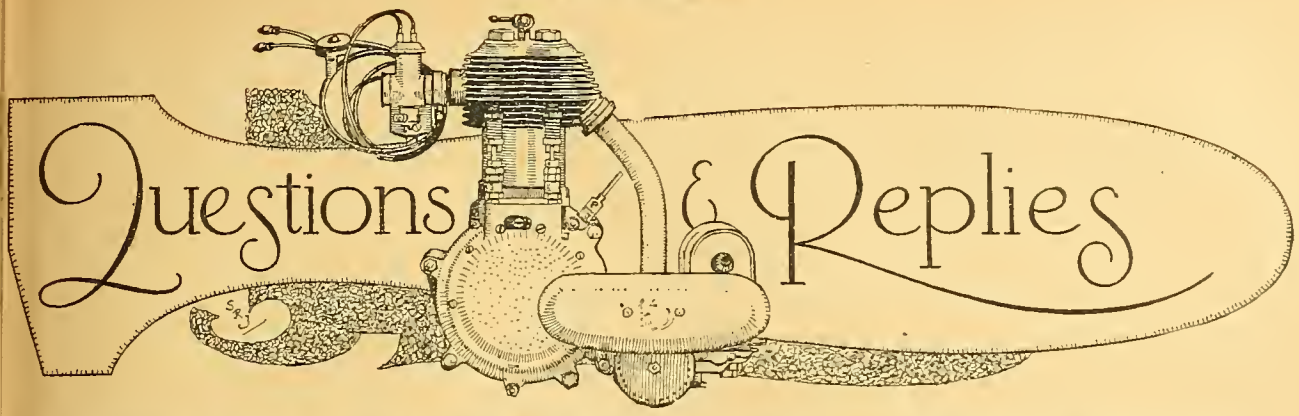
The power and efficiency have been extraordinarily well maintained. It is rather a tiresome job to clean the carbon out of the cylinders, as the engine must be removed from the frame for the purpose, but, thanks to the drip feed lubricator, I have not found it necessary to tackle this job until the engine has done 3,000 miles. Indeed, at the present moment the cylinders contain the carbon deposits from 3,500 miles, and the engine is running well; they must be moderately heavy, but it neither knocks nor overheats, though the compression is a little weak. The valves *require* grinding in at similar intervals, though a careful owner would touch them up every 2,000 miles. I find that if the engine receives no attention whatsoever for 3,000 miles, the machine can still average thirty miles per hour on average roads, climb gradients up to 1 in 5, and cover 110 miles on a gallon of petrol. This is power maintenance of a very high order, and after reliability, power maintenance is the chief merit from a private owner's standpoint.

On the Question of Economy.

The machine is, further, extremely economical to run. The life of the belt is 5,000 miles, thanks to the two-step drive; and, during that life, there should not be more than three belt stoppages, including "stretch" and fastener troubles. The studs on the back tyre provide an effective non-skid for 2,000 miles, and the tread is trustworthy for a further 2,000 miles after the studs have gone, when the tyres should be changed over. On roads free from flints a single pair of tyres last from 5,000 to 7,000 miles. The chain begins to be dubious after 3,000 miles, though it would last longer with uniformly skilful driving. The petrol consumption averages from 100 to 125 m.p.g. in fast touring work, though it would be much less with the size of jet desirable for a Six Days Trial. Starting is always childishly easy; the machine invariably paddles off from cold in a couple of yards without petrol injections. None of the fittings have broken or shaken loose, or given any trouble. Such fragile items as valve cotters and springs possess extraordinary durability.

To sum up, the machine would have realised the absolute ideal of a light handy machine for rough usage by a duffer, were it not for the broken valve rocker, which has been the single blot on a very fine record. The rocker broke when the machine was out on loan, and, as the part showed no flaw, I am inclined to think that a valve jammed up through expansion of the stem when the engine was being overdriven with the guide half choked by filth. It is impossible to praise the outfit too enthusiastically.

Mr. Dennet Huggett, with the pedal bicycle and twin-cylinder Clyno motor bicycle which he won in the Robbialac enamelling competitions of 1909 and 1913 respectively.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Rear Lights on Sidecars.

I have purchased a 6 h.p. Royal Enfield motor cycle and sidecar. Do I require a rear light?—E.C.

All sidecar combinations are required by law to exhibit a red rear light.

Band Brakes.

Can you advise me of any remedy for a band brake (external) which to all appearances is adjusted properly, but does not grip as it ought to? I have tried fullers' earth with little or no effect. I have examined the Raybestos lining, and find that it is in sound condition.—H.S.

We are afraid that there is probably something wrong with the design of the brake. If the diameter of the drum is too small and the width too little you will not get the stopping power you ought to have.

Attacked by a Dog.

Will you kindly inform me whether I can enforce my claim of £5 for medical and hotel expenses and loss of business, consequent upon being laid up for one week? Whilst motor cycling I was attacked by a bull terrier dog which bit my foot, his teeth penetrating the upper part of my boot and injuring my toes so badly that I was bound to have medical advice and stay in an hotel in the town for the night, and was unable to follow my business as a traveller for one week. The owner was with the dog and witnessed the incident, and in conversation promised to pay my doctor. This is not sufficient for me. It is the first occasion the dog has been known to bite anyone, and I should value your advice as to what chance I stand of enforcing my claim in a court of law.—W.W.

To enable you to bring a successful action against the owner of the dog, it would be necessary for you to prove that the animal had previously attacked people, and that the owner had been acquainted with this fact, but as you say that this is the first occasion on which the dog has been known to bite anyone the action would in all probability be dismissed. You would be well advised, therefore, to accept the owner's offer.

Exemption from Taxation.

I have been an owner of a sidecar machine for two seasons, and now I have bought a 2¼ h.p. mount to carry me to and from my work. Shall I have to take out a licence for this machine as well as the other, as I wish to keep the large one for pleasure only and the small one for my work?—P.M.

There is no exemption from the local taxation licence except when the machine is used solely for the purpose of carrying goods and merchandise. If taken out after October 1st the cost will be only one-half to the end of the year, *i.e.*, 10s., and, of course, only one driving licence is required.

Two-strokes.

After seeing your two-stroke number last July, I thought of getting a two-stroke, but am quite at sea with hearing various opinions as to what to do. (1.) Would a single-speed two-stroke pull me up the steep hills round Sheffield, or would it be necessary to have a two-speed? One does not want to have to rush hills to get up. (2.) I have heard that two-strokes consume much more petrol than four-strokes. How would a 2½ h.p. compare with a 2¾ h.p. Douglas for consumption? (3.) Would a two-stroke stand a good long run, say, of 150 miles in a day, or would it get very hot? One reason I wanted, if possible, a two-stroke is that one has not to bother with valves, etc., not that it puzzles me, but purely on account of having a mount over which I do not have to spend much time beyond my cleaning the cylinder.—W.G.W.

(1.) We should strongly advise a two-speed gear for use in the neighbourhood of Sheffield on a low-powered machine. (2.) The consumption of petrol on a two-stroke used to be very excessive, but this has been much improved, and it is now possible to get a very good mileage per gallon. The consumption would be about the same. (3.) Any good two-stroke machine would easily accomplish a run of 150 miles in a day. It should not be hotter after that distance than after a run of five miles or so.

Licences.

I hold a licence to keep a motor car (£4 4s. tax). I have now sold the car and bought a 7 h.p. Indian cycle. Will my licence to keep a car cover me this year for the cycle, or must I take out a new licence for the motor cycle?—C.B.

In this case the greater includes the less, so that no extra licence is necessary for you this year.

Choking.

My machine (a 5 h.p. automatic valve twin) will take only quarter throttle. Both inlet valves are free in guides, and I use a No. 32 jet. Directly I open throttle it stops. What do you suggest I should do in the matter?—J.W.H.

It looks as if you have too large a jet, and when you open the throttle the extra flow of petrol causes too strong a mixture, which causes the engine to choke. We should advise you to try a No. 30 jet, and open the throttle gradually, opening the extra air at the same time. It is possible that your inlet valve springs are too weak or the lift too great. 3/32in. or 1/8in. is about the required amount and more might cause the trouble.

Petrol Consumption.

I have a 7 h.p. twin sidecar combination. I can only get forty miles to the gallon, solo or with sidecar, over good roads. (1.) Do you consider this a reasonable mileage? (2.) Do you advise security bolts for front and back tyres and how many? (3.) What can you recommend for side-slip for solo and sidecar work, as I find the machine slips badly on grease when ridden solo?—TWIN.

(1.) As you are using a big engine you must not be astonished at the fairly high consumption, especially if you travel fast. It should, however, be about fifty miles to the gallon. Give the engine plenty of air. (2.) One security bolt in each wheel should suffice. (3.) We should recommend you to get a good ribbed or studded tyre or a combination rubber and steel-studded tyre

Starting Difficulties.

I have recently been puzzled by the behaviour of my 1914 2¾ h.p. twin. (1.) When the carburetter is flooded very slightly for a start petrol drips out of the base of the jet chamber and air extension pipe for a considerable time while the machine is standing. I have overhauled the carburetter, tightened all screws, and checked the petrol level in the float chamber. (2.) Often in starting, the engine back fires and a flame blows out of the carburetter air extension pipe, and in several cases the carburetter has caught fire. I have checked the valve and magneto timing, and find it according to the manufacturers' setting. The valves work freely in their guides, and close correctly, the space between bottom of valves and tappet being the thickness of a visiting card. The carburetter jet has not been altered, and it is as delivered by the manufacturers. (3.) On starting, the machine misses violently for about 500 yards till it gets warmed up, and then runs perfectly regularly, and gives no trouble while running. I have, as I said, examined the carburetter thoroughly and covered all air leaks in inlet pipe, etc., with insulating tape. Both plugs spark properly.—B.P.

(1.) The trouble is possibly due to the needle valve of the carburetter requiring to be ground in or to grit on the seating. (2.) The blow back is probably caused by the inlet valve sticking in the guide, or through too weak a valve spring being fitted. (3.) This trouble also points to the strength of the valve spring being inefficient or to the valve sticking in the guide.

Mending a Cracked Piston.

I have bought a second-hand Douglas 2¾ h.p. motor cycle (1910) from a friend. It wants a lot of overhauling, and a couple of questions arise which I should like you to answer. (1.) The frame is designed for 1¾in. tyres. I have been recommended to use 2in. tyres. If I adopt 2in. tyres there would only be ⅛in. clearance each side of the tyres in the forks. Is this sufficient? If not, what do you consider is desirable clearance? (2.) There is a crack in one piston. I think I can repair it by drilling a small hole at end of crack and plugging it with copper to prevent further cracking. A small, thin strap would be riveted to the concave side of the piston. Do you approve of this patching, or recommend a new piston? —Douglas.

(1.) We are afraid there is not sufficient clearance for 2in. tyres, which is a great pity. About three-eighths to half an inch is the minimum clearance advisable. (2.) The suggested method of stopping the crack in the piston is a reasonable one, but it would be better to have a new piston. As a matter of fact, all you need do, if you care to risk using a damaged piston, is to drill a small hole at the end of the crack. We should not advise anything else.

Gear Changing.

I have just bought a 2 h.p. Junior O.K. motor cycle with an Albion two-speed bracket gear. When changing from low gear to high, after starting and getting about twenty yards, it began to jerk forward and then back, and I have to stop and start again; sometimes I have opened the throttle fully, and it has kept on jerking for several yards before the engine has got into an equal beat.—W.B.

The trouble is probably due to your engaging the high gear too early. Your best plan is to accelerate for a few seconds until a good speed has been attained, then raise the exhaust valve and engage the high gear, but not too quickly; if the engine jerks, retard the spark and close the air slightly. The "take up" should then be smooth. In changing down, wait till the speed of the machine has considerably decreased, then move the lever over without touching the exhaust, allowing the engine to accelerate.

Two-strokes.

Could you inform me if, with a two-stroke (seeing the greater number of explosions that occur), there is any greater heat created than from a four-stroke engine? Also, is there any greater consumption of petrol with two-stroke than four-stroke engines?—G.I.

Yes; a two-stroke is liable to get rather hotter than a four-stroke engine, and the two-stroke is rather more extravagant in petrol.

A daring riding feat by Corporal Taylor, who is attached to the West Riding Royal Engineers. The photograph is unfaked and taken whilst the machine was in motion.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"Miss M.B." (Cheshire).—Lady motor cyclists' advice as to the best style of skirt for use when riding standard machines, and from whom patterns are obtainable.

"W.C." (Balham).—7 h.p. Indian and 3½ h.p. model B Douglas. Reliability and petrol and oil consumption, solo and with sidecar.

"J.U." (Penketh).—A strong free engine hub suitable for sidecar work with 8 h.p. Matchless variably-geared machine, kick or hand starter.

J.A.P. ENGINES FOR 1915.

A NEW CYCLE CAR ENGINE.

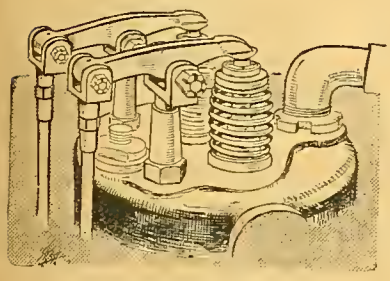


Fig. 1.—Improved valve gear on the new J.A.P.

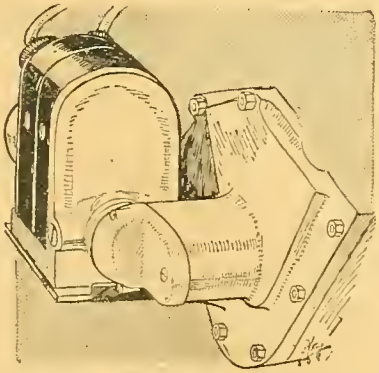

Fig. 2.—The enc'osed magneto drive.

IMPROVED LUBRICATION.

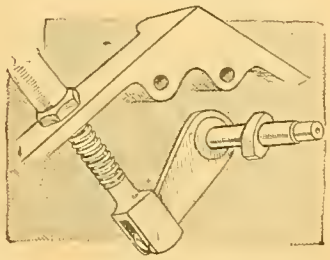

Fig. 3.—New design exhaust lifter on the J.A.P.

THE firm of Messrs. J. A. Prestwich and Co. was one of the first businesses to take up the manufacture of motor cycle engines in this country and to tackle seriously the foreign competition which was prevalent in the early days of the movement. Since that time the firm has gone ahead to a wonderful extent, and the large works recently taken over have been already considerably extended.

The latest production is an 8 h.p. cycle car engine of 1,082 c.c., the bore and stroke of which respectively are 90 mm. × 85 mm. It will be noticed on referring to the accompanying photograph that the crank case is an exceptionally large one. This allows large inside flywheels and does away with the necessity of a heavy clutch flywheel, and this, it is claimed, results in a much better balance. Moreover, the large crank case allows of very much bigger bearings, which have been increased in area 100%.

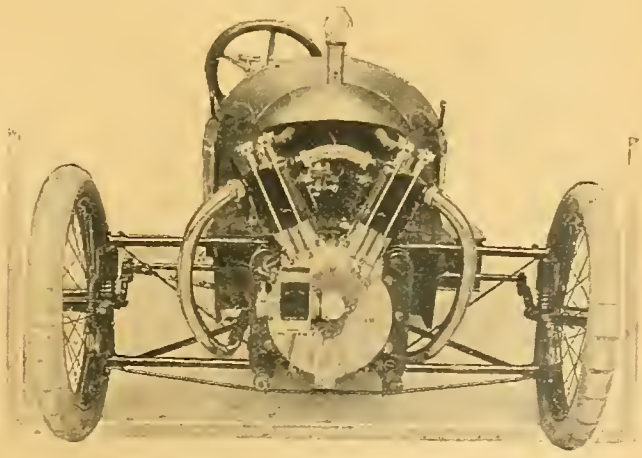
Other improvements are shown in detail: fig. 2 is the carefully enclosed magneto drive, and the interior mechanism of the exhaust valve lifter is shown in fig. 3. Instead of the rack and pinion system employed on last year's models there is now a spindle on which there is a double-face cam, a crank being connected directly to the spindle to which the Bowden wire is attached. The double-face cam works between the two tappet rockers, and is simple and well designed.

Considerable interest is to be attached to the valves, the design of which has been carefully studied. In the valves themselves particular attention has been paid to the question of heating, and they are designed so that the heat is conducted away from the mushroom on to the stem as soon as possible, and, as will be seen in fig. 1, the amount of stem exposed to the air is considerable. A great improvement has been made in the manner in which the spring cup is attached to the stem, and no cotter is utilised. The forks supporting the overhead rockers are screwed into the cylinder head, and are further secured by means of long nuts clearly shown in the illustration. These act as lock nuts and also as supports to the fork stems. The valve ports are all streamline in shape, and the general design of the engine has been given the special attention of Mr. E. B. Ware, an expert motor cyclist whose scientific abilities are not so well known as they deserve to be, and whose aim has been to bring out an engine in which the principal features are smooth, steady running and flexibility.

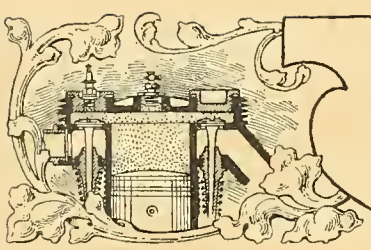
The excellent J.A.P. system of lubrication has been improved. This system, we may reiterate, consists of utilising the crank case compression and destroying the crank case suction by means of a valve. By its means quite a powerful jet of oil is forced through the valve, and the lubricant first issues through the main bearing, part of it passing through a hole in the bearing and part going behind the bush, issuing from a nick between the aluminium and bronze and being carried round to the crank pin and thence to the big end, while another portion of it goes through a pipe to the front cylinder, and yet another pipe conveys the oil to the plain bearing on the "pulley" side of the crank case. This idea of lubricating the front cylinder will be incorporated in all J.A.P. models next year.

The engine, it will be noticed from the accompanying photograph, is fitted to a Morgan chassis which Mr. Ware has got out for his own use on the track. It has been considerably improved in design; for example, the oil and petrol pipes, instead of passing outside the bonnet, come straight under the chassis directly to the carburetter and crank case. The bonnet side has been filled in.

The J.A.P. Works for 1915 will produce the following engines: the 2½ h.p. and 4 h.p. single and the 4 h.p., 5 h.p., and 6 h.p. twins, and the cycle car engine just described.



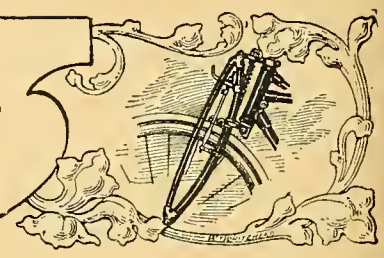
A new J.A.P. water-cooled engine of 1,082 c.c. fitted to a Morgan.



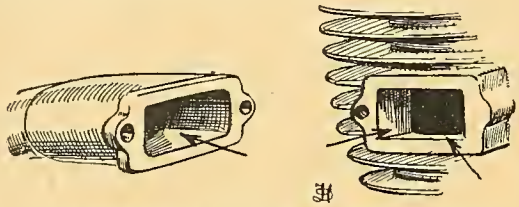
Hints for Beginners.

FIFTH INSTALMENT.

Some Notes on Two-strokes.



ON account of the very few moving parts in a two-stroke engine it becomes one of the simplest forms of explosion motor; especially is this the case when one considers the little single cylinder air-cooled engines which have become so popular of recent days. These engines have the minimum number of moving parts, and many are inclined to forgive them their minor faults on account of their simplicity and smooth torque.



A two-stroke exhaust port showing parts liable to become coated with carbon.

By the novice, however, or even by those accustomed to tuning up four-strokes, there is much to be learned, and many little tips which will prove useful to such as have experienced loss of power and failed to diagnose the cause of the trouble. The three-port two-stroke is so simple that at first sight it would appear that there is nothing whatever to be done but keep the jet clear and the magneto points adjusted, and to give the cylinder head an occasional clean out; yet perhaps these points are less likely to cause trouble than several that are far less obvious.

Crank Case Compression.

First of all, it must be remembered that crank case compression plays an important part in the functioning of nearly all present-day two-strokes. Therefore leakage must be carefully avoided, and there are many points to watch. A bad joint between cylinder and crank case, between the two halves of the crank case, a slack crankshaft bearing or a sticky piston ring, are all sufficient to make an appreciable difference to the power produced by the engine.

Probably the last-mentioned fault is the most common, and in certain extreme instances the writer has known of rings gumming up regularly in 300 or 400 miles. This, of course, causes loss of compression both in the crank case and cylinder, and the top ring is almost invariably the sinner.

When the engine loses power it should be stripped and attended to as follows. (The veriest novice need not be afraid of the job, provided care is used in every operation.)

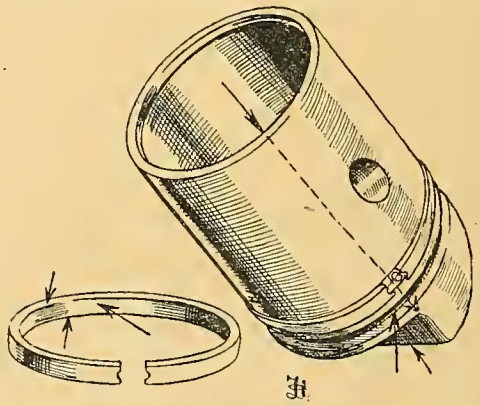
How to Proceed.

First of all, remove the carburetter (and inlet pipe if one is fitted), exhaust pipe, sparking plug, and compression release valve. The release valve should be carefully cleaned and the spring tested. If the spring is too weak to hold the valve firmly on its seat it should be replaced, or, as a temporary expedient, stretched. The cylinder may then be removed after taking off the holding-down nuts. The cylinder head must now be carefully scraped and all carbon deposit removed; a long copper tube of about half-inch diameter will be found very useful for this purpose, and if the cylinder head is tapped with one end, most of the deposit will be loosened. An old wood chisel is also an excellent tool for scraping purposes. When the head is clean, clear out the exhaust port. This often becomes very congested with cakes of hard carbon, every trace of which should be removed and the edges of the port carefully smoothed off.

Next remove the piston by taking out the gudgeon pin. In small engines the pin is usually slightly tapered and driven in, in which case the small end should be tapped with hammer and punch till it is driven out. This operation requires care, as the piston is very fragile. If any additional fixing is employed this must, of course, be removed first.

Next remove the piston rings with a piece (or three pieces) of stiff wire or a fine knitting needle; great care is again required or the rings will be fractured.

The piston head should now be scraped free of carbon and polished with fine emery cloth. The under side of the head is important, as in most two-strokes more deposit will form here than in any other spot. Now carefully scrape the ring grooves and sides and back of the rings with an old knife blade or any other suitable tool. The carbon behind the



A two-stroke piston and ring. The arrows show places which require careful cleaning

rings and in the bottom of the grooves is often hard and smooth so as to take on the appearance of cast iron, but do not be deceived, a few taps with the point of a knife will soon show if any carbon is left and also the depth of it.

Hints for Beginners.—

In replacing the parts a little good oil should be wiped over the gudgeon pin and piston and all joints should be carefully cleaned and lightly smeared with seccotine or gold size. The inlet port joint and the cylinder base are particularly important in this respect. Before replacing the parts, thoroughly wash out the crank case with paraffin till it is quite clean, then test the crankshaft bearings for play. The best way to check this is to try and raise each end of the crankshaft separately. If there is much lift the engine requires new bushes, and this is not a job for the amateur, so it should be returned to the makers or to a competent engineer. If, however, all is well, pour a small amount of oil (about a pumpful) into the crank case, taking care to fill each of the bearing leads. Then the engine may be put together as before, each part being carefully cleaned and oiled before re-assembling. The magneto timing of a single-cylinder two-stroke is particularly simple, but as it has a great effect on the running of the engine it should be carefully carried out.

Remove the chain sprocket from the magneto, leaving it loose on the spindle, then turn the engine till the piston is at its highest possible position. Now place the spark lever in the full retard position and turn the magneto spindle till the platinum points of the contact breaker are just breaking. If necessary get someone to hold the magneto in this position while the sprocket is refixed. A tap on the sprocket will usually hold it in position till the nut is tightened. Then check the timing and make quite sure that the points break when the piston is dead on top and the spark lever fully retarded.

Some Useful Work for Motor Cyclists.

How a Motor Cyclist Corps could be Utilised for Tracing Wounded and Missing Men and Rendering Valuable Assistance.

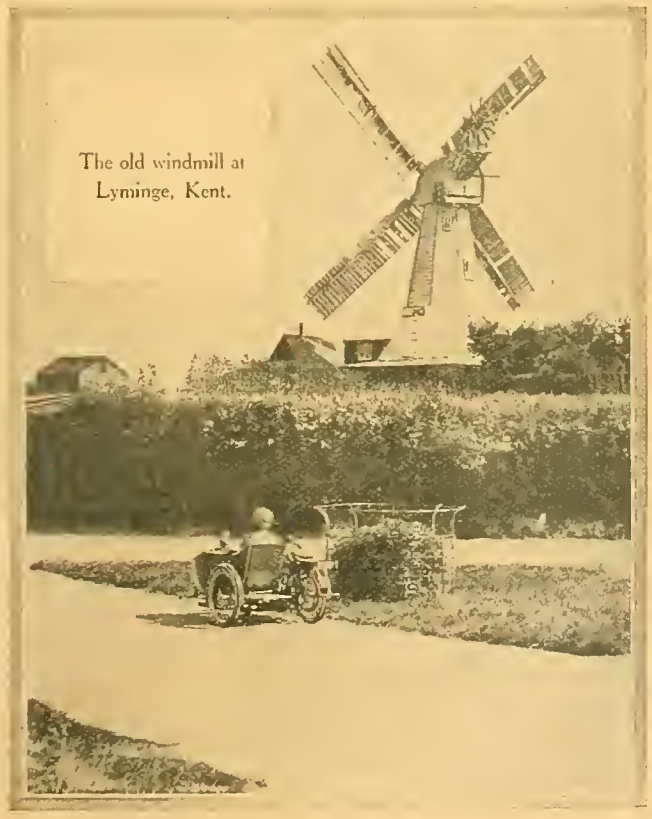
AMONG the various spheres of utility of motor cyclists in connection with the war, one that has not as yet, so far as we are aware, been taken advantage of is the possibility of using motor cyclists in connection with the important work of tracing missing men. Our suggestion is that those organisations which may be responsible for this work might well employ a considerable company of motor cyclists having their headquarters at some convenient point in France, and scouring systematically the whole of those portions of the country where fighting has taken place.

The object of this is two-fold. In the first place, the scheme would lead to the discovery of wounded men being treated kindly but possibly inefficiently at houses and cottages dotted about the countryside. On making such a discovery, the motor cyclist would communicate immediately with his headquarters, with a view to a motor ambulance being sent out to the point indicated and the wounded man carried comfortably to the nearest equipped hospital.

Then, again, there must be very many instances in which the relatives of men posted as missing are being kept in a state of anxiety, which is perhaps even worse than the certainty of loss. Probably quite a considerable number of men who have been killed in action have subsequently been given burial by civilians without any record having been kept or made available at the War Department which would allow of any identification. In some such cases, the precaution may have been taken of preserving the identification plate affixed to each man's uniform, and in others some other information may have been gleaned which would assist in the same direction.

To do useful work in this connection would, of course, imply a good knowledge of the French language, since enquiries would have to be made at all sorts of out-of-the-way places where English would probably not be understood. We suggest, therefore, that those responsible for carrying on the work of the kind we have outlined above would do well to form a corps of motor cyclist volunteers willing to maintain themselves and their machines, and to undertake to make minute investigations over areas assigned to them, and to report to headquarters periodically.

One point more: many a stranded English soldier, despite the well-known resourcefulness of Tommy Atkins, must have great difficulty in finding his way about an unknown country owing to his lack of local geographical knowledge and his inability to speak the language of the countryside. To such a man a motor cyclist who possessed the required information would be a godsend, since he could put the soldier on the right road as well as carry news of him to the authorities, and through them to his friends and relations.



The old windmill at Lyminge, Kent.

DESPATCH RIDERS IN FRANCE.

A Brief Summary of the Daily Life, Routine, and Duties as Experienced by One of their Number.

FOR the benefit of the readers of *The Motor Cycle*, who are, no doubt, more or less interested in the movements of the despatch riders actively engaged with the British Expeditionary Force, I think perhaps some further description of the duties imposed upon this merry little band would be interesting at the present time, especially now that a special commendation from the General Staff has been given us for the good work that is being daily carried out in this direction.

In the first place when landing in France parties of usually half a dozen riders are given positions with various sections of the Army. For instance, the 1st, 2nd, and 3rd, etc., divisions have so many men permanently (that is, "unforeseen circumstances permitting") allotted to them. The Cavalry Division and the various Cavalry Brigades each have their contingent. Usually the riders form part of the staff of a field signal station, which consists of wireless and heliograph installations, etc., and in turn form part of the equipment of each division. The duties of despatch riders consist mainly of forming lines of communication where wireless and other apparatus are not permissible. I think it can be safely said that, except under very special circumstances, motor cyclists are not used for scouting purposes, the noise of the exhaust of the engine obviously being a great drawback, but I can assure readers that the average rider will find enough excitement and thrilling episodes to satisfy his appetite in the daily duties of a despatch rider in France.

A Continuous Reliability Trial.

Regarding the actual riding, I think the best way to express my opinion would be to call it "a continuous reliability trial of the A.C.U. brand," with the exception that trial machines in England receive, naturally, every attention, and are studied and tested and examined in every detail, whereas the machines "out there" receive every neglect. I can assure my readers that care of our machines is a thing that cannot claim our attention in times of warfare. When a military motor cyclist has ridden continuously for, say, twenty-four hours in drenching rain and over "hellish" roads it is not unnatural that all thoughts he may then have in his head are centred upon "number one," and the machine can go to —— to graze. Small wonder is it, then, that the machines with the soundest construction and fewest working parts are the ultimate survivors. If asked my opinion on the ideal machine for warfare I should immediately say, "The simplest and strongest," and I think full credit can be given to the War Office on their choice. Despatch riders must have the best of everything. I have seen practically new machines abandoned through faulty plugs, stretched wires, punctures, and such minor troubles. You ask why? Well, imagine the enemy about a mile away, hot after you, and then ask yourself what you would do under the circumstances.

Coming to the rider; while I have never yet known a man regret the step he took in volunteering, a despatch rider's life is not by any means a bed of roses. Great hardships are experienced, which, of course, are undergone by every soldier, but the great thing is to "keep your pecker up."

Do not let it be thought that speed merchants make the best despatch riders. If anything, they are the worst. A cool head, keen eyes and ears, initiative, and discretion, play a far more important part in the execution of duties than the fact of the speedometer needle maintaining the "forty-five" mark. Remember, a despatch rider differs from the ordinary "Tommy" in the respect that when working he is his own master and has two valuable things to look after—a despatch and his own life—and "blinding" is not a precautionary measure for either. No, the careful plodder always wins.

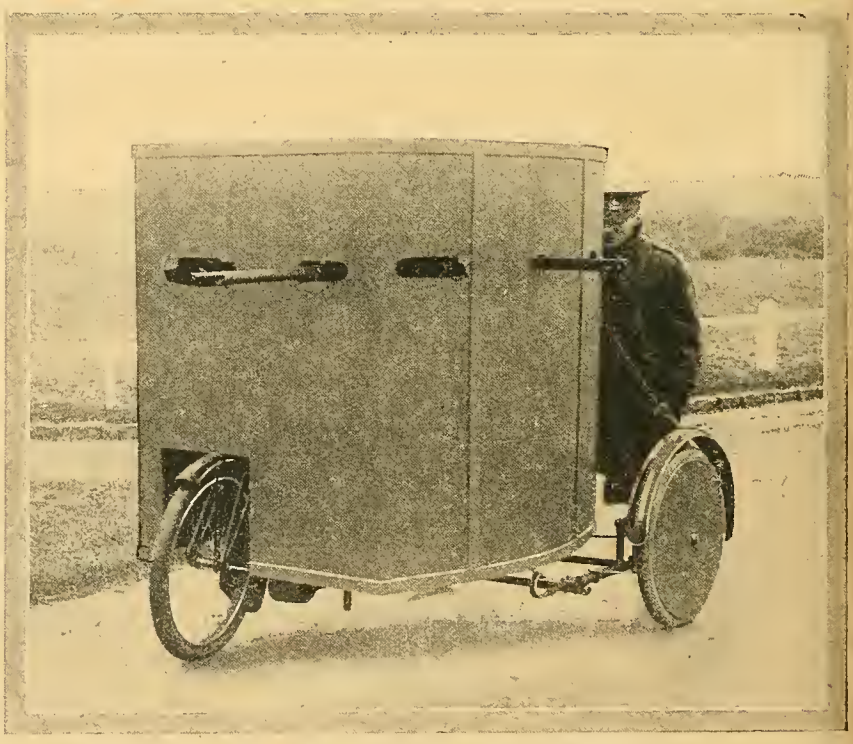
The four items that claimed my principal attention when in France were food, sleep, oil, and petrol, and at times I found it advisable to pay a little more attention to the procuring of the latter two than the former two. On active service the maxim is "get it when the opportunity affords or go without," and the opportunities for securing fuel for the "'bus" were certainly not so frequent as those afforded by the commissariat.

The Difficulty of Hearing Challenges.

I think it is universally agreed that the most unpleasant part of a despatch rider's duties is the night riding, and, unfortunately, there is plenty of it. It is not so much the dangers of your work that worry you. They are apparent both night and day, and become second nature to you, but it is the awful solemnity of the whole thing, the gruesome sights of the day's "business" that you witness, the tension on your mind, which is doubled sometimes by the fact that you have not the faintest idea where you are going and the rude awakenings that you invariably receive from the outpost sentries, who, having their challenge unheeded—which you never hear owing to the noise of the exhaust—simply come out from cover and either stick their bayonet in the way of your progress or level a rifle at your head. But the great point is that you do not know whether the sentry is a German, a Frenchman, or one of your own countrymen until you stop.

But, taking things all round, a despatch rider's time is no worse, and much better than some others' experiences, and there is a great deal of satisfaction to be derived from the fact that you are doing your little bit for your country in the execution of your favourite hobby. For myself, I anticipate being back again in a month.

F. A. ENDERS.



THE ARMOURED SIDECAR HAS ARRIVED!

The above armoured sidecar has been produced by the Golby Sidecar Co., of Coventry. It is the first specimen and made of wood, but it is considered that a design on similar lines with metal body and propelled by a powerful twin-cylinder engine would be able to perform useful work in the war zone.

The Junior Triumph

2¼ h.p. 2-stroke 2-speed Lightweight Motor Cycle is just the mount for the business man residing some distance from town.

It will serve as a connecting link between home and office—convenient, speedy, and safe—and leave the rider quite independent of time table travel.

The Junior Triumph is so easily controlled that it can be ridden in dense traffic with every confidence even by the novice.

It will crawl at 3 m.p.h. and accelerate to 35 m.p.h., mount any hill, and it is particularly immune from skidding on wet and greasy roads.

Being so light—only 125 lb.—it is handled almost as easily as a pedal cycle.

May we send you Catalogue of this, our latest production, post free ?

CLUB NEWS.

Wolverhampton Motor Cycle Auxiliary Defence Force.

The first general meeting was held on the 15th inst., at the Imperial Commercial Temperance Hotel, Wolverhampton, when thirty-six members were enrolled. Arrangements were made for rifle and pistol practice. The hon. sec. is Mr. F. Gould.

Cyclecar Club.

A rally will be held at the Red Lion Hotel, Hatfield, at 2 p.m. on November 21st, followed by a procession through London to Burford Bridge and a rally at Wisley Hut Hotel on the following day.

Waterford and District M.C.C

The reliability trial for the Rudge Cup was re-run on the 8th inst. over a course of fifty-eight miles, starting from the City Hall, Waterford, and running through Mooncoin, Piltown, Carrick, Portlaw, Kilmeaden, Sweep, Waterford, Calloghone, Dunmore, and back to Waterford. Result :

1. J. C. Ruttledge (3½ Rudge sc.) ... 100 marks
2. J. Kirwan (3½ Rudge) ... ... 98½ ,,
3. T. H. Whitney (5-6 Rudge sc.) ... 96½ ,,

The last-named, having tied in the previous trial with W. Brabazon on a similar machine, proved to be the winner. There were thirteen competitors, ten of whom were mounted on Rudges.

(1) (Left) C. Holmes (winner) and (right) A. T. Lee (second and made fastest time) in the Tasmanian A.C open hill-climb. Both rode Rudges

(2) Winners of the Five Mile Open Handicap at Perkolilli, Western Australia. Left to right : (1st) C. A. Savage (3½ h.p. Triumph), (2nd) J. Hekir (Singer), and (3rd) W. Long (2¾ h.p. Douglas).

Motor Cycling Club.

The closing run will take place on the 25th inst., the *venue* being the Chequers Hotel, Horley.

Wolverhampton M.C.C.

A paper was read last week to the members by Mr. Harry Stevens, entitled "How we won the T.T." Mr. Stevens dwelt upon the troubles and difficulties which had to be overcome, and related many amusing experiences. A short discussion then took place, followed by a vote of thanks.

Mersey M.C.C. Map Reading Test.

The re-run of the Mersey (Liverpool) Motor Club's map-reading contest took place recently, starting from Queensferry at 2 p.m. Each of the thirty-five competitors was armed with a Bartholomew No. 12 Cheshire map with the course marked in black instead of the hand-drawn sketches supplied for the original trial. The keenest rivalry was shown, as most of the riders were on the waiting list of Army despatch riders. The course was only forty miles, but covered some very hilly country, and was most suitable for such an event. The first obstacle was a very severe hill at Ifrith, with a watersplash at the foot. Here Matthews (7 Indian) came to a standstill with clutch slip. On Cilcain a large number came to grief, but Jones (Singer cycle car), Azancourt (Rover), and Brown (Indian) made very fine ascents. The main trouble was averaging 20 m.p.h., a large number failing from this cause. Only five turned up at the finish, and of these two were disqualified for leaving the course. The results were as follow :

Best performance of the day, N. Brown (7 Indian)
First solo, G. Azancourt (3½ Rover)
Second solo, V. Horsman (3½ Singer).
First sidecar, N. Brown (7 Indian)

Coventry and Warwickshire M.C.

Fifteen took part in the handicap shooting contest at the Shottery Range, near Stratford-on-Avon, last Saturday afternoon. The proceeds were to be handed over to the Prince of Wales's Relief Fund. The result of the match over a twenty-five yards range was : (1) J. W. Roebuck ; (2) H. Whiteman ; and (3) S. Wright.

A CLUB ROLL OF HONOUR.

The following officials of the Westmorland M.C.C. have joined His Majesty's Forces, besides a number of ordinary members :

J. M. Somervell ..	Public Schools Batt. ..	Private.
T. Inglis Hall	9th Hussars	Trooper.
L. S. Hoggarth ..	4th Border Reg.	Lieutenant (gun team).
G. T. Hogg	10th Border Reg.	Sergeant.
A. J. Moffat	Yeomanry	Trooper.
J. Wright	St. John Ambulance ..	Superintendent.
B. Jefferys	9th Border Reg.	Private.
A. Somervell	Public Schools Batt. ..	Private.
W. Westwood	Royal Engineers	Corporal (despatch rider).
E. Jefferys	9th Border Reg.	Private.

MOTOR CYCLE RACING AT THE ANTIPODES.

Toward the end of August some motor cycle speed trials were held by the Kalgoorlie M.C. on the surface of a dry lake called Perkolilli, which is absolutely flat and very hard. The result of the Five Mile Open Handicap was as follows : 1, C. A. Savage (3½ Triumph) ; 2, J. Helin (3½ Singer) ; 3, W. Long (2¾ Douglas). Time 5m. 14s. A rather novel race was a contest from a standing start for one hundred yards between E. Grey on a pedal cycle and the motor cyclists. Savage was the only man who could beat Grey over this short distance.

The Tasmanian A.C. annual hill-climb resulted in a victory for Rudge machines. C. Holmes (3½ Rudge-Multi) was first, while A. T. Lee (3½ Rudge) was second and made fastest time. Speed about fifty miles per hour.

Our Shilling Fund for Despatch Riders

Readers! Show your appreciation of the loyalty of despatch riders at the front by sending a shilling towards *The Motor Cycle* Fund to provide useful Christmas presents.

Practice in Rifle Shooting

Practice in rifle shooting has been taken up most enthusiastically by members of the Coventry and Warwickshire Motor Club. A handicap is arranged every Wednesday evening at the Humber range, and members are becoming really proficient in the handing of a rifle. Scores of 95 out of a possible 100 on a match target at twenty-five and fifty yards range are becoming common

Helping the Wounded.

We understand that a large number of sidecar drivers in Kent in the Greenwich and Shooter's Hill districts are taking out the convalescent wounded for runs, with the greatest benefit to the health of the sufferers.

British and American Motor Cycle Exports.

America's exports of motor cycles during July numbered 501. As a comparison, Great Britain's total for the same month was 2,151—over four times the number.

Motor Cycle Constables.

T. J. Ross, a Triumph competition rider, is serving with the special motor cycling constable force at the head station, Rochester Row, S.W., and refers to the work as being interesting and the motor cycles invaluable. Each rider is provided with a belt and heavy truncheon, and is, for the most part, engaged in night and early morning work within a radius of ten miles

SPECIAL FEATURES

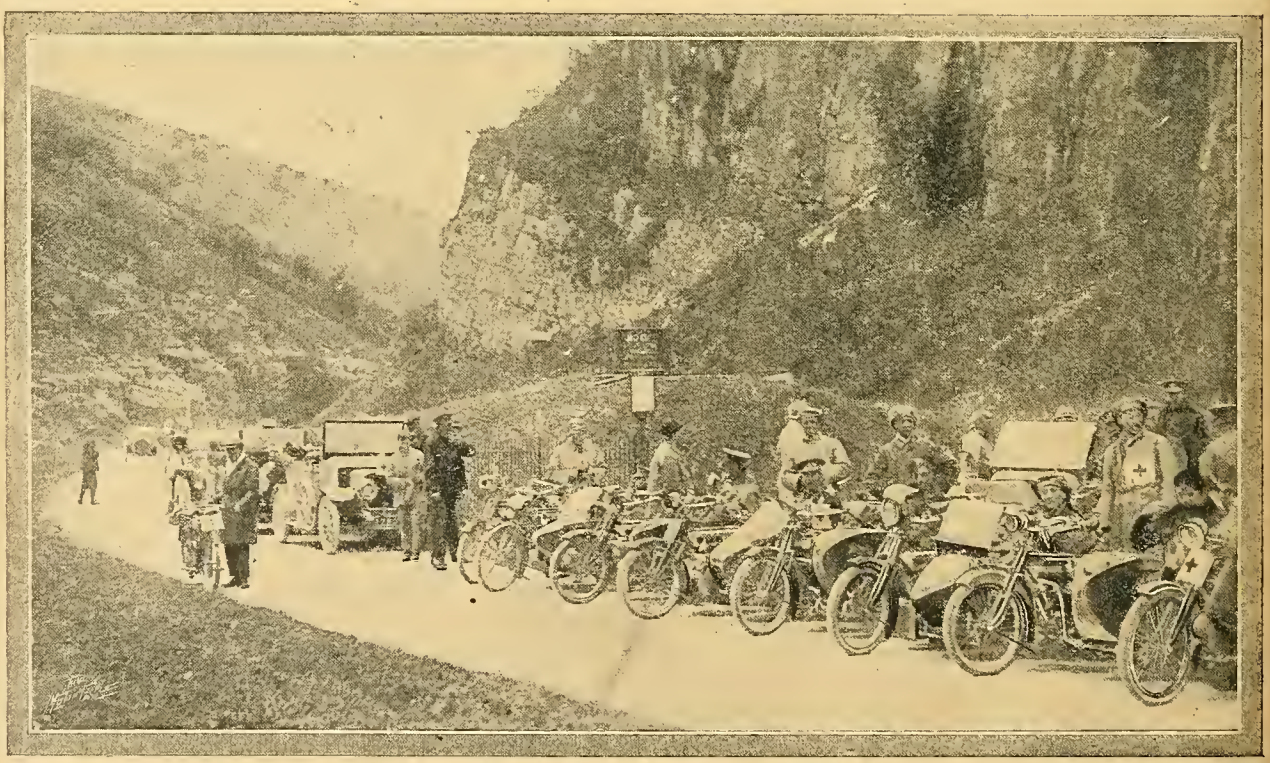
HINTS FOR TWO-STROKE USERS
REVS: A SERMON FOR SPEEDMEN.
XMAS GIFTS FOR DESPATCH RIDERS.

British Motor Cycles Favoured.

American manufactnrers were hot on the scent of the Russian Government order for motor cycles, an enquiry for 900 machines being circulated in the States. We are given to understand, however, that the whole order for over 2,000 motor cycles was finally placed in this country.

More Motor Cyclists for the Front.

Two well-known members of the Woolwich Club, E. Ilsley, a brother-in-law of C. R. Collier, and who has been his sidecar passenger in several recent trials, and W. Howard, have joined the Woolwich detachment of the mechanical transport section A.S.C. Both have been supplied with new Triumph three-speeders.



SIDECAR SAMARITANS IN CHEDDAR GORGE.

Members of the Bristol Motor Cycle Club last week took a party of seventy wounded soldiers from the Bristol Royal Infirmary (Red Cross Hospital) into Cheddar Gorge. The trip proved thoroughly enjoyable.

Our Annual Buyers' Guide.

The annual Buyers' Guide of *The Motor Cycle*—a feature introduced in *The Motor Cycle* of 1906—will appear on November 19th. Its value will be considerably enhanced this year by reason of the decision not to hold a Show.

A New Name Adopted

The Coventry Premier, Ltd., is the new name decided upon at a recent extraordinary meeting of the Premier Cycle Co, Ltd.

A Too Zealous Official.

An officious policeman the other day stopped a special constable motor cyclist, though he was wearing his badge of office, and accused him of exceeding the speed limit in one of the Royal parks.

The Russian Army Representative.

There has been some difficulty in getting the correct name of the sporting Russian officer who has been testing motor cycles on behalf of his Government. His correct name is Captain Vladimir Avelevitch Mgebrov.

A New Cycle Car.

A new cycle car is being introduced by the A.S.L. Manufacturing Co., Ltd., which is to be named the Stafford. The machine will be on true cycle car lines, and will have a twin-cylinder engine of 1,090 c.c. capacity, and a chassis weight of 7 cwt. A machine of this type has been under test by the firm for some time past.

Profits in the Motor Cycle World.

The balance sheets of the different companies interested in the manufacture of motor cycles are now being made public, and practically all of them so far reveal good business and profit.

The most striking of all perhaps is the Rover Co.'s profit and loss account, which shows an available balance of £189,991. A dividend of 40% (the same as last year) is recommended on the ordinary shares, and besides carrying a large amount to reserve, the directors propose to distribute £15,000 bonus among the workpeople and staff, and have further devoted £5,000 to the dependants of workpeople who have gone to the Front.

The Birmingham Small Arms Co., Ltd., balance sheet showed a profit of £190,429 9s. 4d., and the Enfield Cycle Co., Ltd., a profit of £43,614 2s. 7d.

Military Motor Cyclist Fined.

At the Scarborough Police Court on Wednesday, the 14th inst., the magistrates considered it necessary to fine a military motor cyclist for doing his duty. The pretext was that he was driving to the danger of the public. Although the man was riding a Government machine and his captain gave evidence that he was obeying orders, he was fined ten shillings and costs, or more than a week's pay. He was held to be liable under Civil Law, although on active service. Does this mean that a despatch rider carrying urgent messages, which affect the welfare of the nation, may be summoned for exceeding the twenty miles per hour? In view of the present crisis the decision is most astonishing, and though we do not wish to encourage law breaking, we believe that a soldier on active service can only be imprisoned by civil authorities for crime or a debt of over £30. What if the defendant had refused to pay?

Three-speed Indians for 1915.

The 1915 model Indians promise to create some interest when they arrive over here. It will be remembered that we hinted a month or so ago that a 5 h.p. twin on the lines of the T.T. model would form one of the new range, and we are now able to announce that the three new designs for 1915 are 3½ h.p., 5 h.p., and 7 h.p. twin-cylinder mounts, all with three-speed counter-shaft gears.

A Resignation.

Mr. Alec Rotherham has resigned his position as managing director of the Premier Cycle Co., Ltd., Coventry, as from the 31st of this month. Mr. Rotherham's connection with the company has been a long and honourable one, and we regret that he should feel that the time has now come when he should take a rest. At the same time, the traditions of the company will be maintained, as not the least of Mr. Rotherham's achievements was the gathering round him of a most able staff.

The Large Russian Government Order.

In addition to the 1,662 motor cycles, referred to in our last week's issue, which have been ordered from Coventry firms alone for the Russian Army, we are advised that the James Cycle Co., Ltd., have practically completed an order for 260 machines spread over their 4¼ h.p. big single and 3½ h.p. twin models. Two hundred and sixty machines represented the most the James Co. could turn out in the limited time stipulated.

Messrs. Phelon and Moore, too, completed last week their batch of 100 machines, which was exactly half the number of the original order. Owing to the imperative demands of the British War Office, Messrs. Phelon and Moore were obliged to curtail the number of machines called for by the Russian Army. Incidentally, seventy more P. and M machines have just been supplied to the Royal Flying Corps, of which corps P. and M.'s, equipped with Kempshall tyres and Lucas lamps, form part of the standard equipment.

Messrs. Chater-Lea, Ltd., booked an order for their 8 h.p. No. 7 sidecar combination with the Russian War Office which covered all their stock and three weeks' production of the factory. This order was placed only after an extraordinarily severe test.

The two-stroke Clyno, of which a large number were ordered, is the only two-stroke type of machine selected by the Russian Government.

A New 6 h.p. Twin.

A.S.L. motor cycles will in future be known as the Stafford. A new model for 1915 will have a 6 h.p. J.A.P. engine with side valves, a counter-shaft three-speed gear box, and a new design spring fork. Mudguarding is to be a feature of this mount.

An Old Machine under a New Name.

The Metro two-stroke lightweight, several illustrations and drawings of which appeared in our issue of June 25th page 843, has been re-named the Gaby.

Main Contents of this Issue.

Continuing our first descriptions of new models, we illustrate and describe in this issue

A NEW J.A.P. OVERHEAD VALVE CYCLE CAR ENGINE.

THREE 1915 MODEL CALTHORPE LIGHTWEIGHTS, including a new two-stroke and two four-stroke machines.

THE NEW PRECISION JUNIOR ENGINE with vertical valves.

NEW ACCESSORIES BY BENTON AND STONE.

LUCAS DYNAMO LIGHTING SET FOR SIDECARS, which has already been illustrated in *The Motor Cycle*, but of which we are now enabled to publish a technical description and a wiring diagram.

WELL-KNOWN MOTOR CYCLISTS OFF TO THE FRONT AS DESPATCH RIDERS.

Left to right: F. C. North, H. R. Davies, and Albert Milner. All are mounted on three-speed Triumphs. The photograph was taken last week a few minutes before they departed for the front.

MILITARY NOTES.

TEE-TEEING AT THE FRONT.

Sydney A. Rowlandson, the manager of the competition department of the Rudge Co., now in North-east France with the Mechanical Transport Section of the Expeditionary Force, writes as follows: "Have not forgotten Coventry. 69 Company is very Coventry. Our lorry is a Daimler, crew made up so: The Haddons, of Leamington; R. Sykes, who previous to coming out was a Maudslay 'bus driver in Coventry; and S. A. Rowlandson. We have to do all sorts of jobs. They won't let us say where we are or what we are doing. Times not at all bad; up early, at it late, on guard at night sometimes, and all such warlike procedures. Met a Rudge despatch rider, who spoke splendidly of the machine; said he had just beaten a rider of a well-known make in a scrap and won five francs. One thing we are thankful for is, we are having glorious weather."

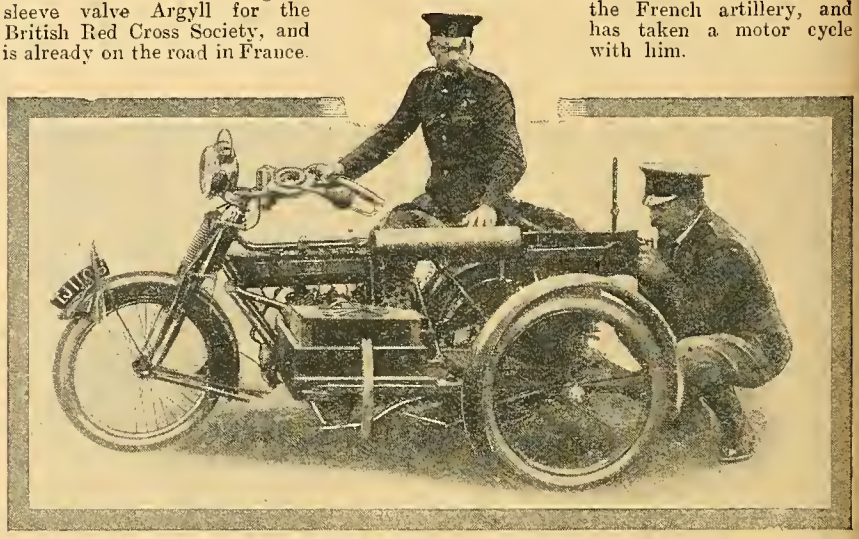
T.T. RIDERS AT THE FRONT.

Eric and Cyril Williams have gone on active service. It may be remembered that Eric Williams won the Junior T.T., and Cyril Williams ran second in the same event. The pair are not related in any way. These well-known riders are mounted on machines of the same make (A.J.S.) as those on which they distinguished themselves in the Junior T.T. Race, and are wearing the armlets which distinguish them as being attached to a signal section. Both riders left for France last week.

B. Alan Hill is driving a 15-30 h.p. sleeve valve Argyll for the British Red Cross Society, and is already on the road in France.

With characteristic enterprise the Rudge Co. has had its instruction booklet, "Rudge Wrinkles," printed in Russian, and a copy will be supplied with each Rudge-multi.

M. Picaud, who is the Clyno and Bradbury agent in Paris, is serving with the French artillery, and has taken a motor cycle with him.



THE SIDECAR IN WARFARE.

A quick-firing gun mounted on the chassis of a 6 h.p. Enfield sidecar combination. It is in use by the South African Defence Force. Incidentally we marvel why large numbers of fleet and mobile sidecars are not fitted up in this way.

MENTIONED IN DESPATCHES.

MR. G. VALENTINE WILLIAMS, writing in *The Daily Mail* early this week, speaks very highly of motor cyclists and their work. Of the motor cyclist corps he says: "Every General Staff officer to whom I have spoken is enthusiastic about the work it is doing, and, as a corps, it certainly has not its equal in any of the armies in the field. All classes are represented among the Army motor cyclists. Most of them are undergraduates or public school boys, many have come from the Officers' Training Corps, many are clerks or shop assistants. All the varied accents of class and county are heard in their speech, from the correctness of Oxford to the homely burr of the West. But the most complete democracy exists among these knights of the road. Cliques and classes seem to have vanished when the blue and white arm-band of the Signalling Corps of the Royal Engineers—the emblem of their branch—was fastened to their sleeve. The life is none too easy," he goes on to say. "The motor cyclist has to shift for himself; he moves too fast and too often to be provided for by the machinery the Army arranges for finding quarters. After presenting his despatch he sets out to find (a) somewhere to wash; (b) something to eat; (c) somewhere to sleep; and (d) where the petrol is kept." In conclusion, Mr. Williams says: "Among them one begins to understand something of the moral ascendancy which, according to the official despatches, 'French's contemptible little army' has succeeded in establishing over the German troops. Yet these boys have not been soldiering long enough to absorb the traditions of the Army. One would like to think that theirs is the spirit of us all."

How the riders are distinguishing themselves in the field may be seen by glancing through the first list of those mentioned in despatches which appeared in the daily papers in the early part of the week. Our attention is naturally first directed to the Royal Engineers. Here we find the names, among the officers, of Major M. G. E. Bowman-Manifold, D.S.O., and Major A. B. R. Hildebrand, who have taken a keen interest in the despatch riders for a period dating from some time before the war; Corporal C. W. Cadman, Corporal D. Humphries, and Lieut. A. Q. Roberts. A. Q. Roberts is the brother of the well-known rider, C. Q. Roberts, who before the war was working with Messrs. Burney and Blackburne. Before leaving for the Front, A. Q. Roberts was being coached for Cambridge. Other despatch riders mentioned are Corporal T. P. Norris and Hugh Trepess. Although there appear to be comparatively few names in the list of motor cyclists mentioned in despatches, there will undoubtedly be more later on. We are also handicapped by the fact that many officers and men of the Royal Flying and Army Service Corps are mounted on motor cycles, and this fact is not mentioned in the official lists.

Eric Williams (A.J.S.), winner of this year's Junior Tourist Trophy Race, who left for the Front last week.

Among the promotions we note that:

Second Lieutenant Allen H. Selwyn has been promoted from the R.E. Special Reserve (Motor Cycle Section) to be a second lieutenant in the A.S.C. (Regulars).

A. Q. Roberts has been promoted to rank of lieutenant and C. Q. Roberts to that of sergeant.

Scarborough M.C. Autumn Trial.

The annual autumn reliability trial was held last week over the course: Scarborough, Pickering, Helmsley, Chop Gate, Ingleby, Greenhow, Castleton, Lealholm, Egton Bridge (lunch), Sleights, Pickering, Scarborough (approximately 120 miles). Hills were observed at Westhouse Bank, Danby End, Limber Hill, Grosmont, and Blue Bank. Fourteen competitors started out of an entry of twenty-two, and nine finished the course. Results:

		Marks lost.
	CLASS I.—Solo Machines.	
1.	H. E. Ellis (2¾ A.J.S.)	0
2.	W. Brown (6 Zenith)	2
	CLASS II.—Sidecars.	
1.	W. E. Grange (6 Bradbury)	0
2.	A. Proctor (4 Triumph)	4
3.	E. Sykes (5-6 A.J.S.)	12

W. E. Grange (6 h.p. Bradbury sidecar) and H. E. Ellis (2¾ h.p. A.J.S.) ready to start from Egton Bridge, the lunch stop.

J. Woodhouse (4 h.p. Triumph sidecar) taking the corner on Limber Bank, a hill which, in all previous contests, has proved a stumbling block.

A MOTOR CYCLE AND CYCLE CAR SHOW AT BRISTOL.

OWING to the Olympia Show not being held as usual, the Bristol M.C.C. have decided to hold an open eighteen-hour trial for motor bicycles (with or without sidecars) and cycle cars on Friday and Saturday, November 27th and 28th, starting at 9 p.m. and finishing at 3 p.m. At the same time, the club will endeavour to obtain the use of a large hall, so that all entrants can arrange to stage their machines a day or two before the trial for the public to see. One of the conditions, however, will be that each machine must be a competing machine in the trial. The machines will, after the trial, be restaged in the condition in which they finish.

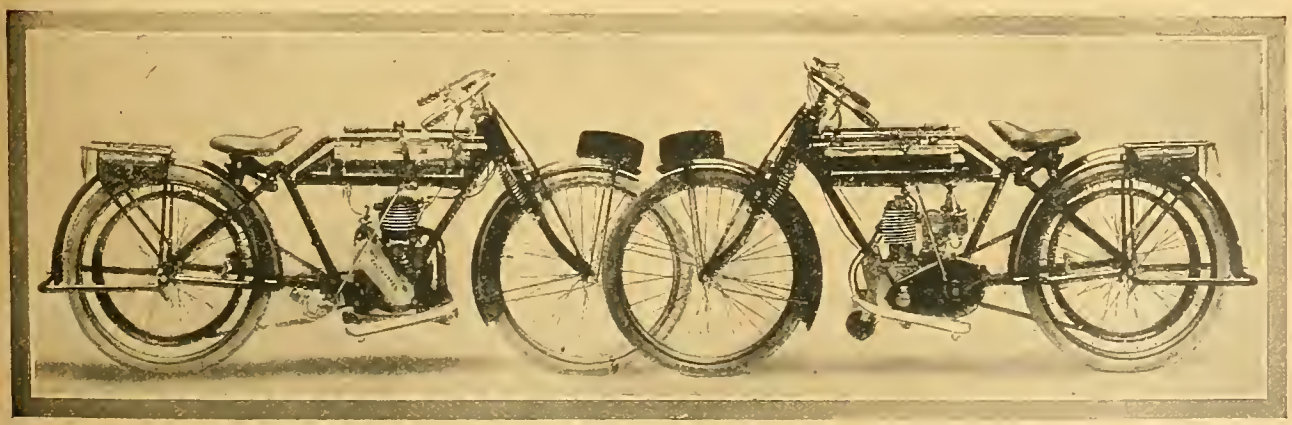
The trial will be in the nature of a 20 m.p.h. reliability trial; distance about 340 miles in hilly country.

The entry fees have been decided upon as £1 for all trade entrants and 5s. for non-trade. Entry forms and all particulars of the trial can be obtained from the secretary of the meeting, Mr. F. F. Cox, 12, Perry Road, Bristol.

Application has been made for a permit from the A.C.U. The surplus, after expenses have been paid, will be handed over to some war fund.

ESSEX MEN FOR THE FRONT.

Messrs. Ernest J. Bass and Ray Abbott, the hon. treasurer and captain respectively of the Essex Motor Club, have joined the Army Service Corps and expect to go to France during the current week. This makes thirty-two members of the club who have joined the forces, and out of a membership of about two hundred the Essex Club officials believe that this must be a record.



TWO 1915 MODEL CALTHORPE MACHINES. The new two-stroke. The 2½ h.p. J.A.P. engined mount. (See next page).

LATEST DESIGNS.

Advance Descriptions and Illustrations of 1915 Model Motor Cycles and Accessories.

THREE NEW CALTHORPE LIGHTWEIGHTS.

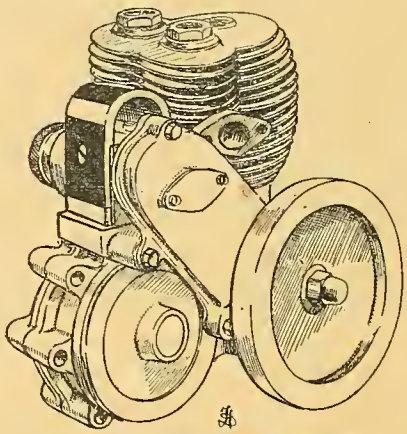
SEVERAL modifications have been made in the little Calthorpe Junior, but the most striking feature is the adoption of the latest type of Precision Junior engine. This engine has been slightly increased in capacity, and, though the main features of combined engine and gear box and cam and gear-shaft in one are still maintained, the cylinder and the valve action are altogether different. The more orthodox type of side-by-side valves, operated by vertical adjustable tappets, have replaced the horizontal valves placed in the head and opened by rocking beams. In spite of this, the fact that the valves lie behind the cylinder instead of at the side forms an interesting feature and renders the inlet and exhaust pipes simple, and in the case of the Calthorpe these are very neatly carried out. The outside flywheel is still retained and the magneto is placed behind the cylinder. Neat footboards are employed and the change-speed gear is still foot-operated as before. The mudguarding is efficient and the Calthorpe Co. has succeeded in turning out a practical businesslike little mount at a reasonable figure.

The stroke remains 60 mm. as before, but the bore has been increased to 65 mm., which brings the capacity up to 199 c.c.

We were glad to note the adoption of girder type Druid forks and 2in. studded tyres. These two points were the subject of criticism in *The Motor Cycle* some few weeks ago. The price remains at twenty-five guineas.

New Two-stroke Model.

An entirely new departure is the marketing of a two-stroke mount of 2½ h.p. complete with counter-shaft two-speed gear and chain-cum-belt drive. The specification includes Druid girder forks, XL'all pan saddle, a new tank, and sight feed lubrication.



The new Precision Junior engine set. The 1915 engine has vertical valves.

The lubricating oil on this machine is kept entirely separate from the petrol. The Calthorpe Co. are of the opinion that the "petroil" mixture will be discontinued generally, as from their tests it is found that much greater efficiency is shown by keeping the two constituents apart. The two-stroke Calthorpe with fixed gear costs but £25 4s., and the two-speed model £28 10s.

The 2½ h.p. Calthorpe-Jap.

Still another new mount for 1915 is a lightweight fitted with a 2½ h.p. J.A.P. engine. This mount follows very much the lines of the two already described, except that it has an Enfield two-speed gear. Chain-cum-belt drive is retained, and other points of the specification are 2in. beaded-edge studded tyres, Druid girder forks, and XL'all pan seat. This machine also has the new design tank and sight feed lubrication. This mount costs £31 10s.

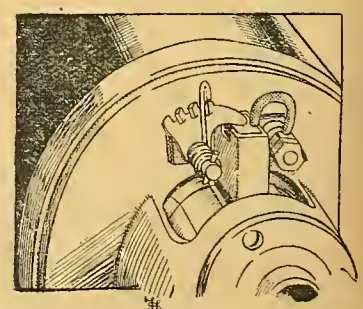
All three new models, we are informed by the Calthorpe Co., have been subjected to exhaustive tests, and will be ready for delivery next month.

COMPLETE ROAD EQUIPMENT.

Instead of the £100 cycle car, which has been called for for so long, we are to have the hundred pound sidecar in 1915. The policy of the Enfield Co., of Redditch, will be to supply a completely equipped 6 h.p. coachbuilt sidecar combination for £100. The equipment will include Lucas dynamo lighting set, Watford speedometer, horn, etc., and will, in fact, be "ready for the road." Buyers will therefore be relieved of the worry of adding accessories after purchase.

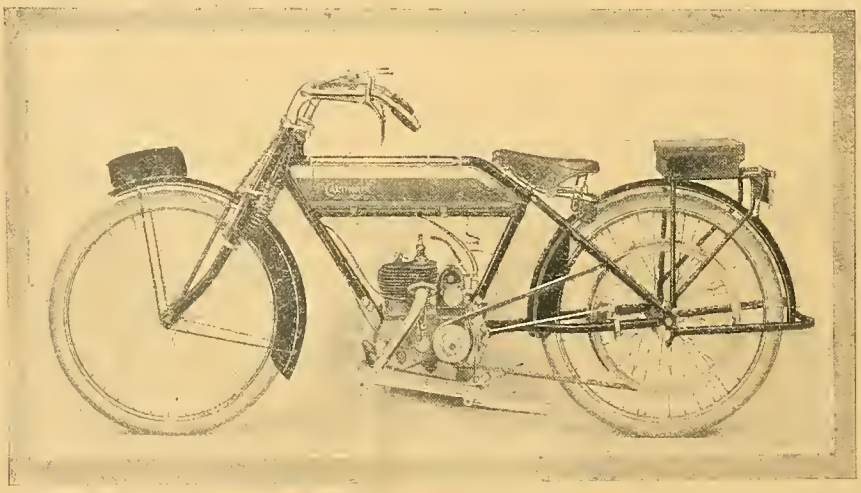
THE LUCAS DYNAMO SET.

IN view of the increasing popularity of dynamo lighting, a few words with regard to the latest Lucas lighting set, which is now ready for the market, may be of general interest.



Neat brush holder with adjustable spring.

We take the dynamo first, as being the current producer, and consequently the most important part. In appearance it is a neat cylindrical device, which is sufficiently small to be carried conveniently on any machine capable of hauling a fully equipped sidecar, and yet



Belt side of the 1915 model Calthorpe Junior.

Latest Designs

large enough to produce a steady current sufficient for the maximum demands to be made upon it.

It is a six volt machine with a full output of five to six ampères, and designed to generate at comparatively low speeds. The full output is, of course, only used when the lamps are lit, and when charging during the daytime it is automatically reduced to four ampères. One of the secrets of the machine's success, besides the simplicity and excellent workmanship, lies in the patented method of electrical control, which provides a constant output at varying driving speeds. The power required to drive the device, even on full charge, is almost negligible, and when switched off there is absolutely no drag.

Strongly Constructed Accumulator.

The battery is intended to be placed under the sidecar seat, and is designed to withstand the most severe vibration, the plates being specially constructed to this end, while the connectors have a thick covering of lead so as to prevent corrosion.

A roller switch is employed, and is so constructed that when the lamps are in use the dynamo is also on charge, so that there is no fear of running down the batteries by carelessness or forgetfulness.

A quickly detachable fuse holder is used, and a supply of fuse wire carried in each set, also a reliable automatic cut-out is fitted to prevent reversal of the current. The whole set, comprising head lamp, side lamp, tail lamp, etc., dynamo batteries, switch, cut-out, and sidecar wiring plug, is thoroughly well made and finished, as might be expected from such a factory, every detail has been most carefully carried out, and the terminals are numbered to simplify attachment.

The switch box is water and dust proof, and the head lamp, with its twenty-four candle power bulb and parabolic reflector, gives a light which is hard to beat for motor cycle work.

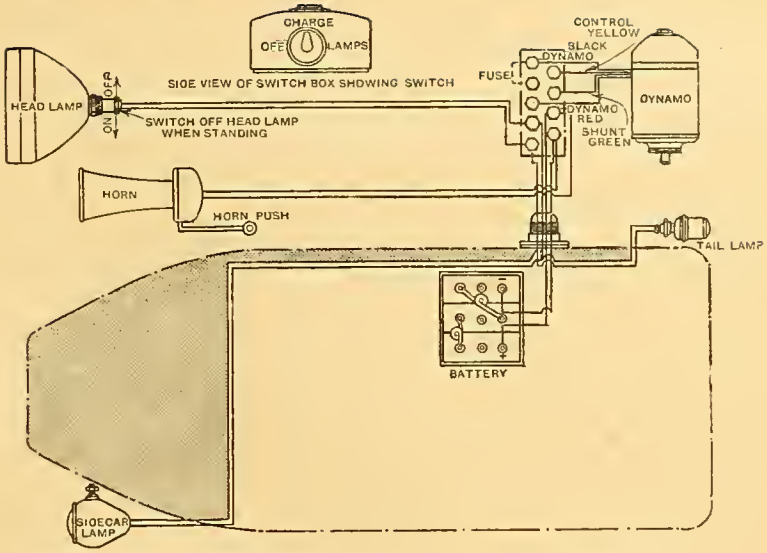


Diagram showing wiring arrangement of Lucas dynamo lighting set for sidecar outfits

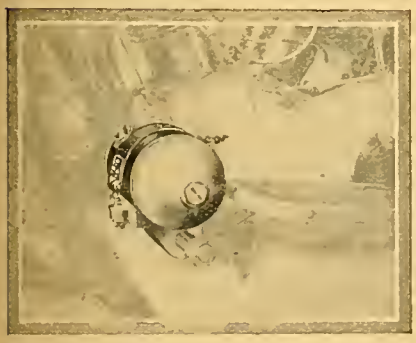
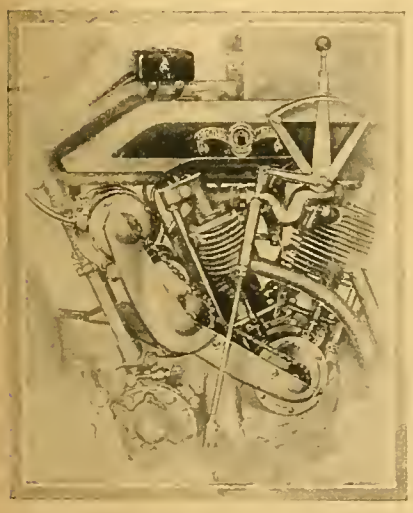
ALTERNATIVE POSITIONS FOR FITTING THE LUCAS DYNAMO



At the forward end of the footboard of a 6 h.p. Enfield

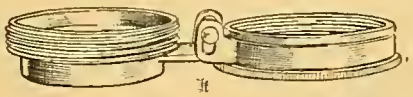


As fitted to a Matchless.

ENOTS ACCESSORIES.

MESSRS. BENTON AND STONE can always be relied on to produce up-to-date fittings for the motor cyclist. A recent visit to their works showed that the war has not kept the firm from going ahead, and their list of novelties is such a long one that only a few of the most interesting items can be mentioned.

The first article shown to us was a neat hinge and screw filler cap, made in such



A hinged screw-down filler cap by Benton and Stone.

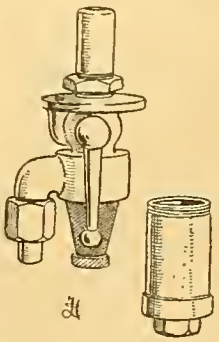
a form that, though it can be quickly opened, its fixing is secure, and the cap cannot come off and be lost.

The drip feed oilers for which the firm are well known have been slightly modified, and the needle for adjustment is now placed on the top, where it is more convenient to reach, while an additional model (described in a recent issue) allows a free flow of oil without altering the normal needle adjustment, for a quarter-turn of a neat little handle has the effect of lifting the valve right off its seating, though it reverts to its previous setting when the handle is returned.

Taps of all sorts and descriptions are manufactured, a very sound line being a form of compression cock seating which renders leakage practically impossible.

A Two-level Petrol Tap.

A very neat little accessory is the combined two-level petrol tap, filter, and drain cock, the design of which is so simple as to be easily followed from the appended sketch. When the tap is in the "on" position, petrol flows downwards to the sump and filter, then back to the petrol pipe, until the level of the spirit sinks to the top of the projecting tube. This gives fair warning that the tank is becoming empty, though a further movement of the tap allows petrol to flow through a hole in the base plate, and thus enables the next garage to be reached in comfort. By removing the sump the device is at once converted to a drain cock.



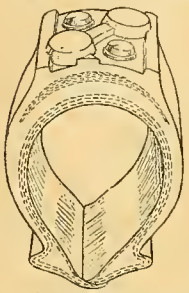
Benton and Stone combined two level petrol tap, filter and drain cock.

A most useful garage accessory which merits the attention of those who clean their own machines consists of a paraffin spray. A container is partly filled with paraffin, and a few strokes of an air pump placed in the top raise sufficient pressure to spray paraffin through a fine nozzle on to the part to be cleaned. A cut-off valve is employed, and the system is found to be most economical and effective.

SOME DUNLOP NOVELTIES.

WHEN one undertakes a trip to the Dunlop Works with the intention of describing new tyres, accessories, etc., one does so knowing that there will be a busy time ahead, and perhaps the chief difficulty is to know where to begin. On the occasion of our last visit this question was somewhat simplified by the fact that the company have made a general reduction in the price of their tyres. This is a point of such importance that it stands first, but still there remain so many novelties that only a selection can be dealt with at the present time.

Tyres are of the first importance, and we are able to illustrate three patterns which are likely to play an important part in future events.



New combination cover introduced by the Dunlop Co.

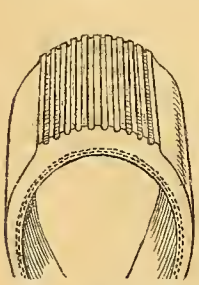
The special 20in. $\times 1\frac{3}{4}$in. tyre manufactured for the Auto-wheel is an interesting piece of work, being made on the most approved motor cycle lines and of stout proportions.

The ribbed tyre for lightweights is, of course, a light and fast tyre, but it is also extremely strong, and the wearing qualities of the rather black rubber are excellent. This type may be obtained for wheels of 24×2in. or $26 \times 1\frac{3}{8}$in. or 2in. or $2\frac{1}{4}$in., and is supplemented by a somewhat similar tyre with a rubber-studded tread.

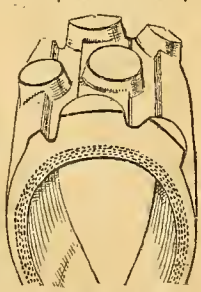
The rubber-studded, heavy type can be obtained through practically every size from 24×2 to 700×65, and is a fine tyre, which will form one of the Dunlop Co.'s strongest lines. As will be seen from our illustration, the section is somewhat peculiar, for it combines a three-rib tread with staggered rows of studs of two different sizes. This tread forms a good non-skid for almost every possible condition of surface, while there is an enormous amount of wear in the tyre, there being a depth of 12 mm. from the top of the stud to the first layer of canvas in the $2\frac{1}{2}$in. sizes.

Steel and Rubber-studded Tread.

A combination tyre on somewhat similar lines, but with steel and rubber studs, and considerably heavier in the tread, forms an excellent tyre for heavy passenger work, and is capable of withstanding the roughest work. Besides this, tyres are made for almost every conceivable use, including racing and sidecar work.

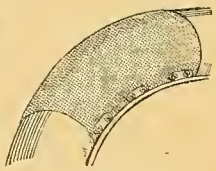


Dunlop lightweight ribbed cover.



Dunlop Standard studded cover.

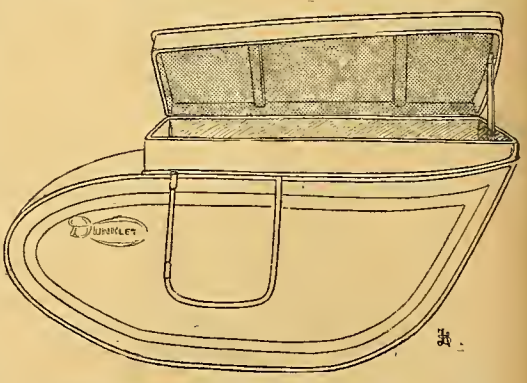
Among the more interesting accessories is a beautifully moulded outside gaiter which tapers to the edges. It is held to the rim by three substantial metal clips on either side, and is such a snug fit that it is practically impossible for grit to get between it and the tread of the tyre. Rolls of "Sure-patch" are supplied, which enable a repair of any size to be carried out, and a neat little automatic solution tube caught our eye at once. It consists of a light metal tube sealed by a steel ball, which is held in place by a spring. When in use, the patch is rubbed over with the ball, which, of course, leaves its seating under pressure and distributes the solution. Repair outfits, the well-known Dunlop belts, and accessories galore are listed, while the name on the article is sufficient guarantee of its quality.



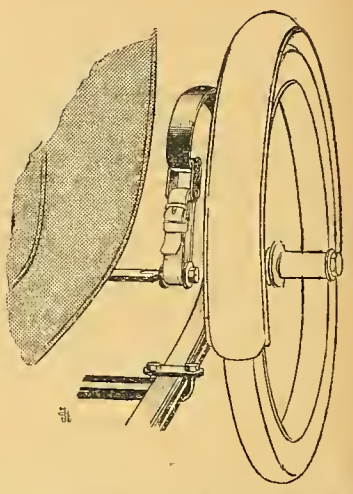
Dunlop moulded outside gaiter.

A SIMPLE SIDECAR CONVERSION.

A SIMPLE solution of the double-purpose sidecar has been evolved by Messrs. Dunkley, of Jamaica Road, Birmingham, and as the standard sidecar is employed, and the conversion a very cheap one, it may attract a large amount of attention. On to the coachbuilt body is fitted a kind of low coaming with a hinged lid; and within, the sidecar body may be protected either by leather flaps or by a special wooden lining box which is attached to the top part. The whole can be very quickly placed in position or removed. The lid has a pivoted prop, which allows it to be left in any desired position for easy access of goods, and the whole is excellently finished. While at the firm's show rooms we inspected an ingenious adaptation of leather springing fitted to a sidecar. Short straps are carried between the spring shackle and the body-supporting bar, and so successful and comfortable has this springing proved that it will be standardised in a slightly modified form on next year's models, and should provide very comfortable riding for the passenger.



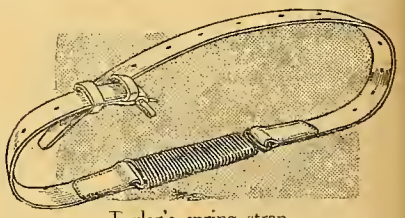
New Dunkley double-purpose sidecar body. The top cover may be removed in a few minutes.



Strap suspension on the Dunkley sidecar.

A SPRING STRAP.

The accompanying illustration shows a spring strap lately provisionally protected by Messrs. H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W.C. The makers state that the objection to existing straps is that they possess little spring and are liable to stretch enormously; and to strap down a solid article such as an oilcan or petrol tank a strap must undergo a certain amount of stretching before a suitable hole is reached; while a new strap, though tight at the beginning, would stretch considerably after a fifty mile run, and the article would be loose, and probably end in being lost. We hope shortly to put one of these straps to a trial and ultimately report upon its behaviour under actual road conditions.

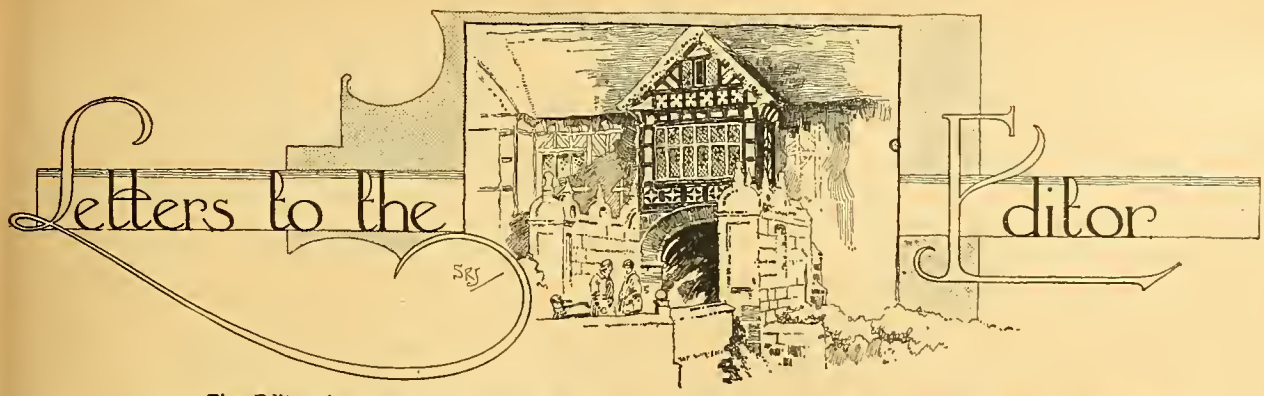


Taylor's spring strap.

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints, half-plate, 1/6 post free; mounted, 1/9 post free. This refers to photographs taken by "THE MOTOR CYCLE" operators.

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.



The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Compressed Air Engines.

Sir,—If "Compressed Air" will blow up a seven inch motor tyre with a cycle pump to the standard pressure of 80 lb. per square inch he will then have some idea of what compressed air means. As to working a motor cycle with compressed air, the above tyre full would only run a motor of ½ h.p. for about *sixty seconds*. The size of a container for the modern needs of motor cyclists can be seen to be quite impossible for practical use. Petrol has all the elements of compression, expansion, and concentration. It will carry a rider over a hundred miles with a gallon, a form of energy totally undreamt of in the days of steam, with its coal and huge boilers. Petrol will carry a rider the hundred miles in the *dark*, a proof that the modern petrol engine is at least reliable, and, moreover, remarkably cheap. Compressed air is anything but cheap. ALBERT V. HUGHES.

The Difficulty of Hearing Sentries.

Sir,—Your correspondent, F. J. Webb, is guilty of somewhat rash deductions as to "Red Indian's" speed whilst riding in the vicinity of the military. I can heartily commend him to come further North to obtain a perfect cure for his uncalled for conclusions. I have been challenged after dark by a sentry some twenty yards ahead, and standing off the road under the shadow of a high wall. I defy anyone to hear such a challenge, and under the given conditions it was well nigh impossible to see the sentry. I failed to do either, and was, consequently, fired on, fortunately without effect. I pulled up in four yards, and whilst actually dismounting, and being then seven yards from the sentry, was fired on again, this time the bullet passing right through my cap, again, very fortunately, without any further effect.

The authorities, whilst expressing regret, inform me that in future some visible sign will be given to arrest the attention of approaching traffic, an act which, whilst doing much to conduce to safer travelling, should eliminate any more regrettable accidents. P.McGUINNESS.

A Defect of Chain Drive.

Sir,—In your issue of October 8th I notice a very serious accident to a despatch rider in France, caused, "it is thought, by the spring link fastener coming adrift." To my mind, this is the greatest disadvantage in any chain drive where these spring links are used. I am unfortunate enough to be forced to use on my 2¾ h.p. twin a chain fastened by a spring link, and while on holiday I was caused considerable annoyance and trouble through this spring link giving way and causing the chain to snap. I was not thrown off the machine, but had I been going down a hill at the time instead of climbing slowly up a steep road, the consequences might have been serious.

My experience of these spring links coming apart is not a solitary instance, but I have come across others who have shared the same fate, with the accompaniment of shattered gear cases, sprockets, etc. The peculiar part is that the chain makers cannot supply a secure fastener, such as fitted to push cycles. I do not recollect ever meeting anyone who has had trouble with a push cycle chain, yet it is just the opposite with motor cycle chains, and when troubles are whittled down, it comes to the one weak spot—the spring fastening link. A man may be lucky and never have a spring link come adrift in years of riding, but another rider, equally careful in seeing that the spring link is fastened in the correct manner, may meet trouble within a few miles of fitting a new chain.

I am informed that the attitude of chain makers is that "the motor cycle makers specify the chain and fastener—we supply accordingly." If this is the case, then surely the cycle makers should wake up on this point, and assist chain drive to come into its own. I should distinctly like to see my own particular machine entirely chain driven, instead of half belt and half chain, but if another chain means doubling the risk of accident through having another spring link to think about, then I prefer to keep the existing short length of belting, which gives over double the wear of the chain, and has but one disadvantage, that of slipping in wet weather. AS 129.

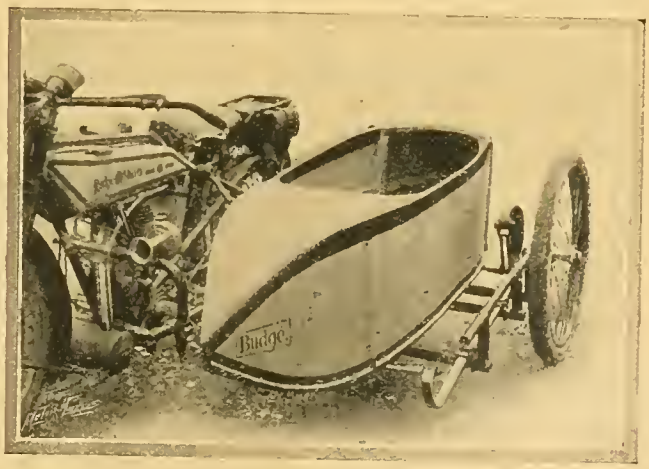
[It is open to any rider to replace the spring fastened link by a bolt and nut, but, personally, we have found the spring link quite satisfactory.—Ed.]

A Double Purpose Sidecar.

Sir,—In your issue of October 8th you illustrated a new double-purpose sidecar made by the Bramble Co.

I enclose a photograph of a body I made in August, which is on the same principle as the one you described. I am having a proper padded detachable seat and back made, and also an apron to cover in the opening entirely. The body is made of three-ply wood, and is very much lighter than my ordinary coachbuilt body.

I think the photograph may possibly be of interest to you, as I use the outfit every day in my business, and you are now booming the motor cycle and sidecarrier for business purposes. R. W. APPLEBY.



A double-purpose sidecar which has been used by R. W. Appleby since August last (see letter).

What are Ideal Handle-bars?

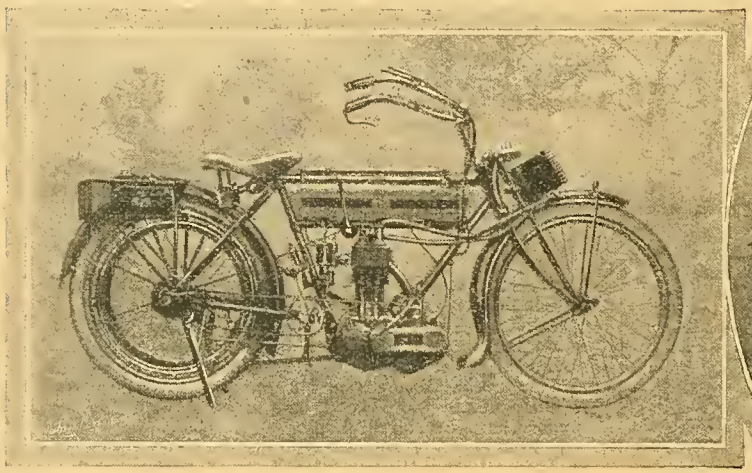
Sir,—Your correspondent "Aysgarth," to judge from his letter, appears to belong to that class of motor cyclist whom the saner members—the "steady and sure riders" whom he affects to despise—have to thank for the existence of police traps, speed limits, and other restrictions upon the reasonable use of the highway. It is unfortunate that a comparatively few motor cyclists, whose chief delight in life is to go "all out" and "corner at speed," should continue to bring odium upon a splendid pastime, as they undoubtedly do. Repressive measures of the strongest kind should be taken with those who indulge in these feats anywhere except on tracks prepared for the purpose. I am a motor cyclist myself, and though not necessarily slow, thank heaven I can call myself

SURE AND STEADY.

A Trapper's Machine.

Sir,—I am enclosing a photograph of my 1913 three-speed Sturmey-Archer free engine Triumph fitted with an exhaust valve cooling cap and radiating tank of my own design and manufacture. The tank holds half a gallon of water and is most efficient, as, push the engine how I will, I have never made the water boil. I note there is a similar outfit advertised for sale at £3 3s., only the tank is fitted at the side instead of the front, which is the correct position, in my opinion.

The country here is virgin sand and heavy forest, with no roads, except the railway line, and most of my friends thought I was mad when I got the machine, but I have succeeded in cutting a narrow path thirty miles long through the forest, and, by laying grass down, I can go over it fairly well, though it is but rarely I can use the top gear except during the rainy season, when the sand gets harder. I have large traps for lion and leopard set on the side of my path, and the bicycle enables me to examine them with a minimum of effort.



A 1913 Triumph fitted with a Sturmey-Archer three-speed gear, and a home-made water-cooled exhaust valve cap.

The necessity for long runs on middle and sometimes bottom gear, coupled with the attentions of a tropical sun, make some form of cooling other than that ordinarily provided a great help. I had the first push bicycle up here nine years ago, and the niggers used to smile and say, "Look at the white man, who would sooner work than walk." A thirty-mile walk is nothing to them.

There are two other motor cycles at Livingstone, eight miles from here, where there is a road one mile long, from the station to the town, and these machines—a 2¾ h.p. Douglas and a Motosacoche—are owned by doctors. However, I have the pioneer motor cycle on this side of the river, and I must say it stands up to the awful gruelling I sometimes give it most splendidly. I have 2½in. Clincher Dreadnought tyres, which are better than the original 2⅜in. for going over the sand. I would like a machine with more clearance and 3in. tyres.

A three-speed gear is absolutely necessary. Mudguards are quite efficient, but should be fitted with a scraper fitting around and within about ¼in. of tyre. There is a black soil in some parts around here, which simply piles up on the tyre during the rains until the wheel jams. I have seen many letters from Overseas correspondents saying "larger mudguards" are necessary for Colonial requirements, but a scraper would cut mud off as it was picked up. I am going to make a pair before the next rains.

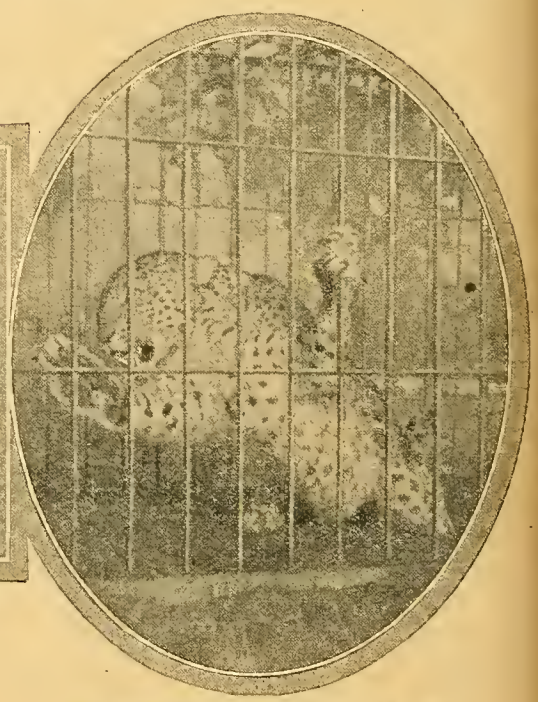
I have had no experience of any make of motor cycle other than the 1913 Triumph, but if there are any better or more reliable they must be phenomenal, as my trusty Triumph is trusty indeed, and, given fair care, simply refuses to go wrong.

I am enclosing also a photograph of a recent capture in a home-made cage. This is hardly to do with motor cycling, but it was undoubtedly owing to the facility for covering a much longer trap line (thanks to the machine) that I was enabled to get it.

The nearest repair shop is at Bulawayo, 280 miles away, where there are fair roads and a multitude of motor cycles, etc.

Trusting you will find this letter of interest, also the snaps, and wishing *The Motor Cycle* all success,

Victoria Falls, South Rhodesia. J. W. SOPER.



A leopard caught by a reader near Victoria Falls, South Rhodesia (see letter from J. W. Soper).

Running Costs.

Sir,—The cost of running a 1914 two-speed 2¾ Douglas from March 10th to October 10th over a distance of 5,400 miles has been as follows:

	£	s.	d.		Per mile.
Tyres	5	5	0	...	.233d.
Petrol	6	0	0	...	.266d.
Oil	1	4	0	...	.053d.
Transmission	1	8	6	...	.054d.
Overhauls and renewals ...	1	15	0	...	.077d.
	£15	12	6	...	.683d.

The cost of the tyres, chain, and belt on the machine when new is included in the above items, as these must be reckoned if the actual cost of running per mile is to be arrived at correctly, though, of course, if they are included here, there must be an allowance made for them in depreciation.

Accessories I do not count in running costs. On lamps, horns, speedometer, and odds and ends, I have spent

about £6. Depreciation, too, should be reckoned, I think, at so much per annum and not so much per mile. My machine is now worth about £37 10s.

Petrol consumption was, at first, 73 m.p.g. I have recently fitted a Binks, which gives much better results—about 95 m.p.g. If depreciation, accessories, and licence are all included, the total cost per mile works out at just 1½d.

The renewals include some piston rings, one gudgeon pin, various valve springs, and one exhaust valve. E.W.B.

Gear Slip on an Old Machine.

Sir,—I wonder whether any of your readers could give me a tip about my P. and M. two-speed gear. I have a 1910 machine, which I have only ridden some 4,000 miles in all since buying it in working order in 1913. The high gear persists in slipping. It has been three times in the maker's hands, and they have renewed wedge bars, etc. On one occasion an expert told me I had been oiling too much. On another the works reported I had not been oiling enough. Now for the third time the same symptoms are appearing, slip on high gear, *not* at spring drive. If any of your P. and M. rider readers could make any suggestion from their experience I should be much obliged, as I have only done one hundred and forty miles since the last overhaul, and I am confident that others find the gear satisfactory. B 10.

A Comedy of Errors.

Sir,—The following incident may, or may not, be of interest to some of your readers. In any case I must confess that, with some years of varied experience on the road, I have never before been subjected to such doubtful courtesy as befell me recently.

A friend and myself, both riding solo, started off in the morning for a short run; the run, however, was destined to be somewhat briefer than we had expected, for, within five miles, my companion broke down with magneto trouble. After some delay I returned to a garage, borrowed a rope from a young mechanic working there, and in due course arrived back with the disabled machine in tow. In all hospitality we were invited to stand the machine in the shelter of the workshop, and, there being no available assistance, save for the mechanic, who continued complacently at his work, we ventured to set about removing the magneto ourselves. Subsequent events, however, proved this to be a gigantic liberty and gross breach of etiquette in the mechanical world; though committed, I beg leave to state—for myself at all events—in all ignorance. But the enormity of our crime was quickly brought home to us with the appearance of the owner of the garage, who introduced himself by a peremptory demand as to the name of our firm! Now, it is not every motor cyclist who has the privilege of being a member of some firm, and we were perforce obliged to admit ourselves but humble tourists. The next question demanded whether he or we were doing the job; a pertinent question, certainly, but the answer should have been obvious, as the one and only mechanic present had previously made his departure. A slight argument ensued in which we pointed out that we were anxious to get the repair done as soon as possible and should be glad of such skilled aid as he might be able to afford us: our friend, on the other hand, pointed out to us (in none too polite terms) that our presence was not essential to a speedy repair. Under ordinary circumstances we should have been willing to agree with this, but our friend's hostility, together with the general appearance of lack of industry, led us to suppose otherwise. The upshot was that both we and our machines were consigned to a place all good Christians hope to avoid, the doors were opened, and we were cordially requested to "get out!"

It was greatly against the garage owner's will that we reassembled the parts we had removed from the machine, during which operation we were subjected to a homily to the effect that never in all his years of experience and ownership had he before been so insulted and "wiped the floor with" on his own premises. This latter phrase, evidently a favourite expression of his, though rather tedious in its repetition, accompanied us to the gates, whence we departed quietly.

Though our crime may have been inexcusable and possibly have merited the treatment we received—though I find it hard to believe this—we both came to the conclusion, at lunch, that we would not have missed our little comedy for worlds! Our only fear is that some less docile individual than ourselves may give our worthy entertainer cause to bemoan his favourite lament otherwise than metaphorically!

S. R. DUEL.

Christmas Gifts for Despatch Riders.

"The Motor Cycle" Shilling Fund to Provide Useful Presents for Motor Cyclists at the Front.

EVERY week, one may almost say every day, brings its quota of appreciation of the useful and invaluable work rendered by motor cyclists at the front. As a despatch rider, the motor cyclist is proving his real worth, and from all sides praise is being bestowed upon him. Very soon his services are to be extended, for in the Canadian contingent is a number of sidecars with quick-firing guns mounted on the chassis, and we believe we are giving no secret away when we state that very soon a fleet of these sidecar-mitrailleuse will be attached to the British Army, for, practically at the outbreak of hostilities, the formation of such a corps was decided upon, and, owing to its mobility, it seems likely to prove exceedingly useful.

The fleets of armoured cars, too, have their motor cyclists; the cyclist corps are invariably accompanied by riders of the power-propelled bicycle, and motor transport sections have their motor cyclist mechanics and other riders whose duty it is to keep up the lines of communication.

These many uses prove that the services of motor cyclists are generally appreciated, and that they are proving an effective arm of the service. How readers may show their sense of gratitude for the important part motor cyclists are playing in the war has been receiving the consideration of *The Motor Cycle*, and it has been decided to inaugurate

A Shilling Fund

to purchase some small but useful articles, such as gloves, muffler, handle-bar muffs, or an abdominal belt, as Christmas presents. As to the exact form the gifts shall take, we are inviting opinions from some of the motor cyclists on active service. Readers of *The Motor Cycle* are invited to send their shillings to the fund, and all amounts received will be duly acknowledged in these columns; to clubs in particular we appeal to give the fund a real send off. All the valuable work which is being performed by motor cyclists with the Expeditionary Force is bound to have a good effect in extending the movement considerably as soon as hostilities cease, and the little antagonism which existed against motor cycles in this country will be killed once and for all.

Contributions should be addressed to The Cashier, *The Motor Cycle*, 20, Tudor Street, London, E.C., and the envelopes marked "Shilling Fund."

A similar fund to provide drivers of motor transport vehicles (included in which body are many motor cyclists) with Christmas gifts is being raised by our sister journal *The Autocar*.

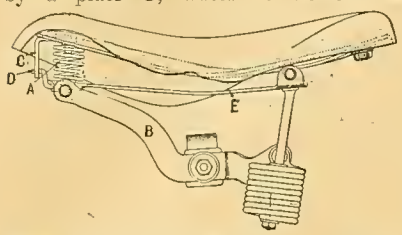
PATENTS

BY

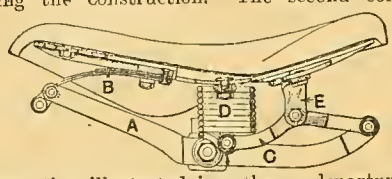
ERIC W WALFORD.

Saddle Improvements.

Two patent specifications have just been published by a leading firm illustrating new features in motor cycle saddles. The first construction illustrated comprises a system of springing for the peak of the saddle. This comprises a coil spring A mounted upon the front of main frame B. This coil spring supports the front of the seat, and excessive movement is prevented by a plate C, which is slotted and



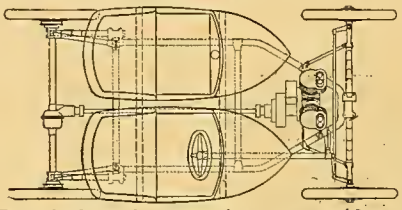
passes over a projection D on the fixed part. A radius plate E extends to the rear of the seat and assists in strengthening the construction. The second con-



struction illustrated is rather a departure from the usual method of suspension. The main frame A supports the front of the seat by means of a laminated spring B, whilst pivoted at the back of the frame A is a lever C, the front end of which is attached to a coil spring D. Midway in the length of the lever C is attached a depending lug E carried by the seat. Thus, as the load comes upon the seat, the front end of the lever C moves downward under the restraint of the spring D.—B. Brooks and J. Holt, Nos. 19,292, 1913, and 23,480, 1913.

A Cycle Car.

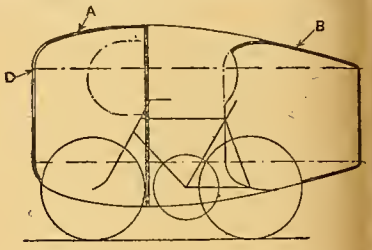
This vehicle has a tubular frame suspended by a transverse spring in front and two quarter springs at the back.

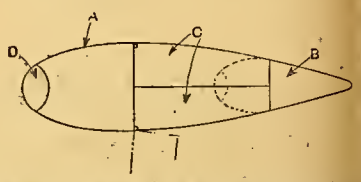


The bodywork comprises two sidecar bodies arranged as shown, these being fixed to the frame, which is spring supported as mentioned. The vehicle has a live axle driven through planetary gearing. The front mudguards swive with the steering wheels.—T. Norton No. 3,368, 1913.

A Streamline Body.

This streamline body, though primaril designed for a push-bicycle, may be o interest in view of the references t the subject in this journal. Really ther is not very much in the invention besid the actual shape of the body, which ca





be easily gleaned from the drawings. The body comprises a nose A and a tail B, between which are hinged side pieces C. At D is provided a window, and the body is, of course, slotted to accommodate the wheels.—E. Bunau-Varilla, No. 22,510, 1913.

New Tyre Depot.

The Kempshall Tyre Company have appointed a Midland depot in Coventry at 6, Warwick Row. This depot will be under the management of Mr. G. R. Bromley, who has had a long connection with the motor industry.

The Coventry Chain Co. and the War.

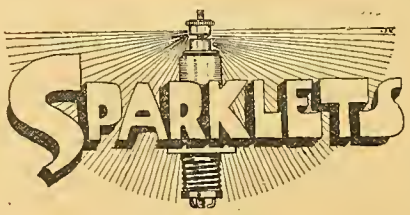
The Coventry Chain Co., Ltd., Spon End, Coventry, inform us that up to date 130 of their employees have rejoined the Colours or enlisted since the beginning of the war. They hope to reinstate all those who re-apply at the conclusion of hostilities. The company is paying reservists' wives 7s. per week and 1s. for each child.

Excelsior Exploits.

We have received from Messrs. Bayliss, Thomas, and Co. Coventry, a booklet, nicely illustrated from photographs which have appeared in this and other journals, detailing the many hill-climbing feats of W. H. Carson on a 6 h.p. Excelsior sidecar outfit. Any reader can have a copy on application to Messrs. Bayliss, Thomas, and Co.

Four Hundred Fighting Men in One Firm.

Patriotism of a practical form is the best sort of all, and many firms connected with the motor cycle industry have provided many men to serve the country. We now hear that no less than 400 of the staff of the North British Rubber Co., Ltd., have joined the forces of the Crown, either as Territorials or Reservists, and, furthermore, the company will care for the wives and children of the married men who have entered the ranks.



A Notable Success.

Shell spirit was used on the all-British Green engine which won the £5,000 prize in the recent naval and military aeroplane competition.

A Spring Carrier.

A spring carrier, which can be readily attached, has been placed on the market by the T. Eltringham Henderson Co., 25, Albion Road, North Shields. Four hook clips are provided for attachment to the bars of the carrier, and, under working conditions, this device should be very effective.

Hub Gears at the Front.

Sturmey-Archer Gears have received a large number of orders for three-speed hubs for motor bicycles for the Government and various branches of His Majesty's forces. These gears have, up to the present time, come through the campaign very satisfactorily, and a testimonial has been received from a despatch rider who had to perform arduous services during day and night over all kinds of roads, and, despite the severity of the duties he had to perform, the gear stood up and had not given the slightest trouble.

To Remove Tar Stains.

A tar removing solution has been put on the market by Messrs. J. E. Feay and Co., 12, Jackson's Row, Manchester, in the form of a fluid, which is known as Tarof. The application is performed by means of a soft cloth, and it is claimed that the tar can be removed without damage either to the varnish or paint.

Army Contract Work.

Messrs. Beard-Brown and Co., of Northampton, the makers of the College mud shield and other accessories, are very busy with Government orders, and are working overtime and on Sundays. Those customers whose orders are somewhat delayed in consequence will understand the reason.

Equipping the Motor Cycle for War.

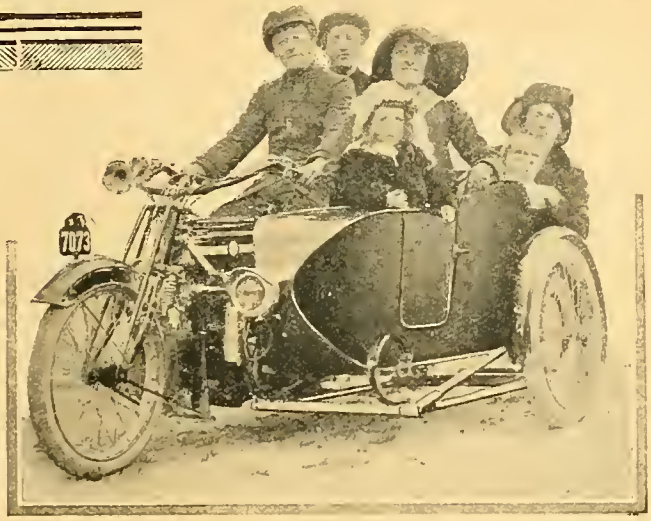
The use of motor cycles under service conditions makes imperative a completeness of equipment which, for ordinary riding in a peaceful country, is perhaps more a comfort and convenience than an absolute necessity. Consequently, J. B. Brooks and Co., Ltd, are meeting a very large demand for such specialities as spare belt and spare tube cases, tool bags, carrier bags, sparking plug cases, carbide carriers, etc., as well as for saddles. For the cyclist battalions Brooks are supplying large numbers of their Military model saddle, special tool bags, rifle clips, kit carriers, etc., and their general department is working at high pressure to meet the demand for such accoutrements as officers' sword belts, cartridge bandoliers, cases for field glasses and range finders, sleeping valises, Army kit bags, etc.

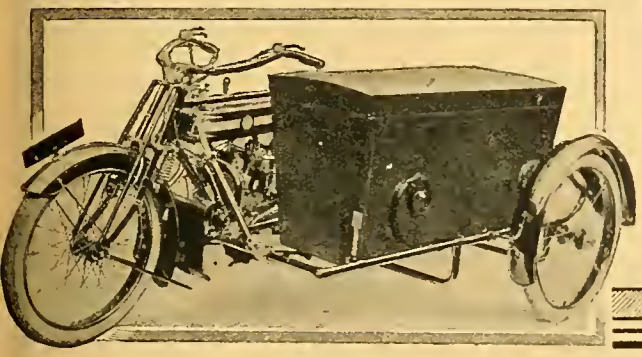
REX-J.A.P.

"The Proved Best Sidecar Machine."

For Business or Pleasure—

We manufacture Commercial Sidecars of several types and sizes to suit customers' own requirements.
We also manufacture Commercial Bodies, interchangeable with our ordinary Pleasure Bodies—so that the combination can be used for carrying goods or passengers.





The REX-J.A.P. in ITALY.
Climbing a hill 5 miles long, with an average gradient of 1 in 7, with 6 passengers.

¶ The Rex-J.A.P. is fitted with Countershaft 3-speed Gear—enclosed Chain Drive—Kick Starter—and many other desirable features.—May we post you Catalogue ?

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

ESTABLISHED 20 YEARS "IN THE HEART OF THE TRADE"

COLMORE DEPOT

Clearing our 1914 stock

Every 1914 Motor Cycle and every 1914 Light Car in our stock is going to be sold by us *now*; we intend carrying none of them forward.

They are good, well-known makes, all of them, and now is your chance.

This week's price **20%** off ordinary,

next week those unsold will be **25%** off the usual,

and the week after they will be **30%** discount from usual nett list,

so that we shall then have nothing left to push on to 1915 buyers

Now the above means our loss!

But it will be your gain!!

Someone is sure to tell us it is foolish to sell below cost. We shall reply that it is yet more foolish to "stand still" in business.

Get on to these bargains, say what make you want, and write now to one of

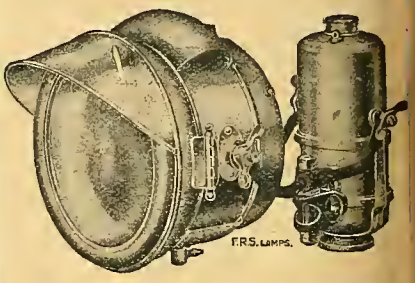
F.R.S.
LAMPS AND GENERATORS, HOLD WORLD'S RECORDS.



FAMOUS BEAM

Coupled with the F.R.S. Lamps is now known all over the world. **NO OTHER MAKE** can compare with it. It is dearer no doubt, but isn't it worth it? The best is always cheapest, and you positively **RIDE IN DAYLIGHT** through the night.

Lens.	Beam.	Price.
6 in.	1,200 ft.	72/6 and 78/6
5½ in.	1,000 ft.	62/6 and 68/6
4½ in.	800 ft.	52/6 and 58/6

READ THIS.

To get the best you must pay well. We have made our name with quality alone, and we claim that our lamp is up to

90% more powerful

over any other make. Our lens is costly, and it is genuine. You will see what a costly mangin lens can do, if you try the light of the F.R.S. against any other.

F.R.S. Lamps, Pershore St., B'ham.

Manchester Agents: Messrs. Feay and Co., 12, Jackson's Row, Manchester.

OVERALLS MADE BY A PRACTICAL RIDER

THE MAN WHO RIDES KNOWS WHAT IS WANTED.

I have over 10 years' experience as a rider in all weathers, and I have gradually perfected a suit of overalls to meet my own requirements as a traveller.

The business rider needs to keep smart—dry and comfortable. Whether you ride for business or pleasure, these conditions are essential if you are to enjoy your riding. Don't throw away your money on things that are absolutely useless for your purpose.

I have explained all about this subject in an illustrated booklet. You'll be interested—send a postcard for it to-day to I. SMITH.

MOSLEY & SMITH
Buttershaw, Bradford.

Vevo Works, Park Lane, ASTON, BIRMINGHAM.

PUNCTURES HAVE NO TERROR
IF YOU USE THE **RICH** DETACHABLE AIR TUBES
With free air passage. No butt ends to burst.
Made in all sizes, 1¾ to 3½.
Reduced price .. 26 x 2, 11/- 2¼, 12/- 2½, 14/6.
Endless or butt ended converted, **5/-** and **6/-**
Address: **RICH, Crawley, Sussex.**

REPAIRERS.

ALUMINIUM Crank Cases, gear boxes, etc., repaired neatly and promptly without distortion.

WELDING Broken Cylinders, pistons, flanges, lugs, frames, and a thousand other things repaired and guaranteed by Weldings, Ltd., 37, Holt St., Birmingham. [8030

WELDINGS, Ltd., Dept. M.C., 235, Gt. Ancoats St., Manchester.—Oxy-acetylene welding experts.

BROKEN Flanges, valve seats, pistons, crank cases, water jackets, welded and machined complete.

SEND Your Old Engine or complete machine for overhauling, re-bushing, cylinders re-ground, new pistons, rings, and gudgeon pins fitted.—Weldings, Ltd., Dept. M.C., Manchester. [6234

LET me quote you for frame modernising, engine overhauls, bushing, etc.—Syd. Pearson (see Miscellaneous). [X1499

CYLINDERS, Crank Cases welded; quotations free; send your enquiries.—Premier Motor Co., Aston Rd., Birmingham. [0248

OXY-ACETYLENE Welding, first-class work; moderate quotations.—Purcells, 78, Charlotte St., Tottenham Court Rd., W. [6750

CRACKED Cylinders, castings, forgings, etc., successfully repaired by Lea's metallurgical process.—Lea, Engineers, Runcorn. [5197

WELDING.—All metals, cylinders, and crank cases. We have the plant, experience, and method for every job. Quick delivery.—Below.

CYLINDERS Re-ground, new pistons fitted, complete with rings, etc.; 22/6.—Oxy-Acetylene Welding, 349, Lillie Rd., Fulham. 'Phone: Hammersmith 1617. [6430

WELDING.—Broken cylinders, flanges, pistons, crank cases repaired and machined; worn valve seats built up, cracked seatings welded and machined.

CYLINDERS Re-ground, new pistons fitted complete, worn parts duplicated.—West London Welding Co., Essex Place, Chiswick. Tel.: 536. [7104

CCCCCCCCC Cylinders Re-bored, new pistons fitted, bear 13 stone on compression.—Gradior Machine Co., Compression Specialists, Stafford. Est 21 years [7314

MINERVA Spares, cylinders ground, pistons fitted, re-bushing, parts duplicated. — Ellenborough Motor Works, Ellenborough Rd., Wood Green, N. [8394

PISTON, fitted with top and bottom, step-cut rings, hardened steel gudgeon pin, and your cylinder re-bored and ground. 24/-. — C R Foster, Kirkstall Rd., Leeds [0310

EVERY Repair is guaranteed; every repair is machined ready to fit; every repair has immediate attention; and everybody sends to Weldings, Ltd., Holt St., Birmingham. [8031

REPAIRS.—Now is the time to have your motor cycle overhauled. All kinds of repairs at lowest prices.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., opposite Olympia, London. [8019

HAVE your Morgan converted into Grand Prix model, or let us fit a new up-to-date body as illustrated last week.—Oaklelgh Motor Co., 65a, Rosendale Rd., West Dulwich. [8097

UNBREAKABLE Chrome-nickel Valves. — Numerous testimonials prove superiority. Guaranteed one year. Any make, 3/6 each, 6/- pair, free per return.—Capacity Tool Co., Broseley, Shropshire. [X0693

CYLINDERS Re-ground; new pistons fitted with step-cut rings and hardened gudgeon; overhauls; re-bushing. Quotations free.—The Motor Repair Co., Stretford, Manchester. [X1490

TONGE Welding Works, 174, Oldham Rd., Middleton, Manchester.—Experts in broken cylinders, crank cases, etc. Welding aluminium a speciality. Nothing too difficult. Sound work at moderate charges. [1389

FRAME Alterations.—Triumphs, Rexes, Minervas, or any make cut down and modernised; smertens the appearance, adds pounds to value of machine, and gives 4 to 6 inches lower riding position. Estimates free.—Below.

ENGINE Efficiency.—Cylinders re-ground, new pistons fitted; highest efficiency and skilled workmanship guaranteed; phosphor bronze bushes from 2/6; valves and seatings ground true, 5/- pair; estimates submitted.—Patricroft Motor Co., Patricroft, Manchester. [7943

COMPRESSION.—Cylinders re-bored and ground, new pistons, rings, and gudgeons, complete, 16/-; overhauling, re-bushing, efficiency guaranteed.—Reliance Motor Engineering Co., Spon Lane, Smethwick, Birmingham. [7282

F.N. Owners Note.—W. Earl, late foreman at the Highbury repair works, is at your disposal for all repairs. Our special engineering plant and the personal attention of a recognised F.N. expert will ensure best results at minimum expense.—Below.

F.N. Spares; special announcement.—We have a large stock of new, also sound second-hand, parts. Enquiries solicited.—Below.

3-SPEED Gears for any model 4-cyl. F.N. Special offer during war period only. We will make liberal allowances for older pattern gears in part exchange for our latest 3 or 2-speed gears. Particulars and quotations gladly on application.—Below.

WE have a few second-hand gears at bargain prices.—Earl's Engineering Works, 5, Heath St., Hampstead. 'Phone: Hampstead 3287. [X1514

STANLEY

FROM FIRST TO LAST

you cannot find any better

BELT FITTINGS

than those that bear the well-known name—

STANLEY

There is the

'STANLEY' FASTENER

as used by the T.T. Winner. Used wherever motor cycles are used. The BEST at any price. Nickel finish. Hardened and tempered hook and flanged pins. Never breaks. **9d.**

The

"STANLEY" SPARE LINK

—the best belt length adjuster yet invented. Saves time, trouble, and money. Saves the cost of a new belt. (Note how easily it is slipped in.) **1s.**

THE "STANLEY" SHIELD

protects the belt fastener, prevents wear of the pulley, and conserves power. Specially designed for use with the Philipson Pulley. **8d.**

'Stanley' Adjusting Hooks 6d. for 3.

"Stanley" Belting, from 1/3 per foot.

"LION" Fastener, 6d.

Guaranteed 5,000 Miles.

Send p.c. for booklet, "Belts and Belt Fittings."

REPAIRERS.

LOWEST Prices Quoted for any repairs or complete overhauls to motor cycles, cycle cars, or cars, or work done on the premises and fully guaranteed; cylinders cleaned by oxygen process, 2/6 single, 4/6 twin.—Maudes, 136, Gt. Portland St., W. [7348

MORMAN and Bliss, London Rd., Hounslow.—Reduced prices during war. C.I. pistons, rings, and gudgeons, from 9/6; bushes, 2/-; valves, 3/-. Simplex steel pistons, hollow connecting rods, supplied to order. Special silencers, aluminium ends, steel barrel, and extension pipe, smart, efficient; twins 18/6, singles 14/6. Illustrated list free. [7541

WAR, because of it we need work. Our need is your opportunity. To keep our factory going we shall sell at virtual cost. Cylinder re-bored, fitted complete new piston, rings, and gudgeon, 15/6; re-bushing equally cheap; frames altered and repaired, welding successfully executed, and every description of motor work undertaken. Each job finished in Tennant's irreproachable style, and bears full guarantee; thorough satisfaction assured. Present quotations hold good only if work is sent immediately. Our standard rates will be charged as soon as normal times return.—Tennant Engineering Co., Pershore St., Birmingham. Official repairers A.C.U. [X1545

A Clean Slate.

EVERYONE is by this time pretty well agreed upon the great value of the motor cyclist despatch rider at the front, and it is certainly the case that the work requires very considerable pluck—not to say courage—and most of the men are young. Now, put a young and plucky man upon a motor cycle and in most cases you will have the kind of rider which may be described as dashing, or even rash, and it may be taken for granted that the dashing rider at home will make the best despatch rider at the front. By this we do not mean that reckless riding is desirable, for the opposite is most decidedly the case, but that a man who does not object to taking risks will make the best despatch rider. So many risks come from outside that the wise despatch rider will not add to them by careless riding. This brings us up to our point. Despatch riders being gathered from the class which we have designated as "dashing," there must be many men among them who in some cases deservedly—in others not—have had their licences endorsed. In fact, we know of one who has done much useful work for his country whose licence has been suspended altogether for some little time. We all know that licences are often endorsed for very trivial faults. This does not lie altogether with the magistrates, who have no option but to endorse a licence for offences under the Motor Car Act, but an endorsement is a blot for ever.

We, therefore, think that it would be a gracious act if the Home Office would remove the endorsements from the licences of all those who have served their country in this war. This would be some small recompense for their loyalty and valuable services, and it would be much appreciated by the riders themselves, who, in many cases, would take great care that a further list of endorsements would not accumulate against them. Therefore we say, "Let all endorsements and suspensions be removed, and let despatch riders start again with a clean slate."

Petroil Lubrication.

SIGNS are not wanting that the system of lubrication which has come to be known as "petroil" is going out of favour. This method of mixing the lubricating oil with the petrol is commonly used on two stroke engines; indeed, during the current year, it has been easily the most popular form of lubrication system, but it has its shortcomings, as those who have used two-stroke machines extensively will admit. It would appear that the chief objection to the "petroil" system of lubrication is the messy condition in which it leaves the carburetter, both interior and exterior, petrol pipe, and, in fact, everything with which the mixture comes into contact. In short, the best motor cycle loses that clean and neat appearance characteristic of the modern machine by reason of the petrol carrying the oil with it, depositing itself everywhere, then evaporating and leaving a yellow sticky mess.

But almost the same condition of affairs, it is found, applies to the interior of the engine, for carbon deposits form quickly—quicker even than with a four-stroke—and render the inside of the piston, the piston ring slots, and the ports partly clogged. There is also some difficulty with the mixture after a machine has been standing on a cold day, for should the oil used be only slightly too heavy, it settles on the bottom of the tank and forms one homogeneous lump which can and does cause erratic running for a time. All this is extremely unfortunate, it will be agreed, for the "petroil" lubrication is at once the most simple and foolproof system of lubrication ever evolved. A throttle controlled lubricator is surely ideal and perfectly automatic. It relieves the rider of all lubrication worries. From these considerations alone, it is to be hoped that some discovery may be made that will overcome the objections outlined; the two-stroke is essentially the most simple type of motor cycle in existence, and the simple petroil system of lubrication is entirely in keeping with the design.

The Splitdorf Magneto-cum-dynamo.

I am sure British riders were keenly interested in our exclusive announcement (see issue of August 27th) of the new combined magneto and lighting dynamo, placed upon the market by the leading American firm, the Splitdorf Co. For an electrical ignoramus like myself, the surprise lay in the abandonment of permanent magnets. In a cursory perusal of the illustrated description some of our readers possibly omitted to notice that the horseshoes are not permanently magnetised, but require to be "excited" by current from the accumulator. Prior to starting the engine, the horseshoes are magnetised by a few pushes of the kick starter; the motion thus supplied feeds current from the battery *viâ* a centrifugal governor contact to the armature of the lighting dynamo (*i.e.*, the upper of the two armatures, snugly placed under the arch of the horseshoes). This magnetises the horseshoes, and the engine can then be started in the usual way An electrician's comments on the reasons for this design would interest many of us.

Pros and Cons.

This novel arrangement is obviously far neater than the use of a bulky separate dynamo, driven by a V belt off a gear box pulley, or other similar device. On the other hand, it is clear that if the battery should fail for any cause, the engine as well as the lamp will be thrown out of commission. This possibility may arouse the dour suspicion which is one of our principal national characteristics; but it must not be forgotten that modern batteries are far more reliable than those ancient prototypes which made motor cycling such a chancy business prior to the introduction of the high tension magneto; and, furthermore, that a battery which is constantly being replenished by a dynamo works under far more favourable conditions than one which is first charged off the machine, and then rapidly discharged on the machine. Altogether, one would prophesy that the combined device ought to sweep the field eventually; but that the fear of the dual failure will leave room for separate dynamos to enjoy a market during the next year or two. By the way, will the Kaiser (who is sure to be one of our readers!) kindly inform us *viâ* Marconi House what Herr Bosch has in store for us after the Treaty of Berlin?

An Unusual Trouble.

The other day I was riding a 5-6 h.p. twin when my catalogue of experiences was enlarged—there cannot be many troubles which I have not sustained. One cylinder chipped out suddenly, and against the low under hum of the surviving cylinder I heard some frightful backfires, and saw cones of black smoke shoot out of the carburetter air intake. "Back inlet valve gone!" quoth I, as I dismounted; but to my surprise the back inlet valve was as sound as a bell. I was absolutely at a loss for a second or so, but on revolving the engine I noticed that the back exhaust tappet was motionless, its actuating rocker having presumably snapped without affecting any other detail of the valve gear. What I had taken for the spit of half-explosions past a permanently open inlet valve were the results of collisions between the exhaust gases and the incoming charges, producing combustion in the inlet pipe. As the exhaust valve of the back cylinder was permanently shut, the exploded charge in this cylinder could find no egress till the inlet valve opened, when the pent-up flame of the burnt gases hit the next fresh charge head on, and fired it in the inlet pipe. I had no spares for the valve gear, and was on my way to an urgent appointment.

How I got Home.

A great many years have passed since I last found myself by the roadside with but one cylinder of a twin operative, and my memory on such points was a trifle rusty. I took out the sparking plug and compression tap of the useless cylinder, and tried to start up on the other cylinder, but too much air reached the carburetter through the two naked orifices, and the engine would not start. So I replaced the compression tap, and the engine then started readily on the front cylinder, and pulled well so long as I kept the throttle full open, and the air lever shut, but it choked from excess of air if I moved either lever. On the top gear of 3¾ to 1, the machine easily touched 30 m.p.h. on one cylinder, and on the lower gears it climbed hills up to 1 in 12 quite comfortably.

Where the Motor Cycle should Score.

This calamitous run provided me with an illustration of how motor cycle transit scores in some localities. I had covered forty-one miles when the rocker broke, and I may confess without shame or penitence that the distance occupied me no more than seventy minutes, for it was along broad and unpopulous roads, and heavy rainstorms had driven everybody else indoors. The return journey by train occupied me precisely 4½ hours, which included two changes followed by weary waits.

Crystallisation of Single Forks.

Will some eminent metallurgist give us his authority on the subject of ungirded front forks? Most of the current year lightweights had single-blade forks, and one remembers that in the early days of motor cycling several eminent riders were killed by the fracture of such forks. On the other hand, the primitive forks were rigid, and the modern forks are always eased of the main stresses by means of springs, *e.g.*, in the Druid patent. Can the single blade forks of the modern lightweight be trusted not to crystallise within ten thousand miles? I knew of several rigid single blade forks, dated about 1903 or thereabouts, which crystallised and fractured in less than that distance; but one presumes that the addition of springs should at least double the margin of safety.

GRINDON, Littonslack, Cowdale, and other of the test hills in the memorable A.C.U. Six Days Trials of 1914 seem to have left a lasting impression upon those who took part in the event, consequently one or two enterprising trade representatives at once seized upon a suggestion of ours that they should test their new designs on a few of the more severe hills. The demonstration of hill-climbing ability was to be more in the nature of an exhibition of the advance made in gear construction, seeing that among the small party was one of the 1915 Lea-Francis three-speed machines ridden by Norman Lea, and a four-speed Campion sidecar owned by George Hunt. Others in the party were W. H. Carson on a 5-6 h.p. Excelsior three-speed sidecar—the forerunner of the 1915 model fitted with one of the latest design Druid forks permitting longitudinal and vertical movement, and J. Drew on a 2½ h.p. New Imperial-Jap with Albion three-speed gear.

A Well-appointed Sidecar.

The Peak District is readily accessible from the Midlands, and the arranged meeting point was the Royal Hotel, Derby. We made the journey thither comfortably accommodated in W. H. Carson's Millford sidecar—a more luxuriously sprung vehicle one could hardly imagine. It has a hood and screen, too, besides a Thomson-Bennett foot warmer connected to the exhaust. Norman Lea accompanied us, and he had been working like a brick until the wee sma' hours to get a 3½ h.p. machine finished with the new three-speed gear. It took less than two hours for a non-stop trip of forty-four miles from Coventry to Derby, where we found our photographer and his 8 h.p. Matchless all ready for the fray, but after a wearisome wait the other members of the party had to be left to follow our tracks if possible, as we had arranged beforehand to stay the night at Buxton. So, in company with Carson and Lea, we pushed on to Grindon *via* Asbourne and Ilam, and in looking for the "terror" that stopped quite 80% of the competitors in the Six Days encountered in Wetton a farmer whom we asked for the shortest route, but the farmer with a broad smile said he couldn't send us the shortest way, and told us a roundabout route. Asked why we could not go the shortest route, he said that the road was too terrible. We finally discovered that his fear was the descent of the very hill we had come out to climb. Off we went, and in descending at a crawl with the wheels occasionally locked had time to study the nature of the hill. The top portion of Grindon is merely a grass-grown track, but, as one descends the steepest stretch on a cliff side, the surface is composed of soft gravel and loose stones which afford no grip for tyres in wet weather, and this fact accounted for so many failures in the Trials. On the day of our visit the surface was slightly improved, and only just moist from recent rains.

Successful Ascents of Grindon Hill.

Starting from the bridge, the Excelsior led off with three aboard, and had soon successfully accounted for the climb, the middle gear being brought into operation on the grassy slopes. It was now the turn of the Lea-Francis, and this machine, too, made the ascent look surprisingly easy, so much so that all present were constrained to wonder why it was that there was such an outcry against the inclusion of the hill in the trials. Of course, on narrow lanes such as Grindon baulking is prevalent, and probably the most bitter complaints were due to stranded competitors hindering others during the climb. To return to Norman Lea's ascent, this rider was actually able to use the middle gear between the bends, or, in other words, the lowest gear was used only on the abrupt corners owing to a fast rate of speed being impossible. Thus one realises how the three-speed mount scores over the two-speeder, not only in speed on hills, but also in fuel economy, lack of valve troubles due to slower engine speeds, and general comfort of riding.

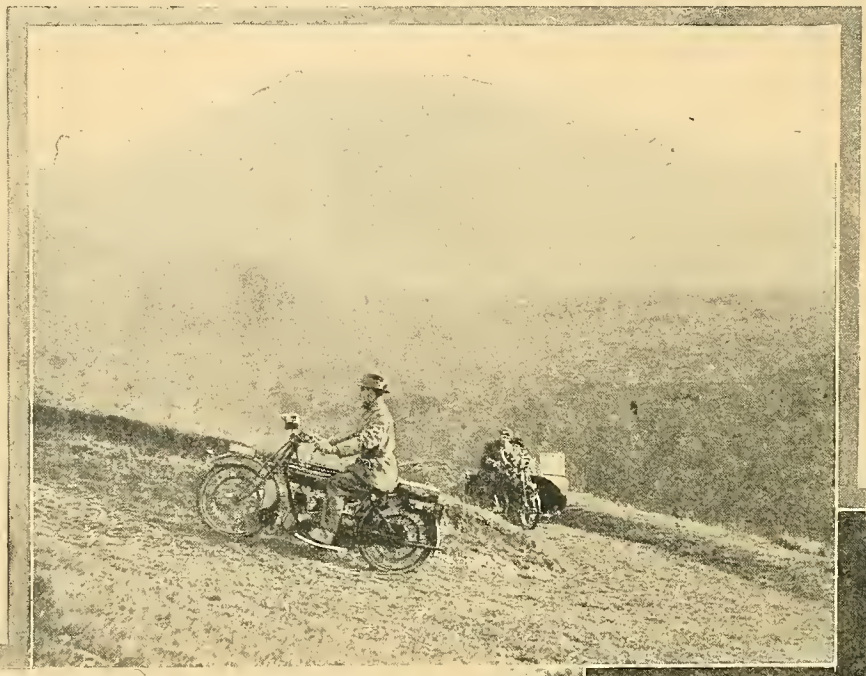
Testing 1915 Models.—

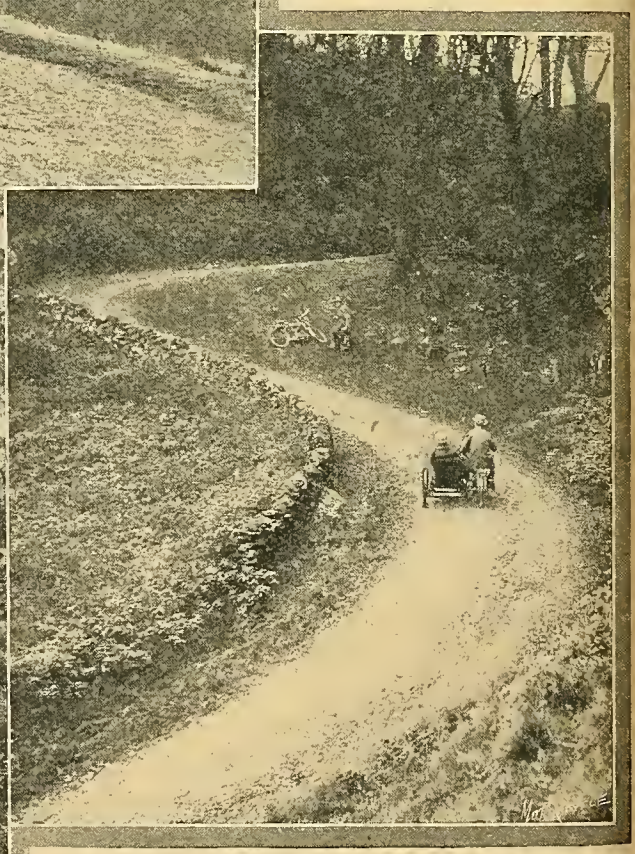
The corresponding ascent from the dale toward Leek is a much easier proposition, and both machines got up on middle gear, except for the corner. We now struck out for the main road to Longnor and Buxton, and among the intricate lanes of this neighbourhood encountered several "knucklesome" stretches. At Longnor we fed the inner man, and trickled into Buxton at lamp lighting time, finding the other members of the party, Hunt and Drew, at the Grove Hotel.

The Terrors of Cowdale Vanquished.

On the morrow we made for Cowdale, a once difficult climb, but, like other noted hills, apparently becoming flatter and flatter on each successive visit. At any rate it troubled none of the four motor cyclists in the party, and before leaving the hill Lea made a successful attempt to climb it on the second gear. To enable this to be done, however, his speed on the corners was faster than anyone except such an expert rider as Lea would care to attempt.

Our next move was along the exceedingly picturesque road to Millers Dale, rendered more beautiful in this instance by the autumn tints on the trees, where the lower road to Litton Mills was followed. Littonslack was in very good condition, with only a little dampness noticeable





(Top) The second bend on Grindon Hill, showing Norman Lea (3½ h.p. three-speed Lea-Francis) and W. H. Carson (Excelsior sidecar)

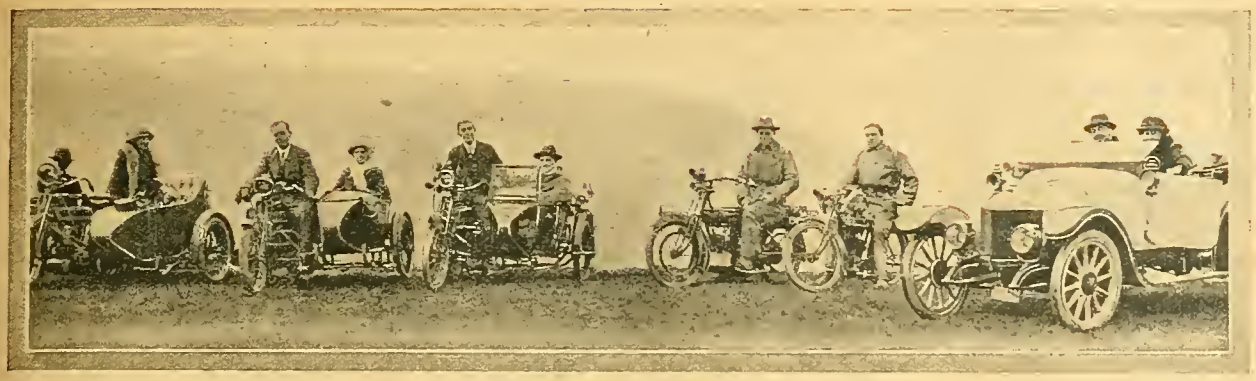
(Right) G. Hunt (8 h.p. Campion with Jardine four-speed gear ascending Cowdale Hill



The hill-climbing party at Monsal Head.

on the grass-covered slopes. This time it was not such a "walk-over" for the party, though the Lea-Francis led off with two ascents in quick succession. Carson followed on his heavy coach-built sidecar outfit with suit cases and petrol tin at the rear, but met his Waterloo fifty yards from the top with the driving wheel churning up a deep trough on the 1 in 4 section. It would, indeed, be a wonder if an Excelsior stopped owing to lack of power. While some of the superfluous weight was being removed the writer tried the L.-F., but came to a standstill near the top owing to a piece of scale choking the jet. This cleared, the ascent was proved to be almost child's play to one mounted on such a machine, though, of course, the stony surface bucketed the machine about. George Hunt followed on his four-speed Campion, but he suffered the same fate as Carson. Twice, however, he managed to restart on the clutch what time two strong men held the machine from running backwards, and thus made the ascent in stages. Descending Litton is really exciting work, for even locking the wheels does not prevent the machine slithering down the precipitous gradient. There is a stone wall at the foot waiting the rider who allows his machine to get out of hand.

A Lightweight Rider's Success.

Drew made a very plucky attempt to get up on the little New Imperial, and although success was not his at the first try, he finally got over the top very comfortably, which shows the wonderful capabilities of the modern lightweight. Carson now came along again, and at the first sign of wheel-slip his passenger clambered on to the carrier, and in this wise the big single Excelsior added to its laurels as a hill-climber. Not satisfied, however, he made another clean ascent. Meanwhile Lea gave a remarkable exhibition of clutch manipulation by twice restarting from a standstill on the steepest portion, said to be 1 in 3·3.

The pluck of George Hunt was rewarded, for after tightening up the clutch he made a good ascent on his four-speed mount and could have gone on climbing all day had not his machine been equipped with an all rubber driving tyre. Among the spectators was Mr. Watchorn, works manager of the Jardine Co., who felt sure that a hill he knew at Congreave, near Haddon Hall, was steeper than Litton, so to satisfy the party that nothing was too much for them a move was made for the village named, the hill at Monsal Dale being ascended on the way. Congreave Hill, though steep, slippery, and winding, was no match for the machines, the two soloists continuing up a quarry road with boulders projecting which ninety-nine out of a hundred persons would unhesitatingly deem unrideable. Yokels interested in the performance pointed out still another hill on the opposite bank known as Picture Hill, but their opinions of its severity were not upheld when the party at-

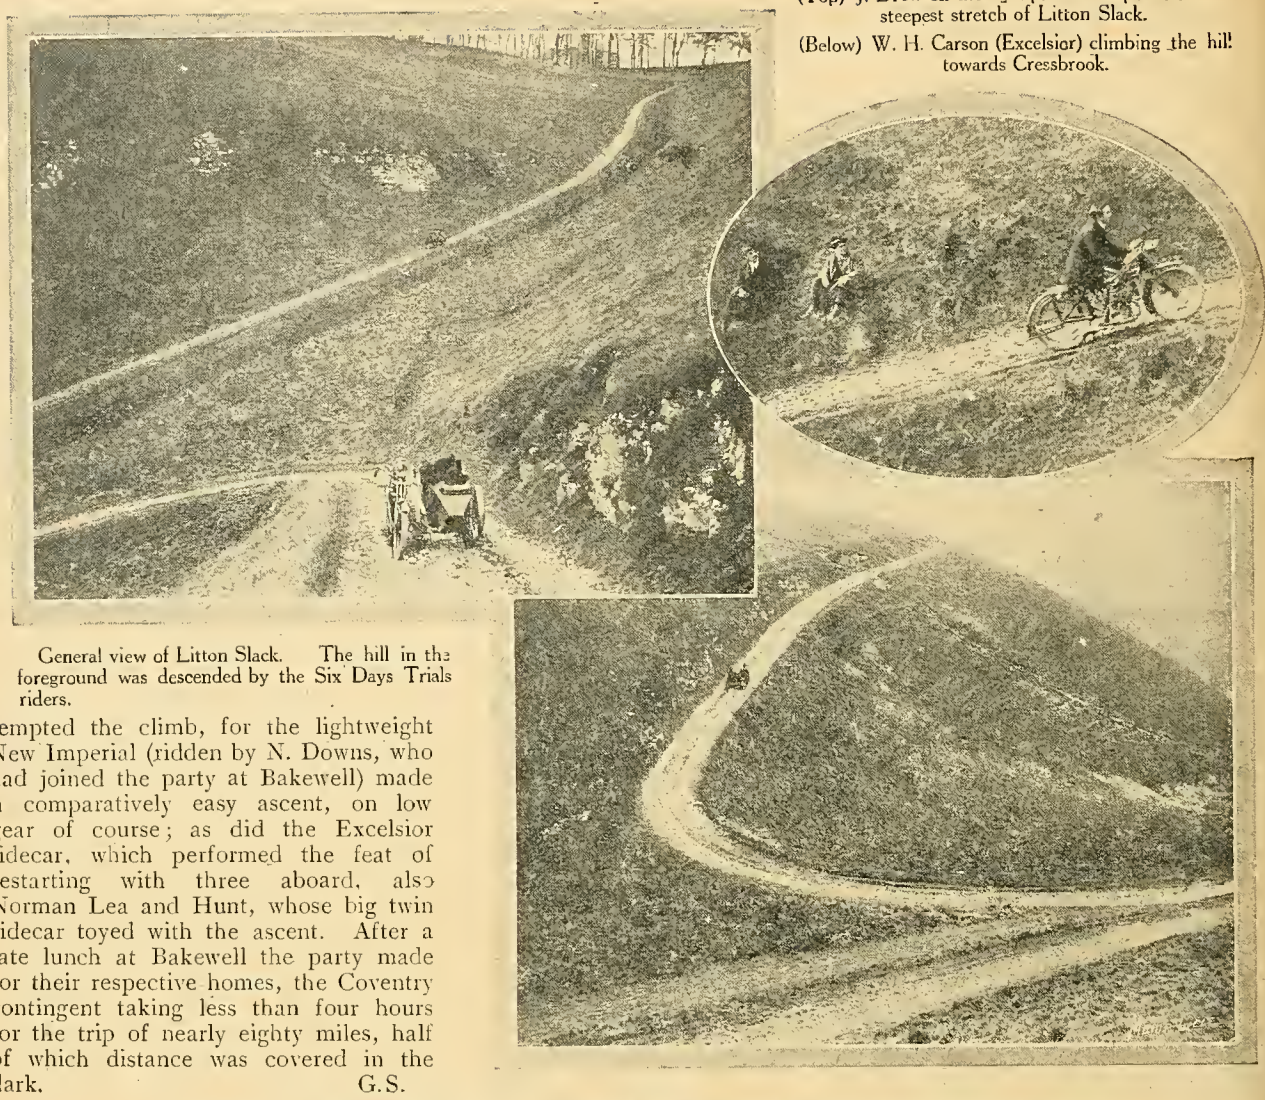
(Below) W. H. Carson (Excelsior) climbing the hill towards Cressbrook.



General view of Litton Slack. The hill in the foreground was descended by the Six Days Trials riders.

tempted the climb, for the lightweight New Imperial (ridden by N. Downs, who had joined the party at Bakewell) made a comparatively easy ascent, on low gear of course; as did the Excelsior sidecar, which performed the feat of restarting with three aboard, also Norman Lea and Hunt, whose big twin sidecar toyed with the ascent. After a late lunch at Bakewell the party made for their respective homes, the Coventry contingent taking less than four hours for the trip of nearly eighty miles, half of which distance was covered in the dark. G.S.

Aero Engines and the Motor Cycle.

AT first sight there does not seem to be any very great similarity between a six-cylinder water-cooled aero engine and a motor cycle engine, and yet the success of the Green Engine Co., Ltd., in carrying off the Government £5,000 prize for the engine with "the greatest percentage of attributes desirable in an aeroplane engine" tempts us to point out some interesting features which the Green motor cycle engine shares in common with its larger brother. We are accustomed to connect the Green motor cycle engine with pannier honeycomb radiators, though a model described in our issue of August 20th, page 248, is constructed with cylinders almost identical with those of the aero engine except in size. In each case the cylinder casting is surrounded by a copper jacket fixed at the top to valve case extensions, and making a watertight joint at the base by means of a square section rubber ring.

The overhead valves are carried in separate cast iron boxes, and may be removed complete by swinging back the operating gear and undoing a single locking nut. The valve heads lie partly in recesses in the cylinder head, and as the guide is extended very far down over an increased diameter of stem, it is to all intents and purposes impossible for a valve to fall into the cylinder in case of breakage; for, unless the stem were to break off close up to the head, where the strength in this design is greatest, the combination of the long guide and cylinder recess would still hold the fractured parts.

The 100 h.p. Green aero engine, which has just added this fresh success to the already long list, is a six-cylinder engine of 140×152 mm. bore and stroke, with the cylinders set in line and slightly *désaxé* to the crankshaft. The valves are operated by an overhead camshaft, and are very accessible. Forced lubrication is employed throughout, and a large bearing lies between each crank throw. Unlike the motor cycle engine, the aero engine has been designed to pull its maximum power at low speeds, as a propeller seldom revolves at 1,100 revs. In spite of its size the engine weighs only 442 lb. Would that our motor cycle engines weighed as little in proportion! The absence of flywheel in aero engines is, of course, responsible for a large part of the difference.

WANTED: EXPERIENCED MOTOR CYCLISTS.

The A.C.U. (Liverpool Centre) wants twenty-eight experienced motor cyclists with or without machines. Ages 19 to 30. Period three years, or duration of the war. The men will be promoted to corporals the day after enlistment. Pay as corporals, 2s. 6d. *per diem*, to which, after training, engineer's extra pay of 6d. a day will be added. Riders must apply personally to Mr. S. W. Phillpott, 60, Lime Street, Liverpool, bringing machines on which their riding abilities can be tested.

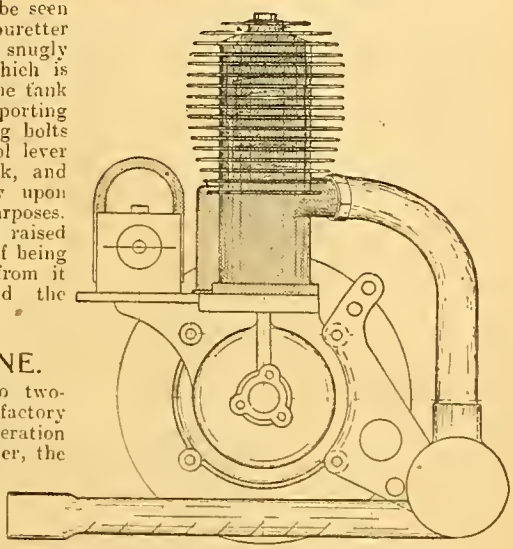
LATEST DESIGNS.

Advance Descriptions and Illustrations of 1915 Model Motor Cycles and Accessories.

NEW 5 h.p. QUADRANT.

THE most notable alteration to the new design Quadrant is the fitting of the B.S.A. counter-shaft three-speed gear combined with kick starter. This gear is controlled by a lever, which is attached to the bottom tube on the right-hand side of the tank, and the clutch is operated by the right foot. The drive is by means of an enclosed chain from the engine to the counter-shaft, thence by belt over a large pulley on the left, while on the right is a dummy belt rim in the V of which works the rear brake. All-chain transmission may be obtained to order. The frame has been lengthened to accommodate the gear, the Quadrant spring forks are retained, and the rear stays and forks made detachable. The engine is rated at 5 h.p., and external cams are used, a separate timing wheel being used for the operation of each valve. The inlet valve timing wheel drives direct on to the magneto wheel.

An excellent point is the provision of a split rear spindle to enable easy withdrawal of the back wheel so that a tube may be readily replaced. As will be seen in the illustration a Senspray carburetter is fitted, and the magneto is very snugly housed behind the crank case, which is most distinctive in appearance. The tank is supplied with special liners supporting it on all sides, to which the fixing bolts are attached. The magneto control lever is placed on the left of the tank, and the makers have decided to rely upon the hand pump for lubrication purposes. The footboards are of aluminium, raised in front. The inlet valve, instead of being beside the exhaust, is separated from it by about 90°, and lies behind the cylinder.



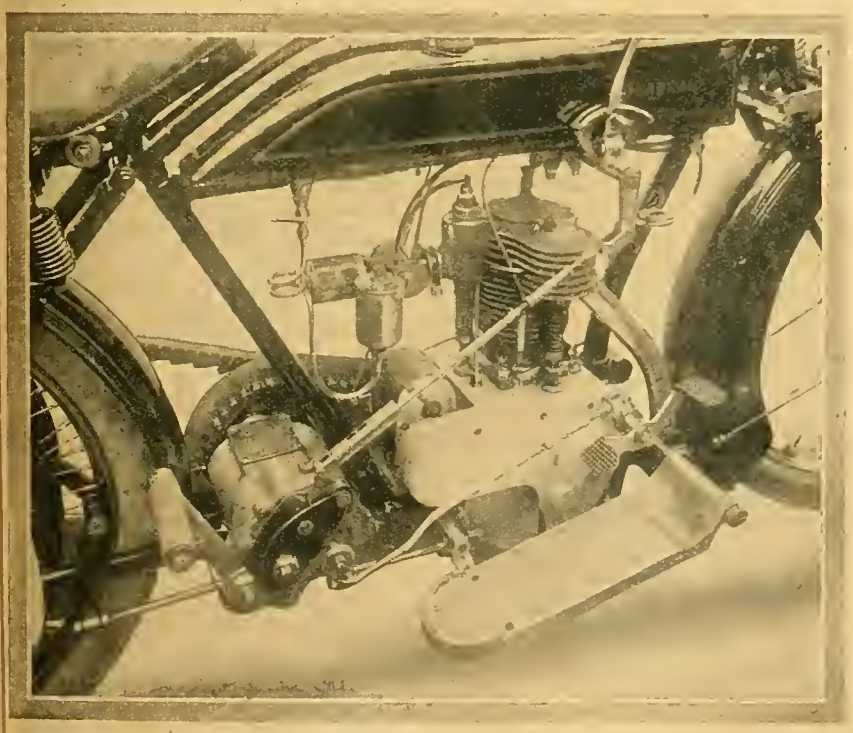
Latest design 2¼ h.p. Peco engine of 210 c.c.

A NEW PECO ENGINE.

AS the present 2¾ h.p. Peco two-stroke has proved so satisfactory there is no reason for alteration for the 1915 season. However, the large demand for a somewhat smaller power plant has induced the firm to construct an engine of 62×69½ mm. bore and stroke, which is rated at 2¼ h.p., and has a cubic capacity of 210 c.c.

Almost every feature of the larger engine is reproduced in the new type. To begin with, an improved type of Hoffmann roller big end is used which is considerably narrower over all, in spite of the fact that the roller surface remains as before. This permits of a narrower crank case and consequently higher crank case compression, so that it has been found that the double or false top to the piston, which is so noticeable a feature of the larger engine, can be dispensed with. The small engine also has a plain piston trunk with two pegged rings at the top, and plain mainshaft bearings are employed instead of rollers. The patented lubrication system is, of course, retained, the oil being led to a ring surrounding the cylinder and passing through holes to the piston, then the surplus is caught by a well below the base of the piston and conducted by separate leads to each main crankshaft bearing. The new engine is neat and light, and can be supplied for either belt or chain drive; in the latter case a dished flywheel can be fitted which allows the sprocket to be mounted on the outside instead of between the engine and flywheel; consequently chain guarding is rendered a much simpler problem, and the chain is more accessible.

Plain piston of the new 2¼ h.p. Peco.



Power unit and three-speed gear box of the new 5 h.p. Quadrant.

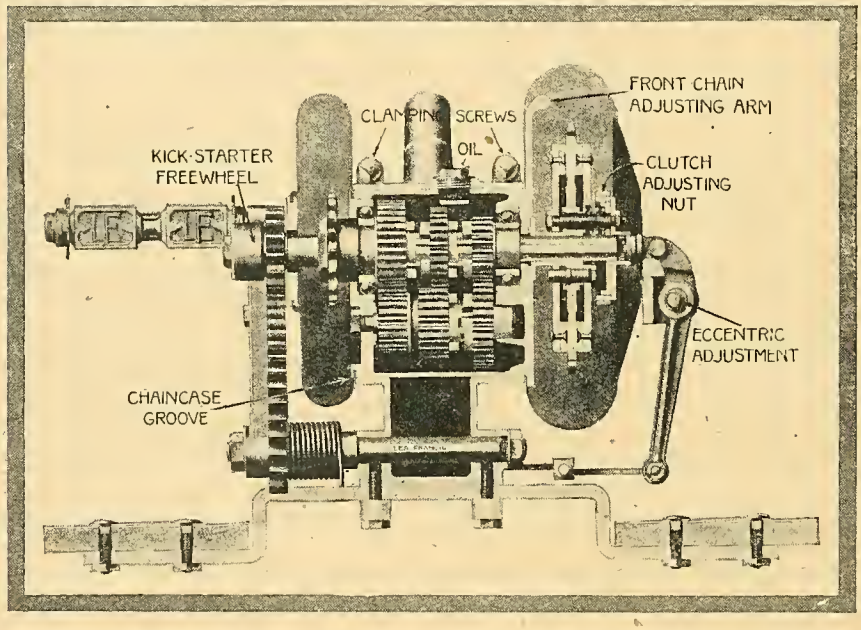
A Lea-Francis Three-speed Gear.

NEW FITTING FOR 1915, INCORPORATED IN ORIGINAL GEAR BOX.

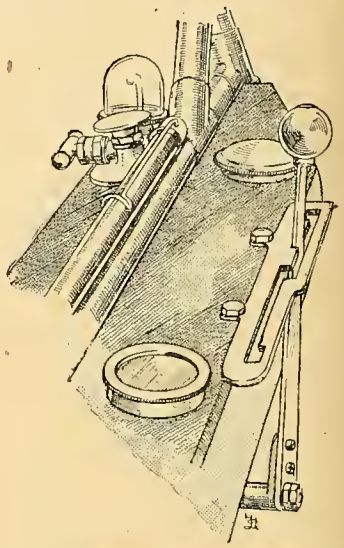
THE 1915 model of the Lea-Francis will be equipped with a three-speed gear. Ever since their first public appearance the Lea-Francis machines have attracted a large amount of attention, not only on account of their fine performances in reliability trials, but also because of their excellence in general design, and particularly detail work. Up to date, the modifications which have been carried out have been comparatively unimportant, but we are now able to describe and illustrate the latest type of gear giving three ratios, which will be a standard fitting in the near future. The gear has been thoroughly tested on the road, and has been proved to be perfectly satisfactory after prolonged trials, so that it is not by any means a new device to rods. These rods are held in position by a plate fixed to the stationary bracket, and formed with a groove for each control rod. In this manner the horizontal movement of the cam plates transmits vertical motion only to the control rods, as can be seen from the appended sketch. The whole selector mechanism is well out of the way of grit and mud, and is as fool-proof as possible.

Gears Always in Mesh.

There are three sets of dog clutches in the gear box—two on the main shaft and one on the layshaft, and the gears are always in mesh. Thus every change is made by means of dog clutches, and, consequently, a very much finer pitch can be used. In point of fact, 16 pitch teeth

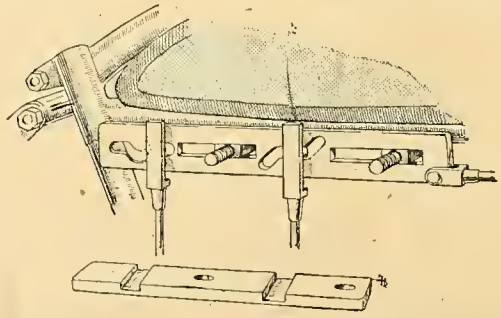


Sectional drawing of the three-speed Lea-Francis gear to be fitted to all future models.



The quadrant and striking gear.

he tried at the expense of the public. Outwardly, the appearance is but little altered, for the new gear is contained in the same shell as before, and is mounted in the same type of bottom bracket lug. The control is, of course, somewhat different, and though the lever and quadrant are on the usual L.F. lines, with an extra notch for the additional ratio, the selecting mechanism is somewhat unusual. Attached to the lower tank tube close to the seat post is a fixed bracket with two extension pieces, which pass through a sliding cam plate, the movement of which is controlled by the change speed lever. The plate slides in a staight line, horizontally only, and is formed with two specially shaped cam slots, into each of which a roller projects from the two vertical striking



Cam selector plate of the new three-speed Lea-Francis.

are employed throughout, which renders the drive very quiet.

The main driving shaft is splined, and extends right through the box, driving only the centre wheel. When this central wheel is moved to the left (away from the clutch) top gear is engaged, and a similar movement to the right brings the low ratio into action. Middle is obtained by centralising the main shaft dogs and engaging the pair on the layshaft. The layshaft is a steel pin fixed in the gear box on which the driven wheels revolve, carrying with them two phosphor bronze bushes.

Besides the alterations to the gear, the clutch has been modified, with beneficial results. In the latest type the sprocket member is gripped between two material faced plates, and it is found that the new clutch will stand indefinite slipping, and yet grip firmly when home.

We have tried this gear on the road, and it behaved just as one would expect any L.F. production to do. It changed easily up or down, the gears were silent, and the speed and general comfort of the machine on the high gear were most pronounced.

Engine vibration on the top gear of 4.75 to 1 is practically non-existent. Quite a good speed can be attained on the middle gear of 6.9 to 1, whilst the 12.3 to 1 low gear ensures an ascent of any rideable hill, and, moreover, renders the 1915 L.F. a very attractive proposition for sidecar work.

An account of the performance of this new gear on severe hills included in the A.C.U. Six Days Trials will be found in another article in this issue.

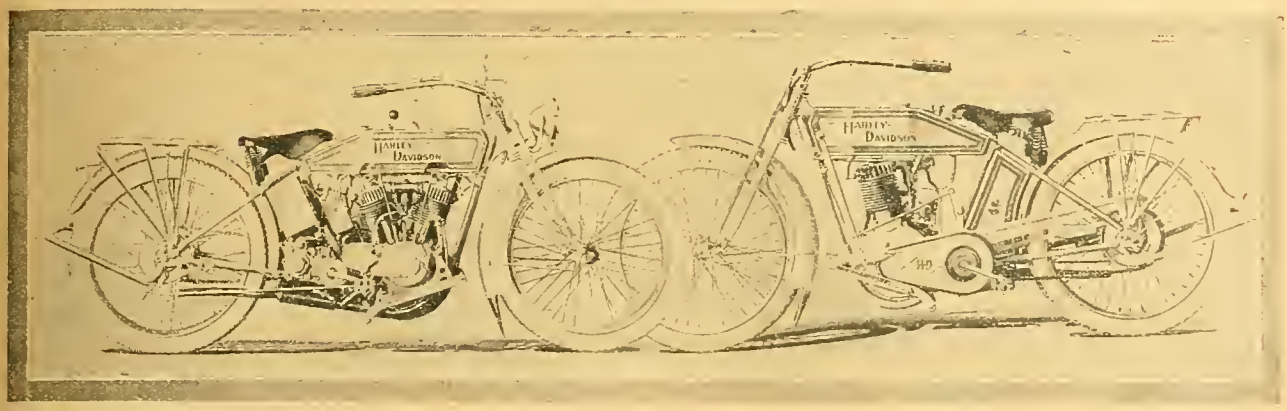
New Harley-Davidson Models.

Three-speed Countershaft Gear. Chain Drive. Mechanical Lubrication.



The new 11 h.p. twin-cylinder three-speed Harley-Davidson with Remy system of electric lighting and ignition.

The 1915 model 6 h.p. single-cylinder Harley-Davidson

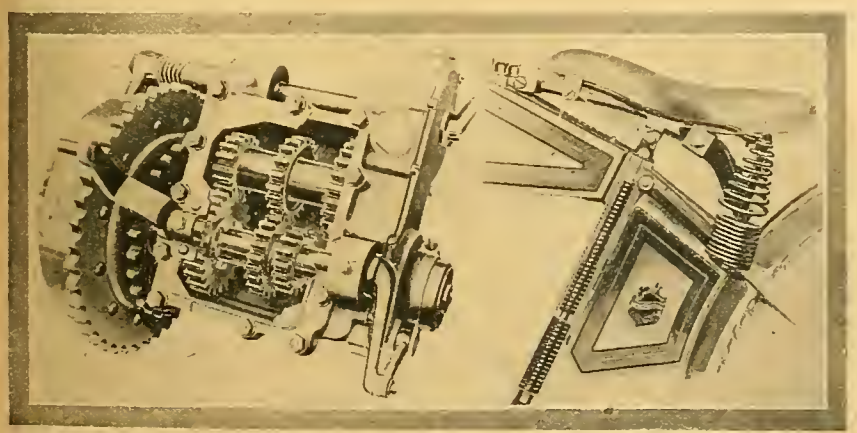
ONE of the finest American productions in the motor cycle line, and one which has already made its appearance in this country, is the Harley-Davidson. Two models of engine are made, a twin of 989 c.c., rated at 11 h.p., and a single of 567 c.c., rated at 6 h.p. These engines are fitted to machines having single gears, two-speed hubs, or three-speed countershaft gears, but the twin three-speed model may be taken as an example which includes nearly all the firm's specialities.

The motor is of the V type, having a bore and stroke of 84.1 × 88.9 mm. respectively. The inlet valve is placed over the exhaust, and the exhaust valve springs are neatly enclosed in tubular sleeves. The valve chests and ports have been re-designed for the 1915 models, and, in conjunction with other improvements, the power of the engine has been considerably increased; in fact, we are told that the standard engines pull well over 16 h.p. The magneto is placed behind the engine and driven by a train of gears, one wheel of this train being utilised to drive an oil distribution pump, which is cleverly arranged, and, though of the plunger type, has no ball valves.

The unit is carried in a strongly reinforced loop frame, a type common in the States, and has stout spring forks with enclosed springs. Twist grip controls are fitted, and the large saddle is mounted on the Harley-Davidson "Ful-Floteing" or spring saddle pin. Besides this a substantial luggage carrier is supplied, a refinement by no means universal on American machines. The three-speed gear is a fine piece of work. It has one sliding member only, but unlike most British gears only one pair of dogs is used, the middle and low gears both being engaged by sliding pinions. The clutch is of the dry plate type, and chain drive is employed throughout. With the gear is incorporated a kick starter, which automatically comes out of gear in case of a back fire. Incidentally, the gears cannot be moved without declutching. The latest type of machine embodies an electric lighting outfit. The Remy system of combined magneto and generator is used, and has many advantages, such, for instance, as the facts that the engine may be started and lamps lit, even if the accumulator be discharged. The head lamp has two bulbs, one for traffic driving, and one, more powerful, for country work, and a very simple switch is employed.

A very large and powerful expanding brake is a feature of this machine, while the foot-boards are both neat and comfortable. Messrs. Harley-Davidson tell us that they make a close study of British machines, and are constant readers of *The Motor Cycle*.

Oil pump which, it is claimed, will positively feed oil against a pressure of 70 lb., although crank case pressure never exceeds 4 lb.



(Left) The Harley-Davidson gear box partially cut away to show the three-speed gears.
(Right) The spring seat-pillar.

ROYAL RUBYS IN 1915.

The 1915 model Royal Ruby lightweight will be similar in specification to the 1914 model excepting that it will be fitted with separate lubrication and magneto control from lever on tank and Mosceley's motor-cyclette 26 × 2in. B.E. rubber studded tyres, also new pattern footrests. A lady's model lightweight with open frame is to be marketed in 1915.

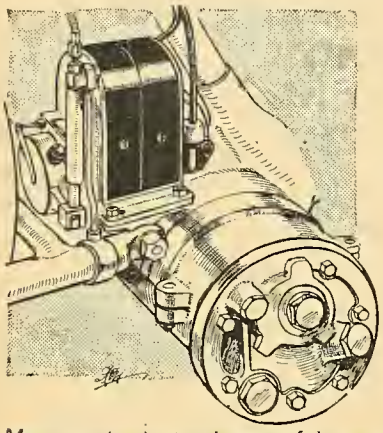
TWO-STROKE RADCOS.

The Radco Company have decided upon a number of alterations to their ladies' two-stroke motor bicycle which should render the machine a very practical mount by reason of its light weight and flexible engine. On the 1914 model the frame was not sufficiently "open" to suit ladies' ideals, but this matter is receiving special attention on the new model, and a registered design of dress-guard has been standardised.

The 1915 Matchless Racing Model.

M.A.G. Engine—Three-speed Counter-shaft Gear—Chain Drive Throughout.

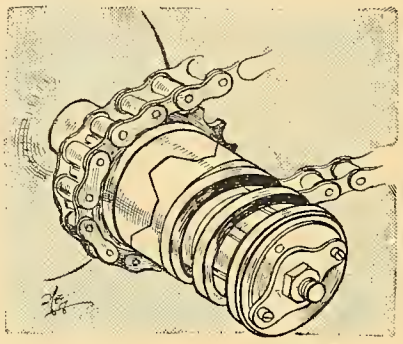
THERE are no men in the motor cycle business who have had greater experience in the use and construction of racing motor cycles than Messrs. H. A. and C. R. Collier. From the very earliest days of the movement we used to watch with interest the wonderful performances of these intrepid riders on Canning Town track, which was only banked for 40 m.p.h., but even in those early days they used easily to exceed the limit of speed on carefully built and well tuned 2¾ h.p.



Magneto on bracket forming part of the gear box casting, showing slotted holes.

racing machines. It is not surprising, therefore, to note that the 1915 3½ h.p. Matchless racer is a beautiful piece of design, capable of obtaining the highest possible speeds, and of standing up under the most strenuous tests. The machine we are about to describe was primarily built for the 1915 Tourist Trophy.

The 3½ h.p. engine, 496 c.c., 64 mm. × 77 mm., remains practically unaltered; it is an exquisite piece of work and beautifully finished. The most important improvements on the machine are the introduction of chain transmission and the fitting of a three-speed counter-shaft gear



New shock absorber.

box, which contains gears of the sliding type.

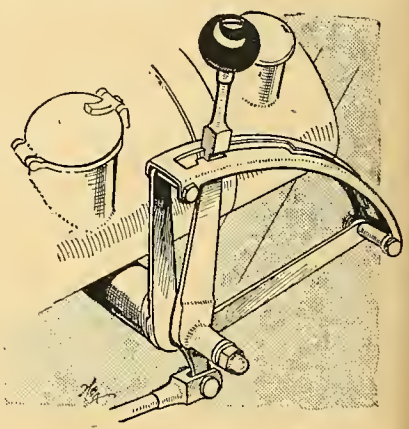
The magneto bracket forms part of the gear box casting, and the bolts holding the magneto on to the bracket pass through slotted holes so that in the event of it being necessary to take down the engine the magneto can be slid backwards, the tailshaft dropped out, and the engine removed without further disturbing the magneto. The magneto itself is in an ideal position, and is well out of the way of mud and wet.

The Transmission.

Reverting to the gear box, it is interesting to note that if the end plate be removed the gear ratios may be changed by removing the layshaft and loose pinion and replacing them, and arrangements have been made to supply three separate sets of gear ratios, which are as follow: 3½, 4½, and 5½ to 1, and two sets in which the third and second speeds remain the same, but in which the low speeds are 6¼ and 7½ to 1 respectively.

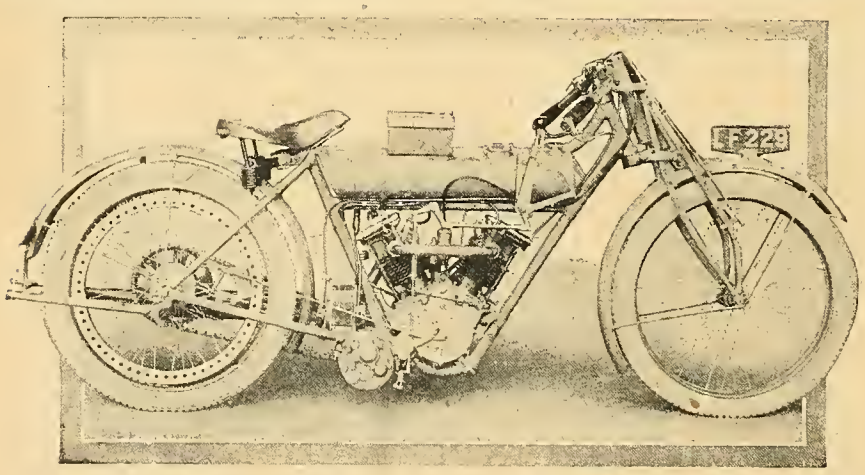
As regards the chain transmission, an ingenious and effective form of shock absorber is fitted to the engine-shaft. The nature of this may be clearly seen from the accompanying sketch. It will be obvious that the sprocket is engaged with the extension of the engine-shaft by means of inclined planes which slide on a feather solidly attached to the shaft. These planes are kept in engagement by means of a strong spring, but on the engine accelerating there is a tendency for the sprocket to force the sleeve on which the inclined planes are cut backwards and so give just the right amount of slip to absorb all sudden stresses on the chains. The bolt at the end of the mechanism acts as a grease cup, and if grease be injected it lubricates the device adequately for a season's running. A further shock absorber is fitted to the back sprocket which takes the form of a rubber cushioned drive, with the result that the transmission in the racing Matchless should be as elastic as if a belt were fitted.

The general view of the machine shows the well designed silencer and the easy sweep of the exhaust pipes, which tend



Change-speed gate on the racing Matchless.

to conduct away the gases with the minimum amount of back pressure. The whole machine is finished in khaki, a serviceable and businesslike colour, even to the back hub. The gear box, we may mention, is practically the same as that fitted to the sidecar combination with the exception that no kick starter is provided. When the time comes to put the racing Matchless to the test we do not hesitate to say that we think it will give an excellent account of itself.



The 1915 racing Matchless, which has a three-speed counter-shaft gear.

TO COMPLY WITH THE NEW REGULATIONS.

One advantage of the new Low generator, to which attention has not been previously called, is that it will allow the flame at the burner to be turned down. This is a most important point, now that the lighting of even motor cycles has to be reduced before they are allowed to enter the Metropolis. As the gas is quite pure, there is no fear of carbonisation with a reduced flame. Last week we heard of cases in which the police actually whitewashed the lamp glasses of motor cycle head lights before their owners were allowed to proceed into town.

MOTOR CYCLING ON GIBRALTAR ROCK.

WE publish below a letter received from Private G. T. Gray, who is well known to our readers as a leading competitor in the different trials, and a regular Scottish Trials participant. Gray is now stationed at Gibraltar with the "C" Company of the 7th Middlesex Regiment. *The Motor Cycle* regularly finds its way out to Gibraltar, even in war time, for Gray writes:

"I have read with interest the experiences of several of my fellow competitors on active service, and thought it might interest you to hear what another of us is doing.

"I joined the 7th Middlesex (Territorials) on August 24th, and proceeded to Sittingbourne on my Rudge. After ten days we sailed on a troopship for the Rock, and arrived after five days' exceptionally smooth passage. I expect the general impression is that a motor cycle in Gibraltar would not be of much use, but such is not the case. There are about ten miles of quite decent roads—hilly, of course, but well graded—and as I am the only motor cyclist in the regiment I am kept busy. The work is not exciting, but this great rock is full of interest, and my work despatch carrying has enabled me to see more of it in a few weeks than would have been possible without the machine. My usual round is to the various companies located at different points, and the distances are, of course, short, the rock being only three miles long and threequarters of a mile wide. It is, therefore, a case of being at my destination almost as soon as I am in the saddle, so that riding consists chiefly in stopping and starting, and it is very necessary to have a machine which is always ready to start at the first push. In this and in every other way my T.T. Rudge is proving a good friend, and never seems any the worse for the awful knocking about it is getting and the many thousands of miles of competition work it went through this season. I am enclosing a photograph, which will show you the light drill uniform and sun helmet being used here."

Private G. T. Gray (Rudge Multi), who is stationed at Gibraltar.

AN AMBULANCE COLUMN.

The Special Ambulance Column, comprising thirty to forty motor cars, and which has been presented to the British Government by Mr. Arthur du Cros, M.P., is now on its way to the fighting line, and is accompanied by ten Ariel counter-shaft three-speed motor bicycles which have been specially completed for this work. The column is under the command of Captain George du Cros and Lieutenant Willie du Cros.

LETTERS FROM DESPATCH RIDERS.

The following are some extracts from letters received from well-known riders at the Front, the first two being addressed to Mr. Victor Holroyd, who kindly sent them on to us:

From S. A. ROWLANDSON, 69 Company, Mechanical Transport, A.S.C.:

"I went to Le Mans on Sunday last, and whilst there collected the two Rudges—a Multi and a fixed gear model—which Pullin and I left for the Grand Prix on July 25th. Up to now Noble and I have ridden these. They are both going well, and will be extremely useful. The captain is glad to get hold of motor cycles, and there is some talk of making me a motor cyclist scout, but it is not yet fixed.

"In 69 Company we now have two Rudges, two Douglases, and six Triumphs. I have met Frank Begley and one or two other despatch riders lately. We get no real news of what actually takes place at the Front."

From VERNON TAYLOR, driver of a Red Cross van:

"I have got a big Talbot van attached to the Red Cross, at present at Chateau d'Annel, a fine old fourteenth century place belonging to an American multi-millionaire called D——, who has turned ball room, music room, and study into a hospital of eighty beds. It is a lovely old place of about sixty bedrooms, and stands in a park of 1,000 acres. Germans have been here (we all scooted, of course,

Panoramic view of Gibraltar Rock from the harbour.

Military Motor Cycling Notes—

about half an hour before), but didn't do any damage on account of American flag. They only took about 1,000 bottles of fizz; all the other stuff, silver plate and china, we have buried in the park. There are six of us with cars, a whole battalion of nurses, supers, etc. D—— is a topping chap and treats us like lords. I have gone some trips to Bordeaux, Nantes, Angiers, Le Mans (an old circuit), any amount of runs to all parts of coast, and generally get into Paris about twice a week. The firing line is about four or five miles from here, and the din is awful from the guns. There was a big battle last night, and we got about twenty in to-day and are pretty full; it is awful to see them coming in, some half blown to bits. A Zeppelin came over two days ago, and every day we see German 'planes."

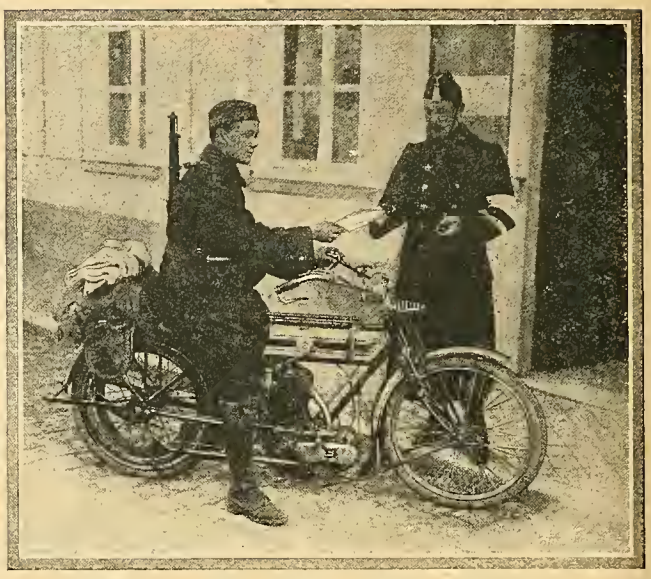
From Corporal A. J. Sproston, Second Signal Company, Second Division Royal Engineers Expeditionary Force:

"The motor cycle has come into its own and has proved invaluable, doing good work under severest conditions. The weather is ideal for the job. We had a very trying time going up country and then back again, but we are doing all right, and for some time have been giving it to them hot; they do not get much peace from us now. The A.C.U. Six Days Trials conditions prepared some of us for awful conditions; muddy and bad roads, dropping into shell holes, and getting over pontoon bridges, etc. We have to thank the trials for the improvement in the machines, that are now able to do the work.

"I started off with a Rudge, and now have a Douglas—both good. You no doubt look anxiously for news of the great battle (Aisne). I am up in the front and I think we are doing well and have everything in our favour. The French are doing well also. I hear there will be no Shows this year; I was looking forward to these. We have been very lucky and have had many narrow shaves, of course; one or two motor cyclists have been killed and a few injured. We have tons of supplies and plenty of motor lorries."

[In another part of this issue another reference is made to this gallant rider. It is hardly surprising that the man who finished the T.T. with a broken ankle should be mentioned in despatches. It may be remembered that the late Prince Francis of Teck specially congratulated him on his extraordinary pluck on the occasion of the A.C.U. dinner after the event.]

Corporal A. J. Sproston, who has been mentioned in despatches He is seen handing a despatch to a French cuirassier.



IN THE FIGHTING LINE.

A Belgian despatch rider handing in despatches at ———. It will be observed that the machine is a three-speed Triumph.

One of the conditions of the Russian Government order was the provision of a handbook, printed in Russian, giving instructions in the care and handling of the motor cycle ordered. We have received from the Rover Co., Ltd., of Coventry, a copy of its handbook, and, judging by the clearness of the illustrations only, no difficulty should be experienced in the handling of the 350 Rovers sent out for the Russian Army.

We have also received a specimen copy of the Enfield booklet, describing in detail the working and adjustment of the 6 h.p. twin-cylinder model Enfield, which should be of great service to the Russian Army motor cyclists.

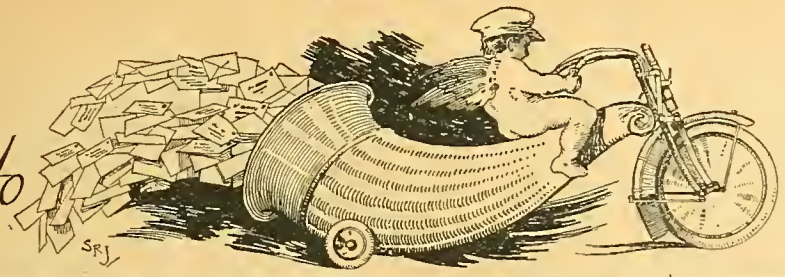
LONDON MOTOR CYCLIST RESERVE COMMITTEE.

We are informed that the headquarters of the London Motor Cyclist Reserve Committee has been transferred from Fulham House, Putney, where the work was carried out under the direction of Lieut. H. B. C. Pollard, 25th Middlesex (County of London Regiment), to the offices of the A.C.U. Therefore, all motor cyclists in the London district who are desirous of enlisting in the Royal Engineers Special Motor Cyclist Reserve, which will probably entail active service, or those desirous of enlisting for Home service, should apply in person to Mr. H. P. Beasley, Inspecting Officer, London Motor Cyclist Reserve Committee, c/o The Auto Cycle Union, 83, Pall Mall, London, S.W.

Only motor cyclists of considerable experience, and able to do their own running roadside repairs, will be accepted, and those able to speak French will be given the preference. It is not essential that a suitable applicant should possess a machine, as he will, if accepted, be supplied with a Government motor bicycle.

Applicants possessing one of the following seven makes of motor bicycles may present them for examination for valuation purposes (an allowance being made by the Government upon taking over the machine if suitable): Triumph, Douglas, Rover, B.S.A., P. and M., Rudge, and James (single-cylinder).

We are informed by Mr. Beasley that the demand for competent motor cyclists is fairly heavy. Upon enrolment, motor cyclists will rank as lance corporals in the Royal Engineers, and receive 1s. 2d. per day pay, and these men should stand an excellent chance of proceeding on active service. Applicants must be between 18 and 30 years of age, and pass a medical examination.



Letters to the Editor.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Some Useful Work for Motor Cyclists.

Sir,—This article interests me very much, and as soon as such a corps is formed I hope notice will be given of it, as I should like to offer my services, if the conditions are reasonable. M. LANDAUER.

Club Men for the Front.

Sir,—It is particularly pleasing to note the response made by the Essex Club members to the call to the Colours, but, good as their numbers are, it is even more pleasing to be able to point out that they constitute by no means a record as suggested. Taking sporting clubs of all kinds, the figures of the Birkenhead Park Rugby Football Club, which is reported to have 258 men out of 500 fighting or in training, will require some beating. Among motor cycling clubs, the North-West London M.C.C. is proud of its thirty-five out of a membership of rather under 100. Probably there are others equally good, and it is cheering to feel what effect this must have in regard to the previously admitted hostile public opinion of our sport. It is an everlasting reproof to the writers who so often abuse the "muddied oaf" argument. H. J. POOLEY.

A Trip in the Peak District.

Sir,—Seeing an article in your issue of the 15th inst., "In the Peak District with a Rover," I think you will be interested to know of my exploit through the same district, and on to Leicester and Melton Mowbray, thence to Market Harborough and Welford, with my two-speed 1914 Bradbury and sidecar, my wife and daughter as passengers. We averaged over 78 m.p.g., and through Leicestershire to Welford, then return and out by Melton Mowbray, Oakham, and several other places, etc., we got over 82 m.p.g. Hills we took splendidly. I had no occasion to use tools of any sort during my whole tour. I think 65 m.p.g. very poor mileage. I have a Binks three-jet carburetter, and I am delighted with it. I may add that I also carried my own petrol (three tins) strapped on chassis of sidecar: this was during the first week of the war, when petrol was rather hard to get. R. GREENHALGH.

A Bradbury sidecar owner who relates his experiences in the letter accompanying.

Revs: A Sermon for Speedmen.

Sir,—Your contributor "Singlecyl," in your last issue, falls into a serious error in the example he gives at the end. He assumes that where an engine will turn over at 4,000, but then develop a lower h.p. than at 3,000 revolutions, it is only necessary to lower the gear in order to increase the maximum possible speed by taking advantage of these extra revs.

This is quite incorrect, as a certain speed will require the same horse-power whatever the gear so long as the load is the same. Thus with a gear of 4½ to 1 he would get a slightly lower speed than he would with a gear of 4 to 1, as he would require about 3,500 revolutions per minute for this speed, and at this his engine would develop, say, 8½ h.p., which is less than the h.p. required for that speed.

The instance he gives can only be correct in the case of an engine giving a slightly increased horse-power with the increased revs. (that is, the extra revs. not increasing the h.p. *pro rata*), and in such a case it would be necessary to find out what number of revs. gave the greatest h.p., and then experiment to find out the highest gear you could use, and still attain the number of revs. giving the highest h.p. P 8595.

Gear Slip on Old Machine.

Sir,—In answer to "B 10," I have had a P. and M. two-speed gear on a 7 h.p. machine for the last three years. With the exception of a slight slip it has always been satisfactory. The slip I cured by inserting on the flat side of one of the wedge bars a steel liner ball ⅛in. thick made from a piece of clock spring. This has cured all slip, and the gear is quite satisfactory. W. J. ALCOCK.

Sir,—It appears to me that the thrust rod requires adjusting. I had a similar experience, and traced it to that. Also make sure it is not slipping at the engine-shaft. If the sides of the sprocket plate, and also the ring which separates the high gear sprocket from the low gear sprocket, are worn badly it will slip, as the lock nuts screw tight up to the flange which carries the sprockets without compressing the spring clip sufficiently. Further, if the teeth on all the sprockets are worn, and the chain is also stretched, that will cause it to slip, owing to the wear on all the parts causing the drive at each explosion to be taken up with a jerk, which also sets up a knock in the engine. C. H. INGAMELLS.

Sir,—In reply to "B 10" in your issue of the 22nd inst., the top gear of my P. and M. began to slip last week, and I found that the set pin securing the outer half of the ball race at the outer end of the sleeve carrying the sprockets had worked loose allowing the ball race also to slacken out. On doing this up the slipping ceased, though exactly why I do not understand. It is more likely that the cause of "B 10's" trouble is that the nut securing the gear handle and sprocket wheel is not tight enough, and that the handle slips back a bit after being pushed into top gear position.

The P. and M. gear is excellent, but it has, I think, three minor faults: (1) The handle should be on the left side of the tank; (2) the position of the handle for free engine is indefinite; and (3) the two gear chains cannot be separately adjusted. MX 4045.

The Buyers' Guide.

The Motor Cycle Buyers' Guide of 1915 models (which will be published on November 19th) is now in course of preparation. Any manufacturer who has not received a copy of our specification form is requested to apply to the Editor immediately.

A Severe Test for New Models.

We continue this week our descriptions of 1915 model motor cycles and accessories. An illustrated article, which will prove of great interest at this juncture, is the account of a test of a number of new models on steep acclivities included in the A.C.U. Six Days Trials course.

First Aid Tricar.

Passing the head fire station at Beckenham, a correspondent noted that the five (or is it six?) year old N.S.U. first-aid tricar is still stationed at the entrance in readiness for service. The veteran certainly does not look its age. So far—according to an actual record—it has attended over a score of fires and run over 2,000 miles, including practice runs.

Motor Cyclists' Lighthouse.

One result of the war is that the powerful revolving lamp on the motor cyclists' lighthouse at the Ruxley Corner cross roads, near Foot's Cray, is no longer in operation according to a Government regulation. Illuminating, as it did, the large and Continental type of direction board, and an important road junction, its presence might be a little too useful to an enemy. Still, the warning is missed, as it had become an object of interest on the Folkestone Road.

Another Attempt on the Life of Dr. Low

That inventive genius, Dr. A. M. Low, has been doing much work for the Government lately, and recently inspected a new rifle and sent a report of it to the War Office. A man of German nationality, purporting to be the secretary of the inventor, called on him the other day and presented him with a cigarette, which, on being subsequently analysed, was found to contain a sufficient quantity of strychnine to be dangerous, if not fatal. It may be remembered that *The Motor Cycle* reported a few weeks ago that shots had been fired at Dr. Low from a revolver while he was working in his laboratory.

Consideration for Despatch Riders.

In our editorial article this week we appeal to the Home Office to wipe off all endorsements on licences belonging to despatch riders, and so after the war allow them to start again with a clean slate.

A Novel Two-stroke.

One of the new designs in course of preparation for 1915 is a two-stroke engine, which will have an exhaust valve of orthodox design. The piston performs the work of the inlet valve, as in the ordinary two-stroke design. Complete scavenging is claimed for this arrangement.

The Shaft-driven Rex.

A short time ago we described and illustrated the details of the new three-speed shaft-driven gear which is to be fitted to Rex machines in the near future. We are now able to give a photograph of the forerunner of the complete 1915 model. The neatness of the gear drive will be observed, and the solid frame construction with duplex "chain" stays is worthy of notice. A very neat kick starter has been devised whereby the rear timing wheel is rotated by means of an internally toothed quadrant, the back of which forms a cover which effectually keeps out mud and grit. The construction will be quite clear from the appended sketch. There will be certain minor alterations to the finished machine, but our illustration conveys an excellent idea of the general lines of the 1915 model.

SPECIAL FEATURES

TESTING 1915 MOD. LS.

MILITARY MOTOR CYCLING NOTES.

"PETROIL" LUBRICATION.

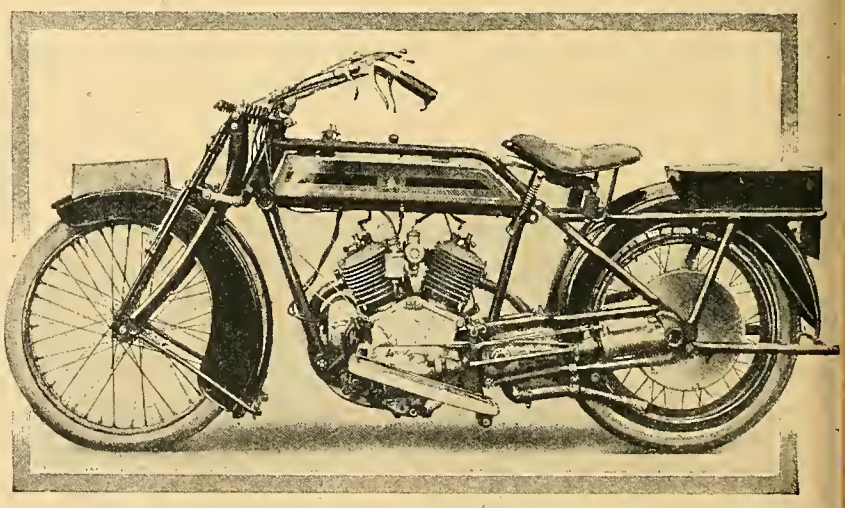
A Government Contract.

A large Government contract will mean that the new Scott will not make its appearance until January, 1915, at the earliest. The contract in question is taking the whole of the Scott Co.'s output at present, and is likely to continue for the next two or three months. Incidentally, Scott machines in 1915 will be obtainable with either a B. and B. or a Scott semi-automatic carburetter.

The Institution of Automobile Engineers

No less than thirty-three graduates of the Institution of Automobile Engineers are at the present time serving in His Majesty's Forces.

In spite of this very considerable depletion of their numbers, however, the London graduates have commenced their session in a very auspicious manner. At the first meeting early this month a very instructive and interesting paper on "Motor Cycles" was read by Mr. E. T. Tapp, who has since joined the Mechanical Transport Department of the Army Service Corps. Following on this paper a visit was paid on October 16th to the works of the Commercial and Marine Engine Co., Hanwell, where among other things, the manufacture of a very interesting two-cylinder horizontal opposed motor cycle engine was seen.



The 1915 model Rex which has shaft drive and three-speed gear.

orth Country Motor Cyclists' Commission.

W. B. Little has obtained a commission in the Durham Light Infantry. He as been in hard training on the North-ast Coast, and expects to go to the 'ront early in December in command of cyclists' company of about eighty men f the Durham Light Infantry.

atriotism at Malvern.

We are informed by the honorary ecretary that one-third of the members f the Malvern and District M.C.C. are erving as despatch riders, while 80% ave enlisted in different regiments.

ew Models in this Issue.

Among the entirely new models llustrated and described in this issue re the new military model single-cylinder ea-Francis, a three-speed L.-F. gear tandardised for 1915, the new 6 h.p. H. three-speeder, a new pilot jet Brown nd Barlow carburetter, the new Match-ss racer with counter-shaft three-speed ear, two new Harley-Davidson machines, 5 h.p. Quadrant, and a two-stroke riel.

olonial Troops and their Mounts.

Our Colonial troops in every case are inging their motor cycles with them, nd many will be their duties as machine un carriers, signallers, and despatch ders. The Australian contingent is, of ourse, no exception, and the Government as placed an order with A. G. Healing nd Co. for the necessary machines, which re fitted with the Precision big four or e 4¼ h.p. engine, as it is generally nown in this country.

xcellent Trading Results.

The Triumph Cycle Co.'s profits for e past year total £74,393 9s. 3d. dding the amount brought forward from st year's account, the amount available r distribution is £89,418 5s. 10d. A vidend of 20% and 2s. bonus on the rdinary shares is recommended, and % dividend on the preference shares. The profits of the firm of Joseph Lucas, td., are, for the year ended August 31st, 14, £25,628 2s. 11d.

e Bulldog Breed.

H.M. the King has been graciously eased to give orders for appointments the Distinguished Service Order and r the award of Distinguished Service rosses in respect of certain officers in cognition of their services. Among ese we note the name of Lieutenant-ommander Max Kennedy Horton, that en motor cyclist who distinguished mself recently by sinking the German uiser *Hela* and the German destroyer *26*. "A Distinguished Conduct Medal s also been granted to Corporal E. J. odhart, Royal Engineers (Motor yclists Second Signal Company), "for nveying messages under very dangerous rcumstances by day and night, and ver failing to deliver his messages." It is with great pleasure that we have record that A. J. Sproston, who is corporal in the Royal Engineers, was mong those motor cyclists who were entioned in despatches last week; but, nfortunately, the authorities printed his me A. J. S. Proston, with the result at few of his friends recognised it.

A Lawn Tennis Champion.

A. F. Wilding, the lawn tennis ex-champion, who, as our readers are aware, is an old-time motor cyclist, has received a commission as second-lieutenant in the Royal Engineers.

An Unfortunate Collision.

A sad accident occurred on the Embankment the other day, when Lieut. Edward Morewood, of the Intelligence Department, riding his motor cycle, collided with a newspaper cyclist and was seriously injured. Both were taken to St. Bartholomew's Hospital, but Lieut. Morewood died shortly after admission. At the inquest his father said he was a crack shot, a splendid horseman, and a motorist of great experience. He was to have gone to the Front almost immediately.

A.A. and M.U. Notes.

Wherever possible, the roadside telephone service, instituted by the A.A. for the benefit of members, is being kept in operation during the war. Members using patrolled roads should note that, although a telephone sentry box on a patrolled road may be locked, the patrol on that particular road will, upon request, proceed to the box with the member, open it, and place the telephone at the member's disposal.

Liverpool Motor Corps.

A corps has been formed in Liverpool with the object of giving military training to motorists, thus rendering them more capable of taking up their duties when called upon. The following classes have been arranged: 1, Swedish drill; 2, map reading; 3, signalling; 4, ambulance; 5, rifle practice. Competent instructors have been engaged. The headquarters and rifle range are situated in Binns Road (off Edge Lane). Information can be obtained from any of the following officials: Chairman, Mr S. W. Carty, 5, Red Cross Street, Liverpool; treasurer, Mr. H. W. Coopland, 26, Islington, Liverpool; secretary, Mr. S. W. Phillpott, A.C.U. Office, 60, Lime Street, Liverpool.

CHRISTMAS GIFTS FOR DESPATCH RIDERS.

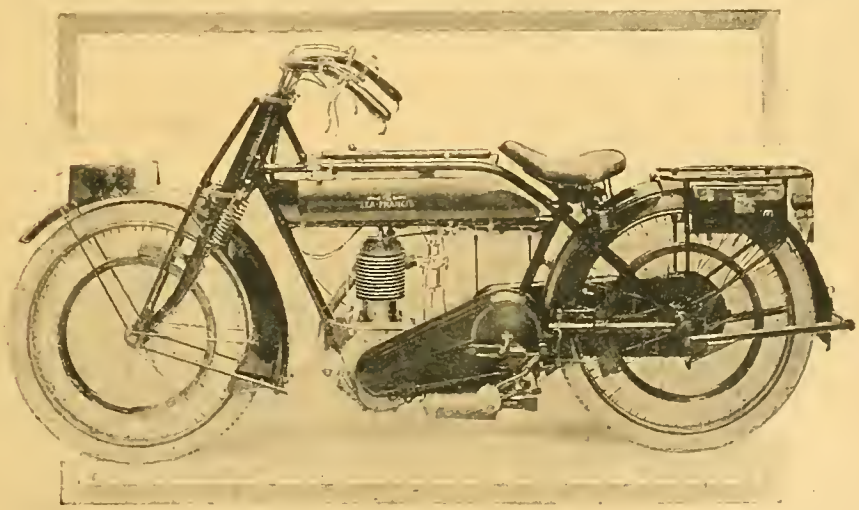
WHEN our scheme to provide useful Christmas gifts for despatch riders at the Front was formulated, H.R.H. Princess Mary's Fund, to provide Christmas presents for all our soldiers at the Front, had not been announced. It is clear that two funds opened with the same object are both unnecessary and undesirable, as the overlapping would be bound to lead to confusion.

The Motor Cycle has interviewed the Secretary of the Committee of the Princess Mary Fund, and has ascertained that despatch riders, motor transport drivers, and, in fact, every branch of the service will be included in the scheme that body has so considerately opened.

It only remains for us, therefore, to ask our readers to forward, in future, their subscriptions direct to the Princess Mary Fund, which has the same objects as the fund opened by *The Motor Cycle*.

There is no question of doubt that this fund is destined to prove one of the most popular yet introduced. The ready response of our readers is some indication of that fact, for every day, without exception, since our announcement appeared, contributions to the fund have been received at our offices. Though mainly in cash, the contributions included offers from prize-winners of the value of prizes due to them. The Princess Mary Fund is a noble and huge scheme, and we commend it to the consideration of readers with just as much fervency as we did the similar scheme which we evolved, singularly enough, just before the national fund was made public. We propose to return all the contributions which readers have been good enough to send us, with a recommendation that the amount be forwarded direct to the H.R.H. Princess Mary Fund.

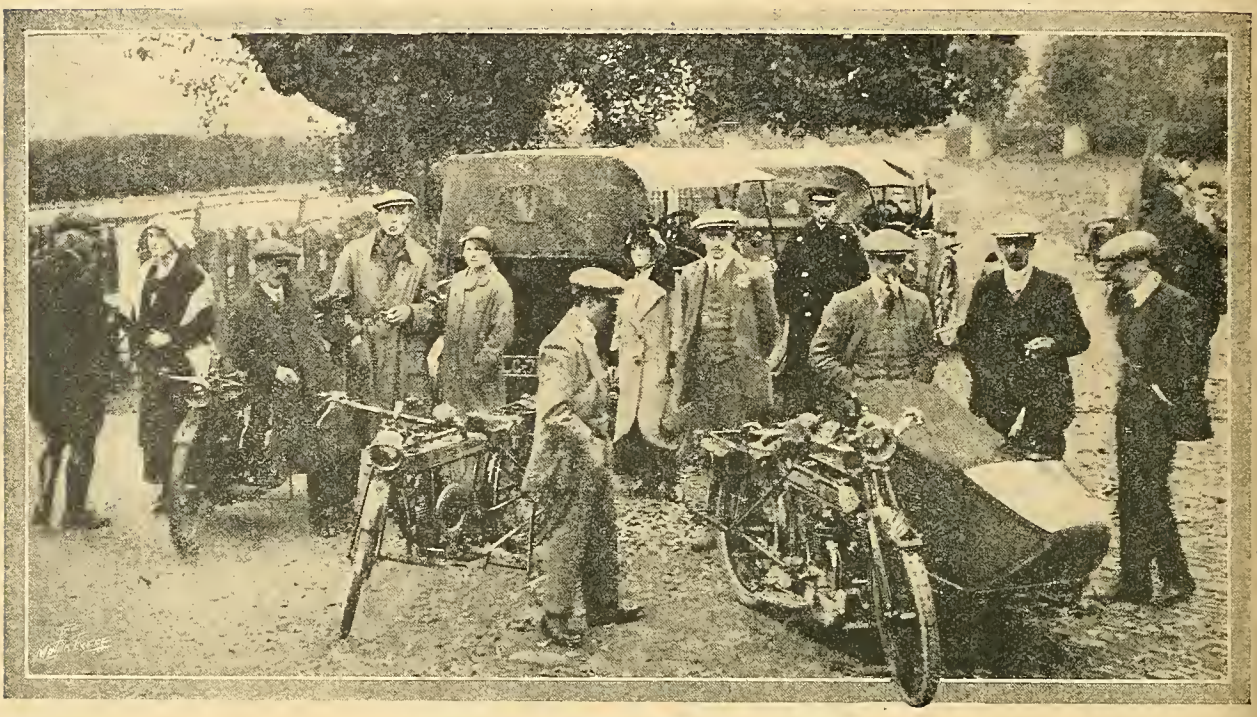
The proprietors of *The Motor Cycle* are forwarding a cheque for five hundred shillings to the fund.



A MILITARY MODEL WITH DETACHABLE WHEELS.

The first specimen of the 3½ h.p. single-cylinder military model Lea-Francis. The engine is a J.A.P., of 85.5 x 85 mm., and the general design is exactly the same as the widely used twin. It has a three-speed gear box, hand controlled clutch, footrests, and semi-T T bars. A section of the gear will be found on page 484 of this issue

The Closing Run of the M.C.C.



THE M.C.C. CLOSING RUN TO HORLEY.

Some of the members and their machines after lunch at the Chequers Hotel. The weather was unpropitious.

UNFORTUNATELY, the morning of the 25th was dull and threatening, but despite the unfavourable prospects there was a very fair attendance at the M.C.C. closing run. About thirty people, who had arrived on motor cycles, sidecars, and small cars, sat down to lunch at the Chequers Hotel, Horley, the appointed rendezvous. Few of the better-known members of the M.C.C. were present, and we missed the familiar faces of Messrs. Jarrott, Head, Jenkins, Gibbons, Dickson, and others. Messrs. C. J. Seed and Southcomb May, the hon. secretary, were, however, present. Lunch was served at 1.30 p.m., and thereafter the party split up and the members went their several ways.

On the occasion of this run we gladly accepted Dr. Low's kind invitation to sample the smooth running of his Adamson cycle car, which pulled well throughout, and climbed Reigate Hill on second speed on the return journey.

It is interesting to note that 140 of the members of the M.C.C. are serving their country in some way or other. So far, the man who has most distinguished himself is Flight Lieutenant Newton Clare, R.N., who took part in the first aerial raid over Germany.

As regards the winter season, it is suggested that a patriotic concert should be held in aid of the Belgian refugees, and that there should be a lecture on the war, illustrated by cinematograph views of the firing line.

CLUB NEWS.

Cyclecar Club.

A number of makers of 1915 model cycle cars and light cars have promised to take part in the rallies arranged for their benefit on November 21st and 22nd at Hatfield and Burford Bridge.

Cork and District M.C.C.

Over a dozen members are now serving at the Front, and the committee have decided to place their names on the Aggregate Challenge Shield for this season. Corp. D. Humphries, R.E., who was mentioned in despatches, is a member of this club. Unfortunately, he has since been reported as missing.

Bristol M.C.C.

A half-day trial will be run off on November 7th from the Queen's Hotel, Clifton, at 2 p.m., distance about fifty miles, for Mr. J. A. King's challenge cup, at present held by Eric Butler. Those interested, especially despatch riders, are invited to attend, as the trial will be of such a nature as to give despatch riders an idea of what they will probably have to encounter. Those wishing to compete may do so, but, of course, no awards will be given, as it is not an open trial. Mr. Grout, the secretary of the Motor Cycle Reserve Committee, will be present, and will note especially the behaviour of the non-official competitors.

BRISTOL M.C.C. ONE-DAY TRIAL.

Entries for this trial, which will take place on November 27th-28th, have already been promised. Entry forms can be obtained on application to Mr. F. G. Cox, 12, Perry Road, Bristol.

It is hoped that the club will be able to secure a large room so that all competing machines can be viewed two days before the trial, and for a few hours afterwards. This will enable manufacturers to show their 1915 models.

The Motor Cycle has suggested to the Bristol Motor Cycle Club that a rule be introduced that all owners of competing machines in the trial be obliged to sell the actual machine at the firm's list prices. This will show that the machines are standard articles as sold to the public and not specially tuned or faked up for competitions.

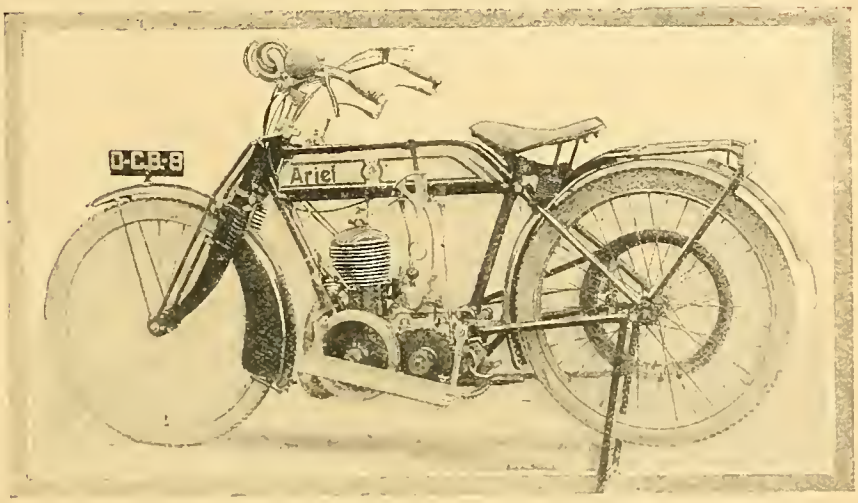
Specifications of all the leading motor cycles on the British market will be included in the annual BUYERS' GUIDE OF "THE MOTOR CYCLE" to be issued on Thursday, November 19th.

An Ariel Two-stroke.

350 c.c. Engine, Two Speeds, Cork Clutch, and Kick Starter.

FOR some time it has been common knowledge that Components, Ltd., of Bournbrook, Birmingham, have been testing various features of two-stroke motors, and therefore the results of their experiments will prove of interest to our readers. We are able to illustrate the machine in its final experimental form, though there is a certain amount of cleaning up in design to be done before the machine will be marketed, such points, for instance, as the substitution of cast aluminium footplates for the wooden footboards shown, and the addition of a neat chain case. The engine is a three-port two-stroke of the usual type, having a bore of 75 mm. and a stroke of 79 mm. (349 c.c.)

A two-speed dog clutch gear box is carried below an extension of the crank chamber, and can be slid longitudinally for chain adjustment. So far no very startling features have been mentioned, but the Ariel is one of the few firms who have realised the value of a clutch on a machine of this type, and, what is more, a simple kick starter is fitted, which renders the machine one of the handiest of its type we have come across. The clutch, it may be mentioned, is of the cork insert type, which is becoming so popular on all types of motor cycle, and it is operated from the handle-bar.



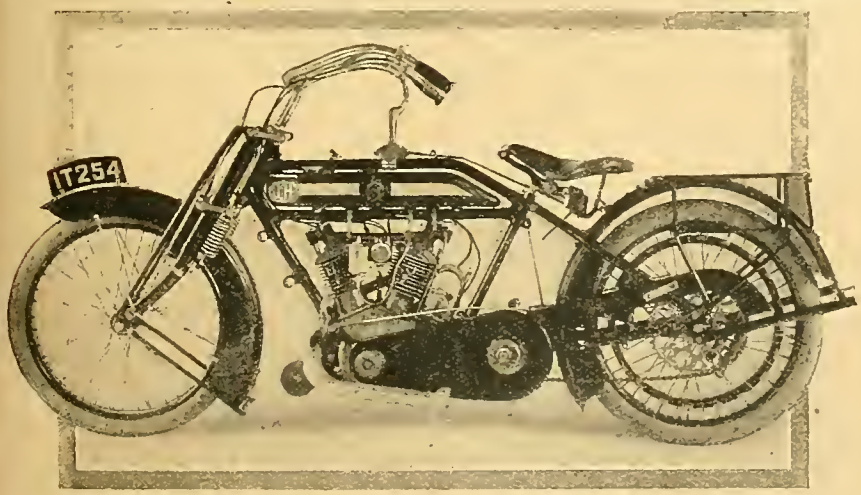
A new two-stroke Ariel with two-speed countershaft gear, clutch and kick starter.

The lubrication is unusual, for a forced drip feed is led to the side of the cylinder and on to the piston, while an auxiliary lead goes direct to the main flywheel bearing, and thence to the crank case by the usual channels. An interesting detail in construction is that the exhaust port is cast with four cooling ribs. The whole machine, with its 26×2½in. tyres and complete specification, will prove a very attractive article at the price of £42.

J.H. Sidecar Models.

WHEN we described the J.H. lightweights in our issue of October 15th we referred to the powerful twin machines of the same make, and we now describe these machines. The 6 h.p. model is turned out with either J.A.P. or M.A.G. engine, the latter being the one illustrated. The engine has a bore and stroke of 72 mm. × 91 mm. (742 c.c.). The inlet valves are overhead, and the enclosed operating gear is lubricated automatically from the crank case. The magneto is carried behind the engine, chain driven, and the B. and B. carburetter is fitted between the cylinders. The three-speed gear box, combined with kick starter and cork insert clutch, operated by the right foot, is placed behind the engine and below the frame, which is raised at this point to accommodate it. The gears are of the sliding dog type, always in mesh, and controlled by a lever on the top tube. The specification includes Druid forks, Dunlop extra heavy or Palmer cord 650 × 65 tyres, voiturette rims, with specially strong spokes, Middlemore and Lamplugh or Lycett saddle, pannier bags, and folding kit of tools, large tank holding two and a quarter gallons of petrol and three pints of oil, and aluminium footboards. The transmission is by ⅜in. chain throughout.

The J.A.P. engined machine is similar in general details but fitted with the 6 h.p. J.A.P. 76 mm. × 85 mm. (770 c.c.), which has forced lubrication and an internal exhaust valve lifter. Only one camshaft is used, and the four valves are operated by two cams. Both these machines are very suitable for sidecar work, and are supplied with the necessary lugs brazed to the frame. To those who require still more power, the 8 h.p. machine (J.A.P. engine, 85½ mm. × 85 mm. bore and stroke, 988 c.c.) will appeal.



The new 6 h.p. J.H. three-speed sidecar machine.

FOR DESPATCH RIDERS.

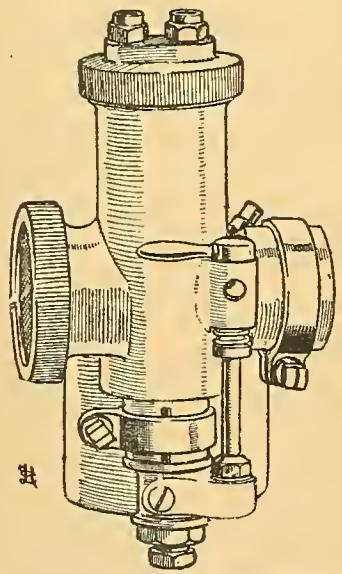
Mr. Philip Grout, secretary of the Motor Cycle Reserve Committee, South Midland Division, will be glad if those riders who desire to enlist in the Royal Engineers (Motor Cycle Section) will register their names with the Bristol Motor Cyclists' War Committee at the Queen's Hotel, Clifton. A form will be provided, which must be filled up and returned. Mr. Grout informs us that he has enrolled some of the most prominent riders in England.

A Pilot Jet B. and B. Carburetter.

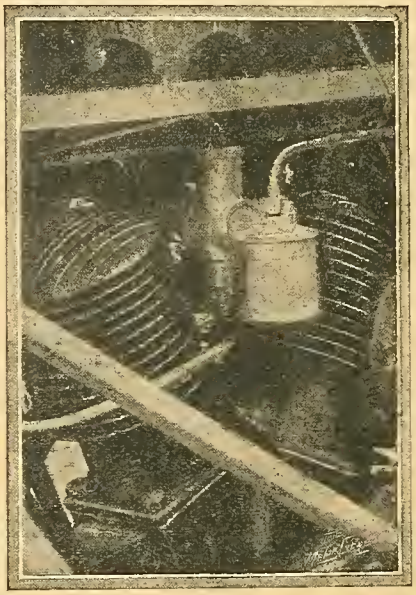
An Easy Starting and Slow Running Device Standardised for 1915.

CONTROLLABILITY at all speeds combined with efficiency is the chief aim of the carburetter designer. There was never any question of the power given off by a B. and B. variable jet carburetter, though starting in temperatures approaching freezing point may have been affected. A new device for 1915 should, however, entirely overcome starting troubles even in temperatures below freezing point. To show the thorough way in which Messrs. Brown and Barlow, Ltd., have prepared for their 1915 design, each type of carburetter has been tested at a refrigerator company's premises for easy starting and general running at all variations of temperature to zero.

The new types of carburetter vary but little in main essentials, but a new design with a pilot, or easy starting jet, forms a novelty that will attract some attention. In all models the float arrangements have undergone considerable alteration, and in future a top feed will be used with the float acting direct on the needle, thus doing away with balance or toggle gear. Besides this an ingenious but simple arrangement allows the jet to be flooded without alteration to the level in the float chamber, with its consequent uncertain mixture. The device is as follows: The usual air vents to the float chamber have been removed and a single hole in the centre of the float tickler takes their place. Consequently, when the finger is placed on this plunger with the purpose of agitating the float, the needle valve is dropped from its seating, but an air lock is formed in the chamber, and, consequently, the level cannot rise, though petrol can flow straight through the jet in a stream.



Showing the pilot jet of the 1915 B. & B. carburetter.



The latest B. & B. pilot jet carburetter fitted to a Matchless-M.A.G.

Except for the addition of a vaporising cap, which is pierced with holes in the top and sides, the single jet model is almost unaltered, and with this type, once the correct position for the air lever has been found, the driving is done almost entirely from the throttle.

Practically the same carburetter can be supplied in the form of the universal carburetter with alternative jet sizes controlled by a small lever at the base.

To Ensure Easy Starting.

Two newer models conform with the usual type of B. and B. carburetter except for the addition of a pilot jet lying close to the vaporising chamber, but on the engine side of the throttle. In one case this jet is only used as an easy starting device, and, once the engine is running, the jet is put out of action by a quarter turn of a small lever placed directly over it.

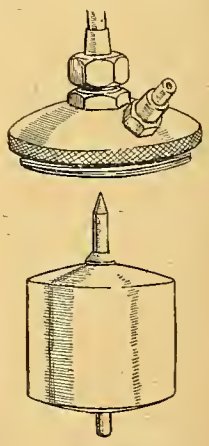
In the other case the operating lever is fitted with a very fine adjustment, so that the pilot jet may be left in action at all times, and can be relied on to keep the engine ticking over when the throttle is closed.

All the latest models are fitted with the air slide enveloped in the throttle slide and moving in dovetail grooves. This gives an easier action, and also, as the air slide is narrow, admits a certain amount of air when the throttle is opened, thus rendering the carburetter more automatic in action. The variable jet carburetter may be set to be controlled entirely by the throttle lever, but the makers recommend the use of the air slide, as a wider range and better consumption can be obtained.

Results of Road Tests.

The new models have been undergoing road tests since the spring, and amongst the results which have been recorded the following may be taken as typical performances: On a very hilly course, with a load of 26 stones, a 6 h.p. Enfield and sidecar travelled 67 m.p.g., a 7 h.p. Matchless-M.A.G. and sidecar accomplished 55 m.p.g., and a 3½ h.p. Triumph bicycle practically 110 m.p.g. These results are with the variable jet model, the single jet carburetter giving a slight increase in consumption in each case. The single jet type is peculiar in that the jet is cupped at the top, which improves starting.

We had the pleasure of a run on an 8 h.p. Matchless-M.A.G. sidecar outfit fitted with the pilot jet B. and B. carburetter, and it was indeed an experience to remember. The engine started regularly at the first dig of the kick starter, and ticked over slowly and quietly like any well-tuned four-cylinder car engine. It was impossible to choke the engine by sweeping open the throttle suddenly, and one could shut it down just as quickly and the engine would continue to tick over without fuss. It was proved to us that the power was in the engine too, and as regards economy we give the makers' test figures above. We must say that we were exceedingly impressed with the exhibition of this the latest B. and B. production, and it is bound to be largely in evidence on the new models for 1915.



The new top feed to B. and B float chamber. It will be noticed that the balance weights have been done away with, and the needle acts direct in the cap.

TWO SPECIAL ISSUES OF "THE MOTOR CYCLE"

are in course of preparation. Both will be considerably enlarged and profusely illustrated. In the absence of the Show they are bound to be in great demand, and early orders should be placed with newsagents.

ANNUAL BUYERS' GUIDE ON NOV. 19th. EQUIPMENT NUMBER ON DEC. 10th.

Question & Replie

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Fuel for an Auto-wheel.

I have just purchased a standard Wall Auto-wheel, and I desire to know what fuel to use. Would you recommend me to use petrol or benzole?—BEGINNER.

You will find that the little engine will probably burn almost any fuel, either petrol or benzole. If you use benzole, be sure and get a good quality. Petrol No. 1 gives slightly easier starting in cold weather.

Valves Slightly Pocketed.

I have a 3½ h.p. T.T. roadster machine, of which the valves are slightly pocketed in the seatings—the exhaust about $\frac{1}{32}$in. and inlet about $\frac{1}{64}$in. Would you kindly inform me if this amount of pocket would have any effect upon the engine, and if you would advise the seatings to be re-cut?—G.B.P.

A pocket of $\frac{1}{32}$in. will reduce the area of your valve opening with average sized valves by about $\frac{1}{8}$ of a square inch. This is equal to a circle of approximately $\frac{3}{8}$in. diameter, and would interfere considerably with the passage of the gases. We should most certainly advise you to have the seatings re-cut. It is quite a simple matter.

A Badly Fitting Piston.

I recently had a new piston fitted to my machine, but as the running was still very poor I took the cylinder down and found little or no deposit, but piston and rings quite black all over, except quite small patches near bottom edge of piston and in places on rings, which are quite bright at back and front. All other parts of piston were covered with sticky deposit, which comes off when rubbed hard with paraffin rag. Does this not show that the piston is a bad fit, and account for oil being driven through pulley bearing, as explosion is evidently getting by. I use good oil and plenty of it. The sidecar has a castor wheel, and runs easily.—F.J.P.

It certainly looks as if the piston is a poor fit. Of course, after a new piston has been fitted, a machine will not run as well as it did before, and this state of affairs continues for about the first two hundred miles, but it gets better every time the machine is taken out, and finally the old power returns when the piston has become run in. The leakage of oil through the pulley bearing may be due to two causes. Firstly, that the bearing is a bad fit, and, secondly, the relief valve in the crank case is not working properly, possibly through being stopped up.

The Auto-wheel.

Please tell me your opinion of the Wall Auto-wheel, and also state what speed it should be capable of attaining.—E.C.

The speed of the attachment in question is about sixteen miles an hour. It is quite a handy device for use in town, but you must not expect to get the same results from it as you would from a light-weight motor bicycle.

Loss of Power.

I have a 2 h.p. three-speed Humber, which after running on top gear for about two hundred yards loses power. I change down to middle gear which improves it for some little while, then I find I cannot get along on that and change to bottom gear, and after a little time (a quarter of a mile and less) the engine loses power completely, slows down, and stops, but if I let the clutch out and in I can proceed, but it is impossible to do more than twenty miles per hour on top gear, and the machine will never look at a hill. The timing is absolutely correct. The machine has only behaved quite recently like this. Can you please tell me the remedy?—G.H.M.

The trouble seems to be rather a puzzling one, but it may be due first of all to overheating, which, of course, may occur through a variety of causes, such as too strong a mixture, exhaust valve mechanism not working properly, want of lubricating oil, lubricating oil of poor quality, etc. We think it is more likely, however, that something is binding either in the cycle part of the machine or the engine. The trouble is one which is exceedingly hard for us to diagnose without actually seeing the machine.

Wellingborough to Glasgow.

I should be very much obliged if you would inform me of the best route from Wellingborough to Glasgow. The distance, I believe is 300 miles (approximately). I hope to do this, if possible, in one day. My machine is a 4¼ h.p. Precision, Sturmey-Archer three-speed hub. I do not object to hills, but dislike traffic.—J.T.M.G.

We should recommend the following route: Wellingborough, Kettering, Rockingham, Uppingham, Oakham, Cottesmore, Grantham, Newark, Tuxford, Retford, Bawtry, Doncaster, Ferrybridge, Aberford, Wetherby, Boroughbridge, Leeming, Scotch Corner, Barnard Castle, Middleton-in-Teesdale, Alston, Brampton, Longtown, Gretna Green, Lockerbie, Beattock, Crawford, Abington Inn, Hamilton, to Glasgow. To do this journey in a day you would have to start very early in the morning, and drive fairly hard. You may expect a good deal of unavoidable traffic on entering Glasgow.

Sidecar Alignment.

(1.) I have a sidecar the tyre of which always wears away quickly, and yet I think everything is in line, as on a straight road I can loose the handle-bars and steer straight. (2.) Should a sidecar wheel be level with the back wheel as on a motor car? (3.) Do you think a slightly bent spindle would cause the trouble, as I think I have bent mine when turning sharply to the left?—T.P.

(1.) It is exceedingly difficult for us to account for the trouble to which you refer in your letter. If the machine steers well on a straight and level road the alignment should be correct, and there is no reason why the tyre should wear unduly. (2.) It does not matter very much if the sidecar wheel is level with the back wheel or not. (3.) If the spindle is bent it would cause the trouble. The bent spindle should be heated and then trned up.

OUR ADVICE TO CLUBS.

At a time when every motor cyclist is anxious to serve his King and Country, and when all army vacancies are for the present filled, the advice of "THE MOTOR CYCLE" to Club Committees is to encourage members to cultivate assiduously an intimate knowledge of their own particular localities, to become well versed in the art of map reading, and practised in the handling of a rifle, as well as a revolver, so that, should their services be required, they will be as useful as possible.

Ordinary competitions having been cancelled, Clubs might well arrange map reading contests and reconnaissance tests in districts not occupied by troops.

Cyril Williams (A.J.S.), second in the 1914 Junior T.T. Race, and winner of the Junior T.T. Race at Brooklands, 1914, now on active service in France. His namesake, Eric, who won the Junior Race, went to France at the same time.

Magneto Lubrication.

I have bought a 2½ h.p. Jap-Wolf, and do not know how to oil the U.H. magneto. Does this enclosed type require oil, and, if so, where does one put it in? I understand Bosch magnetos, but have never had a U.H.—G.F.B.

The bearings of the U.H. magneto are packed with grease, and require no further lubrication. The magneto, in general principle, is not dissimilar to the Bosch.

Tight Piston Rings.

I have a 1914 Triumph, and thought I would take the cylinder off and clean it. When I tried to put the cylinder on again I had a fearful job to get it on to the piston, and when on it took both hands as hard as I could pull the wheel to get it to budge; so with great difficulty I took the cylinder off again to see the reason, and at the same time oiled the piston and cylinder well, but still I cannot get the cylinder on.—J.J.

You have probably got some dirt under the piston rings which prevents them from bedding properly in their grooves. Take the piston rings off very carefully (they are very brittle) and clean the grooves and the inside of the rings, then oil and replace carefully, pressing the rings down into the grooves as the cylinder is slipped over the piston. No force should be necessary.

General Lack of Power.

Could you kindly inform me the reason why my engine has lost its power? It is a 4 h.p. single-cylinder Peugeot. I have just had it re-bushed, and it will not take sidecar on the level with top gear in. I have tried it on hills with bottom gear, but it is quite as bad. I have had the cylinder off, and I find that the weight of the piston will not cause it to fall to the bottom.—J.R.C.

We should say that the loss of power is probably due to the re-bushing of the engine, which is not yet quite free enough. This, however, will get better after a little running. If not, the parts must be dismantled and examined for a tight bearing.

Petrol Level.

I have a 1913 4 h.p. L.M.C., fixed gear, with sidecar, which previously used to slow down and then pick up; this I put down to the carburetter, and sent it to the makers to fit new balance weights, needle, float, etc. Now when the petrol is turned on it drips at the bottom of spraying chamber, and the engine gets very hot while running at normal pace, gear 5 to 1. A new plug has been fitted, carbon has been cleaned out of the cylinder, and new rings fitted.—A.S.H.

The trouble is due to the petrol level being too high, or to grit under the needle. Either would account for the flooding of which you complain, and also the overheating, but the latter may be caused by the new rings being rather too tight a fit.

Hill-climbing Power of Auto-wheels.

I think of buying an Auto-wheel to fix to my three-speed gear Raleigh, and should feel much obliged if you would answer the following questions: (1.) Would it take me up any reasonable hill without severe pedalling (I am 11 stone)? (2.) Is registration, licence, and taxation same as for motor cycle? (3.) Is there much vibration to rider? (4.) Would it be likely to shake any of the cycle parts loose, or otherwise damage machine? (5.) Would it be likely to give any more trouble than an ordinary motor cycle engine? (6.) Is there any difficulty as regards oiling? (7.) What speed could I get out of it without damaging the engine?—J.W.

(1.) The attachment referred to would take you up any reasonable hill with a certain amount of pedalling. (2.) The registration, etc., are the same as for a motor cycle. (3.) There is no vibration from the engine, but as a pedal cycle is ridden, the road vibration is worse than when riding a motor cycle. (4.) We do not think a pedal cycle would be damaged by the use of the attachment. (5.) It should not give any more trouble than a motor cycle engine. (6.) No; the lubrication is efficiently carried out. (7.) The speed is about 16 m.p.h.

READER'S REPLY.

Experience with a Two-stroke.

I have now run my machine some 1,200 miles, and have had no engine trouble or punctures to date, and have ridden in all weathers and over all surfaces. I have friends who have other makes of lightweights—fixed and variably geared—but not one that can equal me at hill work. The little engine simply delights in a stiff climb, and I have climbed Bury Hill, Arundel, against a strong head wind, when a friend on a 3½ h.p. "conked out." Another point in favour is that it really does two-stroke, either at 5 or 35 m.p.h.—a feature that is conspicuous by its absence on many other two-strokes, and one, I think, that counts in the number of miles obtained to the gallon. Surrey is not a flat county by any means, but I can easily get 125 m.p.g., and have lately been using benzole, which adds, roughly, another 10 m.p.g., and improves the running considerably. A variable gear is an improvement to any machine, but is not a necessity to the Radco, as one can easily throttle down to walking pace for traffic, and it will climb anything to 1 in 4 with ease.—A. E. JACKSON.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"G.H." (London).—2 h.p. Calthorpe Junior. General efficiency, power on hills, silence, and weight of rider that it will comfortably carry.

"H.K.S." (Derby).—2¼ h.p. Sun-Villiers and 2 h.p. Precision Junior. Reliability, hill-climbing, petrol consumption, wearing qualities, and gear.

"H.L.J." (Herts).—2¼ h.p. two-stroke New Ryder. Suitability for touring and retention of compression in crank case after reasonable mileage.

The French Government recently issued a requisition for all motor vehicles likely to be of service in the war, and the above reproduction shows a corner of the group, which collected in response to the appeal, in the Place des Invalides, Paris. Quite a number of motor cycles were included in the gathering.

Expressions of Delight

A great proof of the real quality of Clinchers lies in the vast number of users who have written us testifying to the extraordinary durability and reliability of these tyres. Another great point is they are constantly telling their friends. So the tyre army of Satisfied Users is growing daily, and on every make of machine, on every road, the man who gets the best service is the man who rides Clinchers. They are

ALL-BRITISH

and their service is summed up in the following—Extraordinarily Long Life—Consistent Reliability from first to last—Superb Resiliency and Freedom from all tyre troubles and skidding.

"The Tyres that are Superior"

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

Abingdon.

ABINGDON, 1913, 3½h.p., 3 speeds and clutch, Dunlop tyres and belt, P. and H. lamp set, horn, and tools, splendid order; £30. — Elce and Co.. 15, Bishopsgate Av., Camomile St., London, E.C. [0491

[8401

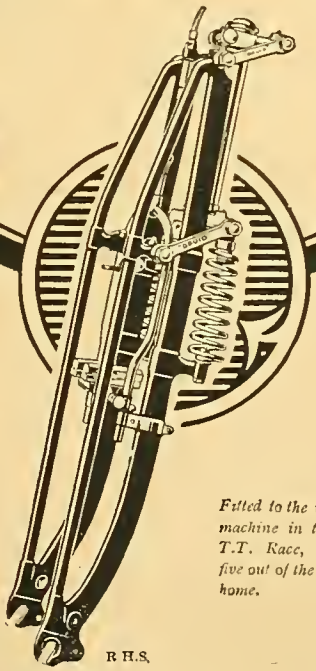
DRUID

It is about as wise to select a machine without the "DRUID" Spring Fork as to choose solid tyres in preference to pneumatic.

Being universally recognised as the ONLY PERFECT device for totally absorbing vibration and road shock, to INSIST on the presence of the "DRUID" in the construction of the machine you purchase is surely only wise and reasonable!

We will gladly send you full particulars of the "DRUID."

A. DREW & Co., Ltd., Leopold Street, BIRMINGHAM.



Fitted to the winning machine in the 1914 T.T. Race, also to five out of the first six home.

R.H.S.

TYRES.

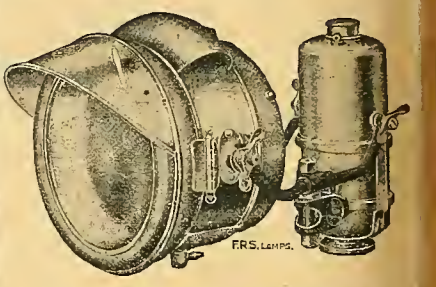
F.R.S.
LAMPS AND GENERATORS, HOLD WORLD'S RECORDS.



FAMOUS BEAM

Coupled with the F.R.S. Lamps is now known all over the world. **NO OTHER MAKE** can compare with it. It is dearer no doubt, but isn't it worth it? The best is always cheapest, and you positively **RIDE IN DAYLIGHT** through the night.

Lens.	Beam.	Price.
6 in.	1,200 ft.	72/6 and 78/6
5½ in.	1,000 ft.	62/6 and 68/6
4½ in.	800 ft.	52/6 and 58/6

READ THIS.

To get the best you must pay well. We have made our name with quality alone, and we claim that our lamp is up to

90% more powerful

over any other make. Our lens is costly, and it is genuine. You will see what a costly mangin lens can do, if you try the light of the F.R.S. against any other.

F.R.S. Lamps, Pershore St., B'ham.

OVERALLS MADE BY A PRACTICAL RIDER

THE MAN WHO RIDES KNOWS WHAT IS WANTED.

I have over 10 years' experience as a rider in all weathers, and I have gradually perfected a suit of overalls to meet my own requirements as a traveller.

The business rider needs to keep smart—dry and comfortable. Whether you ride for business or pleasure, these conditions are essential if you are to enjoy your riding. Don't throw away your money on things that are absolutely useless for your purpose.

I have explained all about this subject in an illustrated booklet. You'll be interested—send a postcard for it to-day to I. SMITH.

MOSLEY & SMITH
Buttershaw, Bradford.

7,000 Extra Miles for 13/6

"A.E.A." writes: "I had a cover retreaded by you last year. I have run this on my back wheel ever since, covering about 7,000 miles. Being so satisfied, I am forwarding same cover to be retreaded again....." This

Beldam Retread

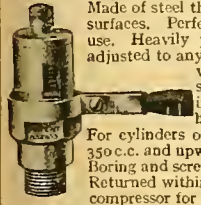
cost only 13/6. Beldam Retreads last longer than many ordinary covers because of the high quality of Beldam Material and Workmanship.

Send us your old covers and we will quote you cost of retreading by return. If you do not need our Services now, send for Retreading List. It contains full particulars of prices for Retreads and Repairs of all kinds.

The Beldam Tyre Co., Ltd.,
Brentford, - - - Middlesex.

The ENDRICK DECOMPRESSOR

Accepted by the War Office and used by the Allies'
DESPATCH RIDERS
(See the pictures from the front).



Made of steel throughout, with large bearing surfaces. Perfectly gas tight when not in use. Heavily plated. The handle can be adjusted to any desired position and is convenient to operate. Standard sparking plug thread. Fits into valve-cap or second plug hole.

For cylinders of 350 c.c. and upwards **8/6 each.**
Boring and screwing valve-cap 1/-.
Returned within two hours of receipt. A decompressor for Lightweights can be supplied to order. Suit 2½ J.A.P. and Singer; also engines as small as 1¾ h.p.

A boon in peace or war.
All agents can supply, or direct from—
Endrick Engineering Co., Warwick Rd., OLTON, B'ham.

Prices are on rail Staines Station.

These houses are tenants' fixtures, and can be bolted together in a few minutes. They are made of sound, well-seasoned matchboard, and complete with floor. Window in any desired position. Roofs of Stoniflex Felt. We treat each house with Brown Sideroleum Catalogues with particulars of other sizes Free.

PUNCTURES HAVE NO TERROR

IF YOU USE THE RICH DETACHABLE AIR TUBES

With free air passage. No butt ends to burst

Made in all sizes, 1¼ to 3½.

Reduced price .. 26 x 2, 11/- 2½, 12/- 2½, 14/6.

Endless or butt ended converted, **5/-** and **6/-**

Address: **RICH. Crawley, Sussex.**

"SWAN" SIDECARS

OXFORD.

MISCELLANEOUS.

COWEY Speedometer, guaranteed. 29/-; N.A.B. spring seat pillar, 5/-.—Bleacathra, Highfield Rd., Walton-on-Thames. [X1886

MAGNETO Twin, perfect, also 9h.p. Riley car, and quantity motor goods; cheap.—Davies, 1, Hillside, Stonebridge Park, N.W. [X1856

DURING the war, to stimulate business, great reductions in accessories. Send for price list.—Scholes, Pasture View, Armley, Leeds. [X1876

CARBURETTER?—Badcock's By-pass will make yours better than the best; see displayed advertisement in last or next issue. [0261

N.S.U. 2-speed, fit Bradbury, used solo only, new pulley fitted, not since used, equal to new; £4/10.—Hallworth, Midway, Poynton, Cheshire. [X1932

SHED, suit combination, lamp set, 28×3 cover and tube, T.T. bars, speedometer, Klaxon and Lucas horn, etc.—Stoner, 110, Highgate Rd., N. [X1812

LUCAS King's Own Lamp Set, as new, used once, perfect condition; cost £1/12/6, accept 25/-, bargain.—F. E. Johnstone, Westcott, Wantage. [8352

BOOTS.—Save nearly 50% buying from factory direct. Agents wanted. Send postage 2d. for list and particulars.—British Boot Co., 274, Portland Sq., Bristol. [7617

MABON Clutch, adjustable pulley, ¾ bore, fit Rex, little used, 37/6; forecar frame, 26in. swivel wheels, springs, 7/6.—Chevill, Willingham, Cambs. [8284

SIDECAR Hood, new, with fittings, 28/-; pair Druid spring forks, 25/-; new twin magneto, watertight, £3/18; Bosch single, £3.—Brown's, 12, Bull Ring, Birmingham. [X1969

MOTOR Castings, attachments; castings, 2b.p., 24/- upwards; repairs, boring, new pistons. Model ½h.p. tooled motors, 9/9; catalogue, stamp.—Littleover Motors, Derby. [X1726

PAIR Electric Side Lamps, torpedo, cycle car or small car, 16/-; 26×2½ Palmer, good cover, 10/6; 26×2¼ ditto, 9/6; 700×85, also 700×80, 12/6.—Day, 84a, Newark St., New Rd., Stepney. [X1975

50 Leatheries De Luxe Large Size Saddles, fitted patent anti-vibrating springs, 8/6, list price 15/6; Binks 1913 2-jet carburetter, to suit big-powered engine, 15/-.—Pitts, Redditch. [8402

REX Frame, girder forks, mudguards, tank and fittments, saddle, handle-bars, Bosch mag., splendid condition; £4/5; 3½h.p. Rex engine, £3; lot £7; offers considered.—Teesbridge Brickworks, Stockton. [X1949

26×2½ Tube, 4/6; 1913 Senspray, 16/6; 26×2¼ steel-studded tyre, £1; tool kit, 6/6; splendid large brass head light and generator, as new, less bracket, 25/-.—Curd, 35, North Rd., Brighton. [8362

COMPLETE Head Light, perfect, 12/6; 3½h.p. Humber cylinder and piston, 15/-; sidecar wheel, new, plated, 10/-; adjustable pulley, 4/6; motor suit, new, 22/6.—Fearn, Drapery Stores, Alfreton. [8385

MISCELLANEOUS.

FOR Sale, complete electric light house plant, £35; Sherborne engine, petrol driven, 14 glass cells, 250 candle-power, 30 volts, 8 amperes; or exchange motor cycle combination.—Druids Head, Herne Bay. [8243

XL'ALL Pan Saddle, cost 50/-, as new, 35/-; B.B carburetter, 15/-; coachbuilt Pillion seat, cost 25/-, never used, 16/-; valve grinder, new, 3/6, or offer; no use to owner.—Bran, 20, Foulton Rd., Earlsfield. [8244

FIRST Remittance £3/10 secures 3½h.p. Rex engine, nearly new B.B., coil, dry battery, frame, wheels, and tyres, and numerous accessories, ready to make into good motor bike.—B. Shorter, 1, Audley Rd., Saffron Walden. [8227

MOTOR Oil, highest viscosity, non-acid, non-gumming, impossible to obtain better; sample gallon 2/3, 5 gallons for 10/-. Don't pay fancy prices.—Aldridge, Islington Green, London, N. Established 100 years. [7408

VERY Low Up-to-date Frame, 25/-; 2-speed and F.E. counter-shaft gear, 35/-; B. and B. carburetter, 14/-; ditto lightweight, 13/-; J.A.P., others; 28×2 wired Michelin, 6/-.—Riley, 17, Stockport Rd., Ardwick, Manchester. [X1833

PULLEYS for any motor.—Dion, 6/-; Motosacoche, Moto-Reve, 4/-; others 4/9 each; adjustable pulleys, 10/6, plated, guaranteed, carriage paid.—J. Perkins, 455, High Rd., Leyton. 'Phone: 248 Walthamstow. [8196

VILLIER'S Free Engine Hub, built into 26×2¼ B.E. rim, with brake rim attached, 19in. belt rim, for ⅞in. belt, complete with all controls, perfect; accept 30/-.—Dene Motor Cycle Co., Haymarket, Newcastle-on-Tyne. [X2000

N.S.U. 2-speed Gear, equal new, £3/15; high tension magneto, perfect, 30/-; Rex frame and tank, 7/-; lamp and generator, 7/-; carburetter, 3/-; Rex torpedo £15 cane sidecar, £3/10; 1913 torpedo cane body, 35/-.—138, Catherine St., Leicester. [X1927

N.S.U. 2-speed Gears in stock to fit all known makes at 1914 reduced prices. The easiest gear on the market to fit, no alteration to the motor cycle necessary, ideal for sidecar work. Trade enquiries invited; specialists in repairs to these gears; all spares stocked.—Eagles and Co., High St., Acton. [X1917

MAUDES.—Any of the undermentioned sent on 3 days' approval against remittance: Pillion seats, 3/3; tool kits, 9 tools, 4/-; various toolbags, 2/- each; second-hand belts, various lengths and sections, 3/6; Pillion seat and footrests, new, 10/-; shop-soiled lamps, back fixing, 5/- each; horns, various, 3/-; new 4-cyl. Ruthardt magneto, 85/-; new 1913 Binks carburetter, 25/-; P. and H. shop-soiled complete lamp sets, large size, 20/-; Powell and Hanmer ditto, 14/6; Cowey speedometer, new, 57/6; ditto, second-hand, 37/6; valves, all engines, 2/- each; shop-soiled N.S.U. gears, £5/5 each; torpedo wicker sidecar bodies, like new, 25/-; second-hand carburetters, B. and B. 12/6, Lukin 15/-, lightweight Senspray 20/-.—136, Great Portland St., London, W. [8395

SIMPLE SAFE SURE

Our 'Standard'

Standard BELT FASTENERS

are before all else Simple, Safe, and Sure. A belt fastener that has unique features yet is not complex and has no freakish ideas embodied. Just a plain, straightforward, serviceable fastener made on correct principles, and that has proved its worth in Trials and private service everywhere. Users write: "....have found yours the most reliable and satisfactory...." "....most satisfactory of any I have used." Over 365,000 were sold in 1913. Think of it—a thousand every day of the year—and all giving satisfaction. Now why not do away with your belt trouble once and for all. We guarantee all our fasteners for ever. We couldn't do more, could we?

Why does an Engine Konk?

ONE of the most interesting problems in connection with internal combustion engines is the cause of pounding in an engine, or what is commonly known among motor cyclists as "konking."

In this issue we publish an article on the subject, in which the writer differentiates between konking as applied to motor cycle engines, pinking as applied to cars, and piston tapping, a term used by gas engineers on the one hand and knocking (due to a loose bearing) on the other. The article forms interesting reading, and will, we hope and expect, lead to an interesting and instructive discussion on the subject. Most of the arguments apply to the "T" or gamma-headed types of engine as on cars, the rock of the piston due to the side thrust of the explosion being, briefly, the cause of konking. The conditions in the case of a motor cycle engine are, however, somewhat different, as the valve pockets, in the majority of cases, are at the side, and consequently the angularity of the connecting rod does not tend to drive the piston toward the valve pockets. This fact somewhat destroys the weight of our contributor's arguments, and it is clear that a motor cycle engine requires special treatment. The writer's conclusions favour the overhead valve type of engine, the hemispherical cylinder head and a central position for the sparking plug. It is certain, however, that an engine conforming to the ideals laid down would not be entirely immune from konking, and as the theory of side thrust of the piston due to the valve position causing konking is somewhat destroyed by the fact that the valves are not in front of the engine in the case of a motor bicycle, though the argument may apply to cars, we must seek further for the true causes of konking. We are, of course, dealing with a clean engine. The formation of carbon deposit will quickly lead to pre-ignition and consequent konking if the engine is given hard work for any length of time.

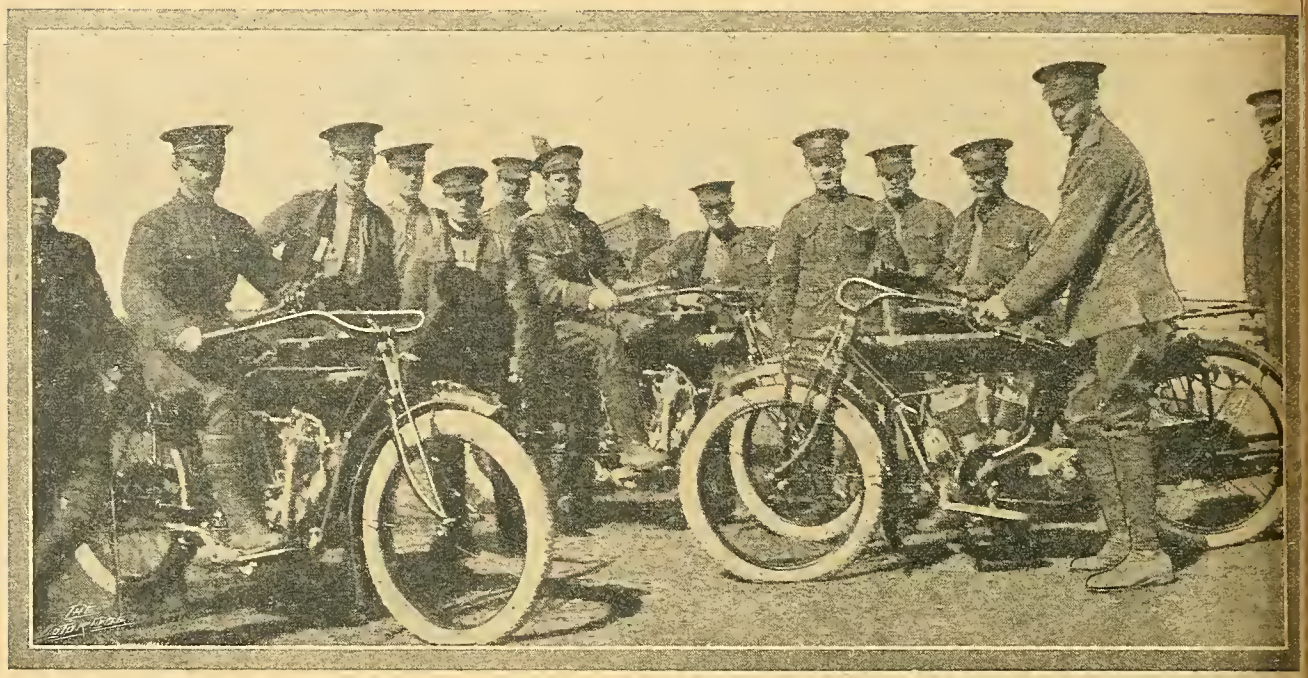
To Encourage Two-strokes.

THE ever-increasing number of two-stroke motor cycles on the road shows that the movement has gained a firm hold, and that the advantages of this form of engine in the way of simplicity, even torque, lightness, and low cost of manufacture are being more and more appreciated. Trials have shown that even the lightweight two-strokes are thoroughly reliable, and machines of under 300 c.c have obtained maximum awards in both the Scottish and English six day events of 1914.

The experience of many of our present day designers is founded on launch work, and in consequence our present types of motor cycle engine are likely to be subject to very considerable improvement before long. The question of the best and quickest method of hastening forward these improvements arises, and it appears that a special class or classes for two-strokes only in the various reliability trials, hill-climbs, and speed tests at Brooklands (especially the latter) would be an immense help in this respect. At the present moment few two-stroke motor cycles would stand much chance against engines of the four-stroke type in their respective classes, and for this reason they do not appear on the track. Now it is generally admitted that Brooklands has provided some of the most valuable experience possible, and manufacturers of four-stroke engines have not been slow to embody the results of such experience in their standard designs, consequently it would seem wise to encourage two-stroke engines on the track to the greatest possible degree, so that designers may have every opportunity of picking up such knowledge as cannot be obtained by drawing office and test shop work. On the score of simplicity alone the two-stroke is well worthy of encouragement, and when the many other advantages of this type are considered it becomes a matter of some importance that the brains of some of our cleverest designers are turned towards the light and cheap two-stroke engine.

Motor Cyclists in the Canadian Troops.

Their Up-to-date and Complete Equipment.



Some of the motor cycle squad of the Canadian Field Force at ease.

WITH the exception of aeroplane equipment, the first Canadian Expeditionary Force of 32,000 men, now on Salisbury Plain, is probably as completely fitted as any of the allied troops engaged in the European conflict. The mechanical section includes automobile gun batteries, motor ambulances, officers' cars, repair shop vehicles, and, last but not least, an efficient motor cycle and bicycle corps. In addition, the Ninetieth Regiment from Winnipeg has a decidedly interesting fighting accessory in the shape of a motor cycle machine gun unit, consisting of a 7 h.p. two-speed motor cycle and sidecar upon which is mounted a modern quick-firer. This machine was illustrated in *The Motor Cycle* of September 10th.

Motor Cycle and Bicycle Squad.

Wild rumours always accompany or follow extraordinary events, which is the reason why the report has been heard that Montreal patriots were equipping a motor cycle brigade of 200 machines to accompany the Canadian Army. Such is not the case, and, incidentally, it may be mentioned that there are not 200 motor cyclists in the whole city of Montreal. But the motor cycle and bicycle squad that has recently arrived in England will undoubtedly prove its mettle when the supreme test comes.

The squad is made up of thirty-two motor cyclists, mostly from Toronto (the real centre of riding in Canada), and about 300 push cyclists gathered from many points. The Toronto motor cyclists are made up of crack dirt track racers and competition riders of note, several of whom are very prominent in local club circles. For obvious reasons it is not permissible to give a list of the members of the squad.

Properly Equipped and—

These staunch riders have the best of equipment for this, their greatest test of endurance. The thirty-two men have fifty brand new Indian 7 h.p. two-speed machines at their disposal, eighteen of which were not even uncrated before they reached England, and are being held in reserve in case of emergency. No less than 500 Canadian-made bicycles have been supplied for the Canadian cycling soldiers. This means about 200 bicycles in reserve. In addition to the usual equipment to the machines, a great stock of tyres and other necessary fitments has been brought.

The Toronto branch factory of the Hendee Mfg. Co., from which the fifty Indian motor cycles were purchased by the Canadian War Department, gave up several of its expert repair men and mechanics to look after the machines at all times. These men will not be handicapped for lack of machinery, because the Russell Motor Car Co., of West Toronto, was called upon to supply several travelling repair shops, the machinery of which includes lathes, drills, reamers, etc. One of these will be at the service of the cycle brigade.

—Well Fitted for Arduous Work.

While the duties of the Canadian riders will not be more than the usual work of men attached to the British Intelligence Service, "Jack Canuck" can be relied upon for a bit of rough-riding when occasion demands. Accustomed to rotten roads and wintry weather (in season), the Dominion bicycle-punchers will surely give a great account of themselves, especially during a winter campaign. And they're prepared! Last winter these self-same stalwarts were riding in and around Toronto in near-zero weather *for pleasure*. They wouldn't be Canucks if they didn't like snow and frost.

At the time of writing Canada is making ready for a second contingent of 22,000 fighters, and there will be no difficulty at all in raising a second motor cycle and bicycle squadron.

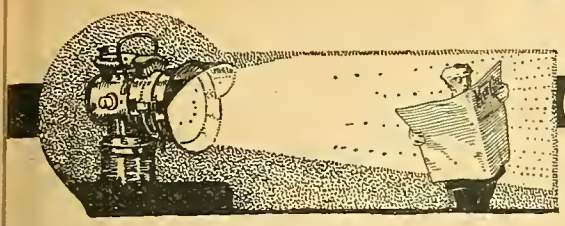
One of the most prominent of Canadian motor cyclists now seeing active service is Lieut. Miles, of Napanee, Ontario, a graduate of the Royal Military College, of Kingston, Ontario. Lieut. Miles is with the Intelligence Corps attached to the headquarters staff of General Sir John French.

Another well-known North American who has already crossed the wide sea to fight for Britain is W. Reid, son of Hon. W. D. Reid, former Premier of Newfoundland. He left with the intention of enlisting as a motor cycle despatch rider.

Even while keeping the trade flag flying, a number of Toronto's motor cycle tradesmen have allied themselves with the Motor Trades Rifle Club of Toronto, which has been organised for the purpose of home defence, and for service abroad if necessary.

A WELL-KNOWN RIDER WITH THE COLOURS.

John Gibson, whose face and name are familiar to all keen followers of motor cycle events, writes us from West Hartlepool where he is quartered. He is attached as motor cyclist to the 7th Battalion Devon Regiment with the rank of lance corporal.



Occasional Comments

"By Ixion"

A Timid Tip!

After the *exposés* by which several venerable tips have recently been humiliated, I should hesitate to quote another, if I had not just proved its worth. The other day a short spin on my wee two-stroke unconsciously developed into quite a lengthy journey, and on the return I hustled the baby along at 35 m.p.h. for a prolonged distance over rough roads. I was just murmuring to myself, "Something is bound to go soon," when I felt a wet spray on my leg, and looking down saw that petrol was pouring out of the tank, and that the petrol pipe stub had come unsoldered. I was out of the saddle and had the machine flat on its side on a grass bank in a jiffy, thus saving as much of the precious juice as possible. A visit to a cottage procured a cake of soap and some string. The string was lashed round the tank so as to tug the stub up into the tank hole, and the joint was then caulked with soap, and bound with more string. When finished, there was no leakage at all; and during the five miles home the improvised repair only shed a few petrolic tears. Thrice since Easter have I had petrol pipes come adrift from lightweight tanks, and in each case the petrol pipe embodied but a single whorl. The new pipe shall have three whorls, but I wonder why makers do not fit the petrol pipe vertically under the petrol filler hole, and put a locknut on a screwed internal extension of the stub?

A Reminiscence.

Some years ago, when variable gears were in their infancy, a leading firm of motor cycle manufacturers "tried out" a light compact two-speed hub gear devoid of any free engine clutch. It weighed about 4 lb., cost about 50s. in quantities, and entailed no changes in the size, design, or construction of the frame. It was interchangeable with the standard wheel of the machine in question, and the gears were changed by a tiny tank lever, the exhaust valve being lifted during all gear changes. The firm in question built up half a dozen of these gears into their wheels and set as many testers to knock the hubs about (entrusting one machine to me for the season). They proved too weak for the weight of their load and for the pull of a somewhat crude 500 c.c. engine, and the firm dropped them. Such a hub is just exactly what is wanted for the lightest and cheapest types of two-stroke "babies"; and I sincerely hope that the leading gear makers will place such a hub on the market before next season opens. A three-speed hub is not wanted in this class; it is too heavy and too costly. The men who buy the type of machine under consideration do not go hunting for freak hills, neither do they set a high value on speed. They simply require the lightest and cheapest accessory which will enable their wee engines to scramble up such hills as the Fish at Broadway, or Birdlip; and a luxurious and expensive gear will not appeal to them.

A Doctor's Complaint.

A middle-aged doctor asks me to recommend a decompressor for use with his 3½ h.p. Sunbeam. All through the summer he has been able to "walk his machine off" in a yard or two on middle gear, but now that the atmosphere is colder, he cannot do so, and he finds it difficult to operate the kick-starter, whilst he dislikes a run of several yards in his overalls. As the Sunbeam Company consider a decompressor unnecessary, he should be able to find a cheaper and simpler escape from his difficulties. I should advise the following expedients:

1. Practise with a kick-starter, aided by a demonstration from the supplying agent.
2. Use of a thinner engine oil.
3. Petrol injections.

I am not *certain* that a decompressor will help him very perceptibly. The sluggish starting may be ascribable to one or two causes. Either the piston is gummy with chilled oil, in which case his difficulty may be to get the magneto revolving fast enough for an easy start; in this case, a decompressor will certainly facilitate matters. Or his petrol may be slow to volatilise, in which case a decompressor will be of very little service, for a decompressor requires a rich starting mixture. In this case a readjustment of the carburetter or a petrol injection might be of the best service. If he experiences difficulty in restarting after *short* stops, a thinner oil should solve the problem. He will find several excellent decompressors advertised in our columns weekly.

A Warning about Modern Tyre Solutions.

We are all duly grateful to several inventors for the excellent tyre repairing solution which forms part of most modern outfits. My experiences this season indicate that the latest solutions perish far more rapidly than their less efficient prototypes, especially when they are put up in collapsible tubes, which are liable to air leaks. I doubt whether the modern solutions retain their fluidity very long even when they are stored in substantial screw-lidded "flasks," but I should advise users to prefer the strongest containers, to keep the lids as tight as possible, and to verify the condition of the contents from time to time. Two motor cyclists, who, on a recent occasion, paused to help me repair a puncture, discovered that their solution had dried up. Of course, it is usually possible to soften the solution with a little petrol.

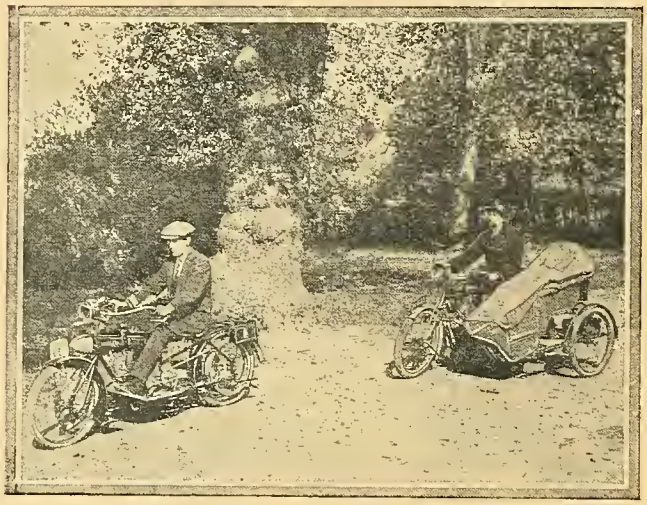
ENLARGED ISSUE. NUMEROUS ILLUSTRATIONS.

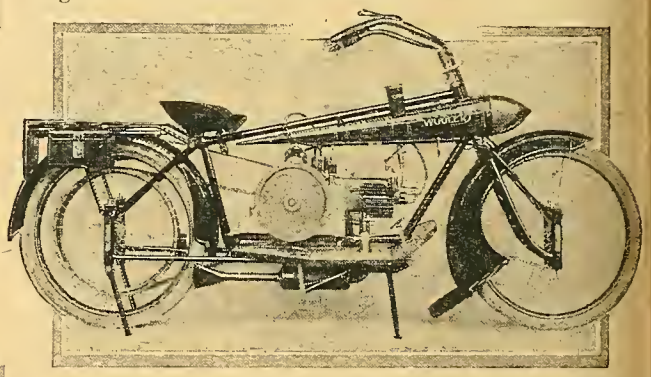
The Wooler Two-stroke in Town and Country.

A Trip into Surrey, Hants, and Sussex on a Machine of Unconventional Design



The Wooler two-stroke on the road at Park Royal.

IN our issue of July 30th an illustrated description of the Wooler two-stroke lightweight motor cycle was published, and we have been able since then to test the capabilities of this machine during a tour of about 170 miles. Real originality in design is rare where motor cycle design is concerned, and there is a decided display of grit in a firm which flouts conventions and does not cater solely for fashion. That the Wooler is unconventional can be demonstrated by summarising its most salient features. Its single-cylinder two-stroke power unit with horizontal cylinder and displacer piston, the unique transmission comprising a variable gear of sound construction, the front and rear springing which works so well in practice—all are of exceptional design, and we were glad to become acquainted with its behaviour on the road. The route selected led to South Harting, near Petersfield, but before reaching the Portsmouth Road it was necessary to make a journey across London, and only in one case was it necessary to "keep going" by the use of the lowest gear. Hyde Park Corner, Hammersmith Bridge, and Kingston were soon left behind, and then on the open road a steady 25 m.p.h. average could be maintained with comfort. Cobham was passed through with caution, for the Wooler looks, and is, a fast machine. It should be mentioned here that, although the carburetter was slightly out of adjustment, there was never any tendency for the engine to overheat or four-stroke, which shows the efficiency of a displacer piston in ensuring a good charge being forced into the working cylinder. A few miles before Hindhead was reached firing suddenly ceased and investigation revealed the total absence of any petrol in the tank. Apparently we were in for a somewhat strenuous time, for the nearest town was two and a half miles, but things looked brighter when an A.A. scout appeared in the distance. This worthy man rode five miles in all for a gallon of petrol. In spite of the strong head wind the ascent to the Devil's Punchbowl, Hindhead, was made on top gear. Petersfield and South Harting were soon reached, and the machine created much interest among the spectators at a hill-climb which was being held there. When this was over, with the wind behind, London was reached in very good time, with only one stop to replenish at Guildford. The XL'All pan saddle, in conjunction with the excellent rear springing device, was most comfortable.



The latest model 2¾ h.p. horizontal-engined Wooler

Ascending Hangar Hill, Park Royal.

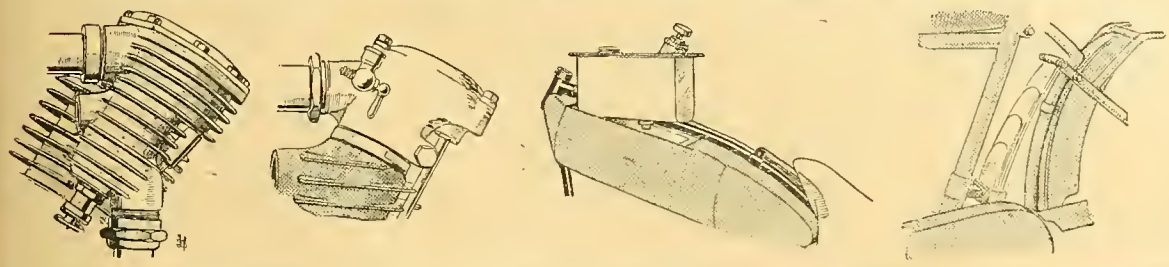
"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints, half-plate, 1/6 post free; mounted, 1/9 post free. This refers to photographs taken by "THE MOTOR CYCLE" operators.

Orders, which must be accompanied with remittance should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

The Trend of Design in America.

A Technical Survey from a British Motor Cyclist's Point of View.



(1) Thor enclosed inlet valve mechanism. (2) Enclosed overhead valve gear on Yale twin. (3) Dayton tank with separate oil compartment. (4) The Cyclone spring frame.

AS America is the only country which can be considered a serious rival to British supremacy in the motor cycle industry, a few notes on the 1915 designs as exhibited at last month's Chicago Show should prove of interest to both the riding public and trade of this country.

First and most important comes the adoption by several of the leading firms of the three-speed countershaft gear, a feature which the American designers have been slow to adopt. Its necessity on medium-powered mounts and its desirability even with high-powered engines have been proved in this country long ago, and some fine examples have been on the market for years, while for 1915 almost every machine designed for sidecar work will be fitted with three or four speeds. Sliding gears of the two pair of dog type are fast coming into vogue, though modifications in detail are, of course, to be seen. Cork insert clutches are the most common type, and kick, or (as they are known across the water) step, starters are generally incorporated.

High-powered Twins the Rage.

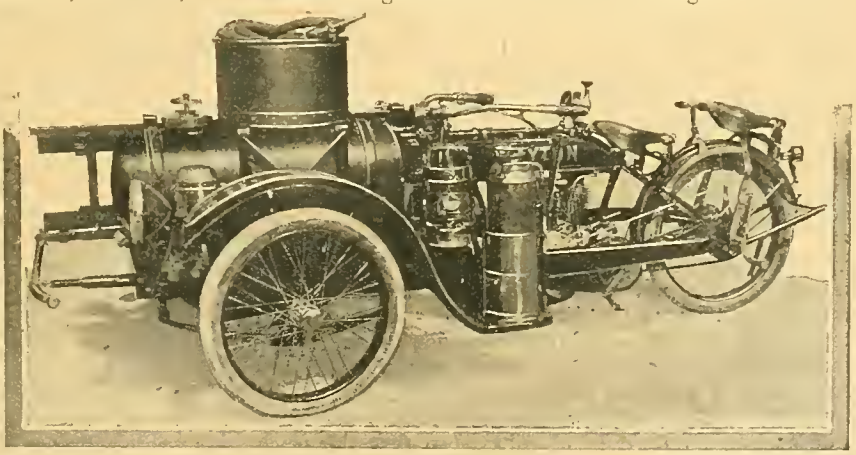
Big twins are the rage, and colossal engines rated at 8 h.p. and over are commonly in use as solo mounts. To British minds this would seem ridiculous, especially as in some parts the roads preclude high speeds. We must remember, however, that the general run of big American twin is not such a high efficiency engine as we are accustomed to in England. For the most part, a certain amount of efficiency is sacrificed for flexibility and smooth, quiet, slow running, a feature which has much to commend it, and which might reasonably be studied more by our own designers.

Overhead inlet valves are almost universal, and in the 1915 models the overhead rocking gear is frequently enclosed, something after the manner of the M.A.G. valve gear. More attention has been given to the design of valves and ports, with the consequence that engine power per capacity has increased somewhat. Chain drive is almost universal, though chain guarding has improved but little, and totally enclosed chains running in oil baths are almost unknown.

Forced Feed Oiling the Rule.

As regards engine lubrication, some form of forced oil circulation is usual, and in this respect we are sadly behind our friends across the water, though in passing it would seem that the Americans do not make anything like the full use of their oil pumps, and frequently only lead the flow to the front cylinder and do not force through to the bearings.

We find one or two fresh instances of dynamo lighting, but there is no sign of its general adoption, probably on account of the excellent service obtained from the dissolved acetylene cylinders which are in general use. Frames remain much as before. In the eyes of Britishers they are mostly very ugly, but they are also undeniably strong and are reinforced by liners in all important places. The loop frame is popular and has much to recommend it. Spring forks differ largely from our own, and are frequently of the cradle type, such as the Indian, Excelsior, etc. Rear springing has received a certain amount of attention, the Indian, Merkel, and Pope being possibly the most typical examples. As regards detail work British manufacturers are years ahead. Many American machines, for instance, have no carrier or else a poor crude arrangement which would be laughed at in this



Tricar fire engine just placed on the market by the manufacturers of the Dayton motor cycle. This "fire fighter" is equipped with a large chemical tank, as well as hand extinguisher, ladders, lantern and hose. It has electric lights, and tandem seats are provided—quite a healthy load for an air-cooled twin.
